I prefer that other pens than mine write of the work thus far accomplished in the National Catholic Church. Its influence extends far beyond my acquaintance, which shows to me that the movement is spontaneous. I have adhesions with several thousand names from provinces I never saw; letters come from remote places. All the newspapers, with the exception of the official organs of the Roman Catholic Church, are favorable to the movement and print articles, correspondence, my pastoral letters, and their views on the religious situation, all anti-friar. My own official paper, *La Verdad* (The Truth), reached a circulation of 10,000 copies per week, spreading information. My priests have traveled extensively. I have more invitations than ten men can fill. The interest is widespread, and has been intensified by Papal Delegate Guidi deliberately changing the promise in the new Papal constitution, granting four Filipino bishops. It has had the effect of creating a new division in what was left to the Roman Catholic Church. In Ilocos Sur a year ago six priests came out of Rome and joined the Independent Catholic Church. The remaining twenty priests decided to wait for developments. They have now held an assembly, and in a united body left the Church of Rome. The same has recently happened in the Island of Panay. Fifteen priests declared for our Church, and now the remaining forty-five Roman Catholic priests have, as a consequence of this new deception on Papal Delegate Guidi's part, left the Roman Church.

Some of these forty-five will probably enter the Protestant Church, as the preachers of the Baptist faith have great influence in Panay Island. It is very clear that there is a universal agitation, caused by the fear that the friars will stay, and that American bishops will come to aid the friars. It is my opinion that when the American bishops really land the opposition to Rome and the Pope will increase.

I have thus far consecrated ten bishops. One of these, Bishop Jose Evangelista, who has charge of Manila, directs a theological seminary. He has ordained fifty-eight young men to the priesthood, presbyters, deacons, and to minor orders. By Bishop Pedro Brillantes who is in charge of Ilocos Norte, where, with one exception, all the parish churches and convents and priests and all the people are of the Independent Catholic Church, eighteen were ordained, and another class is being prepared. Bishop Adriano Garces, of Pangasinan, has charge of the theological seminary at Dagupau. He has a class nearly ready for ordination. Some of his candidates were included with those ordained by Bishop Jose Evangelista.* We have more requests to send priests than we can supply, but are doing the best possible under the circumstances.

I refrain from detailing all the difficulties and obstacles that were necessary to be overcome, especially as the people, being intensely Catholic, were very loath to cut loose from their mother church and faith in the Pope. Very few realize what it costs to do this, and what our feelings in the matter are. Besides, there was a general expectation that some concessions would be made to the people. But all this is now settled; the die has been cast. We are a separate organization, to perfect which is no small task.

I attach but little importance to the so-called "Friar Land Negotiations." Absolutely no interest is taken in the matter here. We distinguish between the land acquired for cultivation and the church buildings and parsonages (convents). Some of their plantations have good titles; there is no question as to the own-

* Bishop Narcisco Hijalda, of Antique Province, in the north of Panay Island, reports having ordained twenty priests (since this article was written).

ership of these. If any have faulty titles, or were falsely acquired, the courts of the islands can determine this. Any dispute between tenants and friars can be resolved in the courts. With the millions of acres of uncultivated Government land lying idle which is available for friar land tenants who are dissatisfied, it appears to me that no one is forced by circumstances to depend on the friar plantations for a living. Therefore, beyond showing a disposition to please the Catholics in America, I fail to see the importance of the land claimed or owned by the friars.

A confusion has been caused by including the church buildings and convents in this matter. These are the indisputable property of the people. Every dollar of money was collected by the Government of Spain by taxing the people to erect the churches, and the labor was done by "*polista*," each person being compelled by the Government to work fifteen days or pay the equivalent. There is not a human being in possession of his senses, knowing the facts, who would suggest that because the Roman Catholic priests were servants of the state that therefore state property belongs to an Italian in Rome. By the same logic the jails belong to the jailers and the town halls to the mayors. Rome never put a dollar into the parish buildings. They were the property of the Crown of Spain, under a state religion

administered for the Government by Roman Catholics. This ownership passed over to the United States of America by the treaty of Paris. And who will dispute the justice of the United States holding this property in trust *for the people*? Is it necessary that the people be Roman Catholics to be citizens? Does the Government owe nothing to Independent Catholics? Suppose the test were made that where two-thirds of the people are Roman Catholic, there the Archbishop of Rome can use the Government building, and where two-thirds have renounced Rome, there the Independents appoint their priest and be allowed to use the Government church? I know there is a record of church property. This sustains my contention. I am not seeking to prejudge what will be done by the officials. I simply state what I believe is their just duty. I frankly state that we are in peaceable possession of over a hundred churches, and there is no suggestion that we shall be forcibly dispossessed. But the question is held in abeyance; it is not yet settled.

Assuring you of my endeavors for justice in Church matters and peace on earth, by supporting just governments, and believing that God is more than creed, and that Jesus never excommunicated any one, I am, as your server,

GREGORIO AGLIPAY.

MANILA, PHILIPPINE ISLANDS.

Laus Diis

BY CLARENCE URMY

THE gods be praised! The gods that reign
In robust heart and healthy brain,
That wield a brush or pen or sword
In Truth's defense, in Truth's accord,
The gods that ride the hurricane!

Raise high a loud, exultant strain,
A battle-song of Passion slain:
"Good triumphs o'er Sin's hateful horde,
"The gods be praised!"

For Lips that scorn a smut or stain,
For Toil that's born of Might and Main,
For Hope that aureoles Reward,
For Glory high in Heaven stored—
Shout, shout again the glad refrain:
"The gods be praised!"

SAN JOSE, CAL.

Literature

The Encyclopædia Biblica

THE last volume of this work* is the thickest of the four, and brings to conclusion a great and important enterprise. The publishers deserve great praise for their courage, especially as Dr. Hastings's rival Dictionary of the Bible, of very nearly the same dimensions, was a little ahead in the market.

Of course, we must compare the two works. Both are an honor to the skill and scholarship of the editors and contributors, and either will be a most valued accession to any library. Both are liberal in their theological position and recognize the value of late conclusions of the critical school, but the *Encyclopædia Biblica* is much more advanced than the work edited by Dr. Hastings. Indeed, it belongs to the extreme school, and will be of value as showing whither criticism is tending. The principal writers, with Professor Cheyne, really recognize no supernaturalism or miracles. This is true in reference to the New Testament as well as the Old. Our Lord was a man, the son of Joseph and Mary, a great teacher and reformer, about whom many a legend had grown, and who died and did not rise again, except in the imagination of his disciples. They thought they saw him, but theirs were all "subjective visions," like that of Paul on the way to Damascus. Such a conclusion as this was to be expected when Schmiedel was chosen to write on "Resurrection and Ascension Narratives." The same extreme critical view runs through all the articles on the Gospels and Epistles, especially those by Von Manen. So we must not be surprised to be told by Schmiedel that the story in Acts that Simon Magus attempted to purchase of Simon Peter miraculous gifts was an attempt by the author to relieve St. Paul of a similar charge. An American scholar, Professor Schmidt, of Cornell Uni-

versity, in his articles on "Son of God" and "Son of Man" tells us that Jesus used these titles of himself in no peculiar sense to differentiate himself from other men, who are equally sons of God and equally men, and that he did not claim Messiahship. The learning with which the advanced views of Professor Cheyne and his associates maintain their views is extensive and minute, and well worth the attention of all impartial scholars.

On one point we agree with all previous critics of the preceding volumes; it is in lamenting the monomania of Professor Cheyne as to his Jerahmeel theory. There was an old, extinct tribe of Jerahmeel, that lived in northern Arabia, recognized in the early documents used in the composition of the historical books of the Old Testament; but, says Cheyne, it has everywhere been eliminated and other names put in its place wherever it occurred. Pretty much every article signed by Cheyne has this "Jerahmeel" in it, until the notion is carried to the extreme of ludicrousness. So "Gomer" represents "Jerahmeel," and so does "Ulai," and "Chebar," and "Adam," and "Mahaleel," and "Lamech." Indeed, Cheyne is perfectly wild in his corrections of the Hebrew text. One illustration must suffice; he changes the names of the two sons of Sennacherib, who murdered their father, Adrammelech and Sharezer, to make it read "Jerahmeel, prince of Asshur," meaning an Arabian Asshur.

We venture to call attention to several errors or oversights in otherwise admirable articles. There is no evidence in early Babylonian art of human sacrifices (col. 4, 183); the contrary supposition comes from a misunderstanding by Menant; Sargon the Elder should have been attributed to the fourth and not to the third millennium B. C. (4288); under "Sidon" the earliest mention of the name in Phenician inscriptions is said to be in the time of Hiram II. It occurs on two Sidonian seals that are centuries older. In a table, under "Precious Stones," it is stated that porphyry and

* ENCYCLOPÆDIA BIBLICA. A Critical Dictionary of the Literary, Political and Religious History, the Archæological Geography and Natural History of the Bible. Edited by the Rev. T. K. Cheyne and J. Sutherland Black. Vol. IV—Q to Z. New York: The Macmillan Co.

felspar and amethyst were known to the artists of the earlier Babylonian period. This is hardly true; what is called by certain French archeologists porphyry was really a black serpentine. Quartz crystal is said not to be found of that period. We have it in seals of the period of Gudea, 2800 B. C. What is called emerald, or beryl (col. 4803 note) is neither, but is Amazon stone. That the *shoham* stone (4808) was green malachite we cannot admit, in view of the fact that it is not found in seals. Petrie is nearer the truth in supposing it to be green felspar (Amazon stone). That *onyx* (4809) comes from Assyrian *unku*, a ring, is extremely doubtful, notwithstanding the reference to Delitzsch's dictionary here and under "Stone of Tarshish." We know of no "whole rings" of either "quartz" or "chalcedony" until much later in the Sassanian period. But such minor corrections as these are insignificant in view of the abundant scholarship of the work.

Autobiography of Leigh Hunt

CARLYLE was willing to call Leigh Hunt's reminiscences* "an excellent good book, by far the best of the autobiographic kind" he remembered to have read in the English language. That was strong praise to issue from the beligerent sage, and, as it was addressed to the author himself, may have been inspired by a somewhat unusual desire to temper truth with benevolence. Yet, even to-day, one does not know where to turn in English for an autobiography more genial and entertaining, more filled with pleasant recollections of great personalities. And withal it is a brave and cheerful piece of writing. To Carlyle the book was "like a written exercise of devotion," the story of "a gifted, gentle, patient, and valiant human soul." American readers might even take a little patriotic pride in the work, for Hunt's father was a student at Philadelphia and New York from the Barbados, and his mother was Mary Shewell, the daughter of a Philadelphia merchant. The poet son just missed—or escaped, we fear

he would prefer to say, for the family took the wrong side in the Revolutionary War, and, finding it expedient to sail to England, retained no great love for this country—Leigh Hunt himself just missed being born in America.

The most interesting parts of his Autobiography are those that relate his life in Christ's Hospital, which he entered just after Lamb and Coleridge, the inspired charity boy, and those that describe his great friends as he saw them—in undress, so to speak. There is the poet Campbell, whom he portrays as a "French Virgil," and Keats, with his broad shoulders, slender limbs, pugnacious mouth and small head; and Shelley, whom he adored; and Byron, whom he vilified in a book, but afterward treated more respectfully in these memoirs. It may not be amiss to quote this picture of the noble lord as Hunt lived with him and knew him in Pisa:

"Our manner of life was this. Lord Byron, who used to sit up at night writing 'Don Juan' (which he did under the influence of gin and water), rose late in the morning. He breakfasted; read; lounged about, singing an air, generally out of Rossini; then took a bath, and was dressed; and coming downstairs, was

LEIGH HUNT (aged 66)

From a Drawing by W. F. Williams

* THE AUTOBIOGRAPHY OF LEIGH HUNT. With Thornton Hunt's Introduction and Postscript. Newly Edited by Roger Ingpen. 2 vols. New York: E. P. Dutton & Co. \$7.50 net.

heard, still singing, in the courtyard, out of which the garden ascended, by a few steps, at the back of the house. The servants, at the same time, brought out two or three chairs. My study, a little room in a corner, with an orange tree at the window, looked upon this courtyard. I was generally at my writing when he came down, and either acknowledged his presence by getting up and saying something from the window, or he called out 'Leontius!' (a name into which Shelley had pleasantly converted that of 'Leigh Hunt') and came up to the window with some jest or other challenge to conversation."

That gives a good notion of the more familiar pages of the book, but there is no lack of material of a different sort in it. In old age, as he is seen in the drawing by W. F. Williams, Hawthorne met Leigh Hunt while visiting "Our Old Home," and describes him as "a beautiful and venerable old man, buttoned to the chin in a black dress-coat, tall and slender, with a countenance quietly alive all over, and the gentlest and most naturally courteous manner." Those who have formed their conception of Hunt from Dickens's gross caricature in "Bleak House," and have not read the Autobiography, have now an excellent invitation to mend their opinion; for the publishers have brought out these two volumes in the handsomest shape, with good photogravure portraits of the principal persons mentioned.

A Prisoner's Record

THIS little book * is an account of the experience and observations of a member of "society" in England, sentenced in 1898 to the maximum penalty of five years for fraud, and, with the maximum reduction for good conduct, serving three years and nine months actual time in Parkhurst Convict Prison, Isle of Wight. There is nothing sensational in the story; the circumstances of the prisoner are more romantic than his narrative, which, however, furnishes facts for comparison and judgments for reflection, and a description of men and methods, that have their interest and undoubted use. The whole is written in a plain, brave way, with marked moderation and control, and offers the testimony of a competent and

sensible reporter. Moreover, the man is not afraid to apply to personalities and to conditions his definite and particular praise or blame; and especially, and deservedly, do the press and the judiciary come in for his stern condemnation. Indeed, his remarks upon the inequality of sentences (with the necessity for "standardizing" them), and upon the stupid, brutal, bigoted and arbitrary decisions of British judges, carry us back into the centuries of recorded court procedure, and make us wonder at the long-suffering of this much tolerating land. But these strictures are offset by the excellent character given to the lesser prison officials, as well as to the chaplains (the Catholic pre-eminently, of which communion he considers himself to be a fortunate member), and to the inspectors and directors of prisons, who are a credit to our common nature. His revelations as to deficient feeding characterized as a system of "organized starvation," and to the cheating by contractors and complicity of stewards, arouse indignant interest; but his evidence to the lenity of discipline and clemency of administration, and the improvement, very slow but sure, in penal practice, console and reassure. His recommendations, also, as to a "graduated scale" of remission of sentences, and to the care and conduct of prisoners as regards separate confinement, labor, exercise, reading, writing and sociability, are valuable, and sometimes anticipate the suggestions of the commissioners of prisons. The characters of the different classes of convicts are accurately and tolerantly depicted; the danger from the "balmies" or incipient lunatics; the malicious mischief of the "coppers or informers," often in danger of their lives from the just resentment of the prisoners; the humors, and occasionally the horrors, of the situation are touched upon, and interesting incidents of human nature added to our store of experience derived from other people. After all, we find that human nature is much the same in prison and out, tho stronger emphasized and perhaps plainer revealed in confinement; there is the mean man, the selfish man, the really "bad man," and the impulsive criminal or criminal of circumstance, pathetic or attractive as the case may be.

* PENAL SERVITUDE. By W. B. N. (Lord Wm. Nevill). New York. G. P. Putnam's Sons. \$1.50.

The author also contributes certain dry and seemingly unconscious humors of his own, as that the sermon to-day was "above the heads of the congregation," that the prisoner knows more about the inner working of the prison than the Governor (which is undoubtedly true), and that every judge ought himself to undergo a term in prison so that he may know what his punishments really mean and how they affect the dispositions of different persons. The value of kindness is well brought out, and the personal influence of an official upon the prisoners; indeed, psychology and sociology, as well as penology, find here their tribute. And caricatures of justice are indicated that remind us of Dickens, whose day is evidently not done yet in certain sections of British society; for example, "the committal to prison of young children, dying people and paupers who are physically unfit for work." On the whole, while this is no tale for the idle reader, being deficient in excitement for his overstimulated palate, it is replete with information and suggestion for the experienced and prudent student in several of the departments that deal directly with humanity; and, while at first appearance comparatively barren and unrewarding, it steadily grows in information and importance to the end.

The Maids of Paradise

IN this novel we have not only a thrilling romance—the very heart of it is a love story—but have the best book of historical fiction that has appeared this year. The opening scenes are laid in the frontier village of Marsbronn, in the province of Alsace, at the beginning of the Franco-Prussian War. And not since Zola wrote his description of the battle of Sedan has such a picture been written of war.

Some of us still remember Stephen Crane's representation of regiments advancing through the blue smoke rims of red fields, but, after all, there was too much regularity about the charge and too little history behind it to make the scenes significant. Mr. Chambers, however, goes a step further in the art of interpreting war. The black-snouted can-

non that wallow through shallow river fords and crawl slivering along the narrow streets of Marsbronn draw after them the whole history of France to its imperial close. And the author has not only the pictorial style, a gift of words that shade and shine over valleys and vineyards and mountain peaks, but he is able to give a meaning to all these things that sweeps the imagination into the very heart of a country about to be sacrificed. And when the battle begins with the violence of a great storm torrent confined within a narrow space, nothing essential to the magnificent tragedy is omitted, from the movements of the Prussians constructing the fatal barricade to the cavalry-crowned hills of French heroes who rushed madly to their doom. Every shell falls visibly upon the page; above the spiteful din of rifle firing, cannons boom out incessantly. Nor are the final psychic features wanting when the whole regiment lies mangled and dying before the fatal barricade. Men, dazed by the sudden catastrophe, stumble over the dead and stare stupidly into the faces of their enemies, knock vaguely at the doors of houses evidently filled with Prussian soldiers, or sit unconcerned upon the ground. The whole sickening sight is written out in sentences that seem to point like bayonets.

But this battle imagery is not the only triumph in the book. The average historical novelist, having once struck the keynote of desperation, is in his element, and never loosens his grip on the reader's nerves until the last man escapes narrowly or is assassinated in the concluding chapter. Apparently he does not comprehend that stupefaction succeeds real or imaginary emotional excitement, and so he hurries us from one scene of carnage to another until the mind revolts at the insistent strain and actually loses interest in the whole performance. But the true artist prepares for the reaction, recognizes the necessity of a return to the sanity of silence, peace and the commonplace. Thus Mr. Chambers cunningly shifts the scene of his story from the soldier-glutted town to the remote Breton village of Paradise, where maids and love play their part in the drama. The interest is not lessened; it is founded upon the natural order of things rather than upon great military movements.

* THE MAIDS OF PARADISE. By Robert W. Chambers. New York: Harper & Bros. \$1.50.

The reader's mind is refreshed by the change, and it is difficult to say which is the better half of the story.

Poems. By T. Buchanan Read. Three vols. Philadelphia: J. B. Lippincott Co., \$3.75.

The poems of Buchanan Read, once so widely quoted, have long been out of print, and a new edition in neat and convenient form, made more complete by the addition of several unpublished pieces, is a work of *pietas* from his old publishers. "Sheridan's Ride," with its quick movement and stirring refrain, used to be one of the inevitable school recitations, and may still be, for aught we know, in some districts. So, too, everybody has heard and remembers the deft stanzas of "Drifting":

"I heed not, if
My rippling skiff
Float swift or slow from cliff to cliff;
With dreamful eyes
My spirit lies
Under the walls of Paradise."

But the most of Read's poetry is, we suspect, not very well known to-day. It is too quiet, pitched in too low a key, for the present taste. On rereading "The Wagoner of the Alleghanies," and more particularly "The New Pastoral," one is struck by something similar in tone to the picture of Pennsylvania life in the novels of Bayard Taylor,—the same idyllic light is on the fields, so soft and pure that it cannot be distinguished from realism. And, as in the case of Bayard Taylor's stories, one expects to be bored, but reads on and is really interested. Some of the shorter poems have a quiet grace and truthfulness possessing genuine charm.

"The winds unkenneled round the casements
whine,
The sheltered hound makes answer in his
dream,
And in the hayloft, hark, the cock at nine,
Crows from the dusty beam.

"The leafless branches chafe the roof all
night,
And through the house the troubled
noises go,
While, like a ghostly presence, thin and
white,
The frost foretells the snow."

The Law of Life. By Anna McClure Sholl.
New York: D. Appleton & Co., 1.50.

This novel sets forth the esoteric side of social life in a great American university. The characters belong to that most exclusive of all circles, the university campus, men and women who by some sense of exclusiveness keep aloof from the world about them, while they invariably run the same gamut of emotions. And the author's interpretation of the sex element under such circumstances is painfully sincere rather than pleasantly romantic. The story is really based upon the mischance which unites a woman of sensitive, elemental nature to a dry-as-dust student, and it proves that while the tragedy of such a marriage may not be made manifest, it is inevitable. And it is at this point that the book differs from the average society novel, where the married woman who loves some other man than her husband is usually a sinister character. But in this instance the university atmosphere of high thinking gives the poor heroine a moral perspective that preserves her faithful to the *Law of Life*.

The Way of the Sea. By Norman Duncan.
New York: McClure, Phillips & Co., \$1.50.

No one to-day in America writes more subtle English than Mr. Duncan, and no one can reproduce more precisely the elusive impression of a complex situation which we call atmosphere. His volume of stories on the Syrian quarter of New York proved that, and the present work is further confirmation of it. Mr. Duncan has spent some time on the wild coast of Newfoundland, where "inevitably, from generation to generation, the people of that barren match their strength against the might of tempestuous waters, fighting with their bare hands—great, knotty, sore, grimy hands; match, also, their spirit against the invisible terrors which the sea's space harbors, in sunshine and mist, by all the superstition of her children." It is the terror, the alluring treacherous mystery of the sea, that Mr. Duncan has chiefly reproduced in these tales,—the impression not, we suspect, of the actual toiler, who struggles with tide and wind, but of the sensitive onlooker, to whom the sea takes on something of personal mood and temper from

its very unfamiliarity. The impression is perfectly legitimate and has been used in these stories most effectively.

Literary Notes

THE Poetry of Thomas Moore, selected and arranged by C. Litton Falkiner, has been added to the Golden Treasury Series. (The Macmillan Company.)

....The Burrows Brothers Company issue a reprint of John Eliot's "Indian Logick Primer," from the only existing copy, now in the British Museum. (\$6 net.)

...."The Parliamentary Pathfinder," by William H. Bartlett, is a quick reference manual of Rules of Order for deliberative assemblies. (Thomas Y. Crowell & Co., 45 cents.)

....The Oxford University Press is publishing a new edition of the Letters of Horace Walpole (the first for nearly fifty years), edited by Mrs. Paget Toynbee. More than a hundred letters, never before printed, will be included in this elaborate edition.

....Two more volumes of the new Library Edition of Charles Kingsley, edited by Maurice Kingsley, have appeared, containing "Two Years Ago." If this handsome edition will withdraw a host of readers from modern flim-flam to Kingsley's sturdy novels it will do well. (J. F. Taylor & Co., \$2 net a volume.)

....Two volumes of The Temple Autobiographies are given up to a new translation of "The Life of Benvenuto Cellini," by Anne Macdonnell. The books are illustrated and are as pleasant in general make-up as was to be expected in a "Temple" publication. (E. P. Dutton & Co., \$2.50 net.)

....One more of the great Victorians who combined the labors of statesman and student has passed away. On the night of October 22d William E. H. Lecky died in London of heart disease. He was born near Dublin in 1838. In Trinity College, Dublin, he was educated, and later he stood for the University in Parliament. His chief historical works were "A History of European Morals from Augustus to Charlemagne," which was published in 1869, and has since become a text book in several German universities, and his great "History of England in the Eighteenth Century," in eight volumes, published in 1878-1890. Mr. Lecky was one of those who introduced philosophy into English history. For the most part, he writes in a vein singularly simple and unadorned, but at times, notably in that often quoted passage concerning "the social question," his style glows with restrained passion. His ear-

liest work, on "The Leaders of Public Opinion in Ireland" has been brought out recently in a new edition.

Pebbles

OUR idea of a clever person is one who can say something bright down an ear trumpet.—*Atchison Globe*.

....*Grocer*: "Look here, young man, I'll run up a bill against you if you don't stop sampling my goods." *Boy*: "Oh, not at all; there's no accounting for tastes."—*Yale Record*.

....*The Curate*: "So the thief overlooked your vest in the vestry?" *The Rector*: "Yes, but stole my stole and every surplus surplice." "Pshaw! It's a wonder the knave left the nave."—*Life*.

You may crush, you may shatter
The vase if you will,
But the folks who say vahse
Will be saying it still.

TURN ABOUT.

Though noisy ills annoy us much
And mar our simple joys,
No noisy ill annoys like this:
Chicago, Illinois.

—*Philadelphia Press*.

Once Philadelphia went to sleep,
It slept—is sleeping still.
And though it sleeps, of sleep, they say,
It never gets its Phil.

—*Chicago Tribune*.

....The judge of one of the United States Circuit Courts has a five-year-old niece of whom he is very proud. A few days ago she came to him and said with a very serious air: "Uncle, there is a question about law I want to ask you." "Well, dear, what is it?" patiently inquired the judge. "Uncle, if a man had a peacock, and it went into another man's yard and laid an egg, who would the egg belong to?" The judge smiled indulgently, and replied: "Why, the egg would belong to the man who owned the peacock, but he could be prosecuted for trespassing if he went on the other's property to get it." The child seemed very much interested in the explanation, and then observed innocently: "Uncle, did it ever occur to you that a peacock couldn't lay an egg?"—*The Law Review*.

Editorials

The Campaign in New York

As election day in New York draws near, there is much in the situation to encourage the Reform party, but not enough to warrant absolute confidence in a reform victory at the polls. The large registration (615,000 voters) is favorable to the reform cause. Democratic revolt in Brooklyn against the attempt to extend Tammany's vile rule over the party organization in that great borough, altho possibly unsuccessful, cannot fail to help the reform ticket there. Tammany's campaign arguments and pleas are so wide of the real issue, so absurd, or so involved in contradictions that they can have no weight with men who are intelligent and also honest. The record of the present administration has been admirable; that of the Tammany government which preceded it is known all over the world to have been infamous, and those who now seek to regain the power that was lost two years ago are led partly by the men who controlled the Van Wyck administration, partly by other men who are no better. Of course, there should be no room for doubt as to the result of this contest between honesty and decency on the one hand, and corruption and infamy on the other; but the victory has not yet been won.

We published last week Mr. Gustavus Myers's clear and comprehensive account of what Mayor Low and his associates have done, and of the organized piracy of the preceding term, in which \$12,000,000 per annum was collected in black-mail, licenses for crime and vice, and other varieties of "graft." Against the argument obviously suggested to a civilized man by such a showing, Tammany sets up the plea that a partisan Democratic victory in the city is needed for the encouragement of the Democratic party throughout the country next year. All shrewd politicians know that Tammany, merely an association of municipal pirates wearing the mask of partisan Democracy, has for many years been a

dragging weight at the neck of the national party, which has always been handicapped by its victories. Tammany's infamy is continually making Republican voters in New York and throughout the land. But many thoughtless men are caught by this partisan cry, raised by robbers whose only purpose is to loot the town. To make it more effective with such voters, Tammany's leaders now assert that the Reform administration has become subservient to Senator Platt and the Republican party. When one points to the dreadful record of the "red-light" district, they reply that the leader of the Citizens' Union is interested in a beet sugar factory, and falsely say that he opposes the treaty of reciprocity with Cuba.

That eloquent Hessian orator, Mr. Bourke Cockran, wildly declared in a public address that the Reform government is "the worst we have had since the fall of the Tweed ring," forgetting that the Tammany for which he was speaking had taken for its own candidate Comptroller Grout, an important officer of that government. Forgetting, also, that Mr. Grout was immediately to follow him on the platform, he savagely denounced the new system of taxation, for which the Comptroller is chiefly responsible. We refer to this merely to show the reckless and self-contradictory character of Tammany's political arguments. The interesting fact that such arguments and assertions commended themselves to ex-Secretary Whitney, Mr. Belmont and other prominent persons who sat in the boxes at that meeting suggests some of the forces against which the Reform party is contending.

Municipal franchise corporations and their treasure chests are the most formidable foes of the Fusionists. Why? Let Mayor Low answer:

"By one friend I was told of a corporation that had made a large contribution to the funds of Tammany. One of its officers, on being asked why, said: 'That is business.' He was then asked if he had given to the other side. 'No,' he said, 'that would not be business,' and when he was asked why not, he said: 'Because

if Mr. Low is elected, if we want anything that is right, we shall get it without paying for it. And if we want more than what is right, we cannot get it, no matter what we pay.'"

At last accounts the Fusionists had been unable to raise a needed fund of only \$45,000 by appealing to the public, but Tammany's coffers are full. Mr. Low's Government has given away no franchises, nor has it sold any corruptly. It has compelled the street railway companies to pay nearly \$1,000,000 in taxes long overdue. It is now suing for nearly \$2,500,000 more. Tammany did not strive vigorously to collect such debts. The Reform Government was unwilling to submit to the extortionate charges of the gas and electric lighting monopoly, and at Albany it asked for legislation that would permit the setting up of a municipal lighting plant. It was defeated there by Tammany legislators, mainly by the Senator who is now striving to Tammanyize Brooklyn. The hostile influence of the franchise corporations and of their campaign contributions is a force that must be taken into account in this fight, which even Boss McLaughlin, of Brooklyn, calls one of "decency against crime, purity of life against 'red-lightism,' honesty in public office against 'graft.'"

The indications are not all that could be desired, but at the present time they point, we think, to the election of the Reform candidates, altho we cannot expect a large majority for them. Experimental canvasses have disclosed many changes that are not easily explained. These tend to prevent the making of trustworthy estimates and forecasts. If the present Government is sustained, good men everywhere will have cause for rejoicing in the defeat of as wicked an association of conspirators as ever menaced the welfare of a great city. If, on the other hand, this band of political buccaneers shall again obtain control of \$100,000,000 of annual expenditure, with all the agencies for repressing vice, preserving health and promoting the well-being of nearly 4,000,000 of people, then the responsibility for this lapse into the mire should be placed where it will belong—not upon the ignorant who have been misled, nor upon the poor who have yielded to influences which the well-to-do can easily

defy, nor upon those who want Sunday beer, nor chiefly upon the saloon-keepers whose licenses have been increased by a State law, and the vicious who prefer a corrupt and wide-open city, but upon the intelligent and well-to-do, whether in franchise corporations or out of them, whose influence and contributions and votes shall have turned the scale at the ballot boxes for restoring the foul and degrading conditions out of which New York was lifted two years ago.

The Higher Fakirism

THE last half century has offered wonderful opportunities to the student who would penetrate into the mysteries of popular faiths that are accepted in sincerity by multitudes, while to other multitudes they remain preposterous.

Some of these faiths have been religious, others economic, yet others political. The spectacle has been witnessed of hard-headed men selling all that they had to take up life in a desert as followers of a prophet, who led them back from religious liberty into bondage to authority, and from the social organization of a ripe civilization into the patriarchal system of barbarism; of women who had married in love and purity of heart willingly and even fanatically consenting to see their husbands take other wives, and loyally helping them to solve the practical problems of a polygamous household. The strange conduct has been seen of men and women, too skeptical to assent longer to the creeds of Christianity, yet believing that surviving spirits of good men and great come back from the realm of shades to communicate with mortals through the mediumship of vulgar women. The astonishing possibility has been revealed that wives and daughters of keenly intelligent men in the very centers of Western civilization, accustomed daily to social intercourse with minds alert, practical and fearless, can go daft in spiritual submission to Hindu swamis; while the Brahmins of Boston, turning their faces from the Light of Asia, can burn native American incense at the occidental shrine of Mrs. Eddy. The devotion has been displayed of an

entire City of Zion shutting up shop to journey in special trains half way across a continent, at the command of an Elijah who drives three thousand dollar horses as nonchalantly as if he were a Chicago pork packer. The conviction that prosperity can be created by paper money and repudiation has even been seen to sweep, like a mania, over whole commonwealths, and a great political party has been found groveling at the feet of a savior of society, shedding tears over the crucifixion of humanity on a cross of gold.

Phenomena like these were not understood, could not have been understood, in the days of Peter the Hermit, or yet of John Law. They have become comprehensible only through those analyses of the more or less unconscious side of mental action which modern psychology has achieved, and through broad comparative studies in sociology, which have disclosed the constant factors universally present in unreasoning popular excitements. It must be accounted a great good fortune to science, if not to humanity, that these vast delusions have not ceased to arise and to run their course in modern times, exactly as in earlier days. Our knowledge of the human mind and of the social system in which we have our being would have been deplorably incomplete had such material for investigation ceased to exist just at the time when scientific conceptions and methods were ready to penetrate and to illuminate what once was wholly mysterious.

In the knowledge of such things that we now possess three or four elements stand conspicuously forth. The masses of men, even in these days of riotous prosperity, of liberty and of happiness, lead lives in which the note of tragedy never ceases to sound. Suffering and disappointment, failure and death are still the human lot, as in all the ages of the past.

Only to the few is given the power to find in straightforward thinking, in scientific comprehension, in philosophic acquiescence in the order of the world, a steadying power that enables them to go quietly forward with their daily tasks, content to do their duty as they see it, and to achieve such happiness

as may be given to them to enjoy. The majority must have alleviation and promise. They grasp at any assurance that is authoritatively presented. They are all too ready to accept the leadership of any self-confident guide whose own poise and steadfast faith are full of reassuring comfort.

Upon such elements of hunger and of faith there are always fakirs to play; and with rare exceptions the more or less great personalities that play upon and organize them are fakirs. The man who merely for material gain, or for political advancement, plays upon human fears and longings by mere trickery, is the fakir in ordinary, a vulgar wretch, whose thin deceits are quickly broken through. These men not infrequently attempt to direct great movements, but they fail. The really great delusions, that result in serious social changes, are led by fakirs of a higher sort. The distinguishing mark of the fakir extraordinary and sublime is his own unmistakable faith in himself. He does not merely pretend to be amazed, he is amazed, when men doubt his honesty. His mind teems with thoughts that hold him enthralled with visions of redemption or of reform, and these sway him as the whirlwind bends the oak. It is impossible for him to doubt that such thoughts, such visions, are of more than human origin, that they have been divinely revealed, or that at least they are stages in the onward sweep of some great tide of destiny. The devices that he uses, and which skeptical men cannot distinguish from the trickery of the fakir ordinary, he falls into as unconsciously as he drops into tremulo when holding thousands by his oratory. As Dowie puts it, all this is a "Tremendous Fact," and in the belief of the higher fakir it has been imposed upon him by God himself. "Had we been deceived in this matter," says Dowie, "then God would have deceived us. That is an impossibility."

A tremendous fact, indeed, these things have been, and will continue to be. In all human history there has been no more powerful force in operation than the higher fakirism; and many more ages will pass before it will cease to play its part in the affairs of men.

"Diamonds on Easy Payments"

WHEN some historian of the future tries to reconstruct the social conditions of our own times, *ex pede Herculem*, from such hints as he can gather from our periodical literature, especially from the advertisements, which are more reliable for that purpose than the news matter or the editorials, he will find the words "Diamonds on Easy Payments" most suggestive. It would be interesting to know what conception he will get of a state of society where people who could not afford them bought diamonds.

According to our scientific prophet, Mr. H. G. Wells, the most remarkable achievement of the present age is "the discovery of the future," and there seems to be some truth in this in financial matters. The bank of the future is not a concern of limited liability, and we can make drafts on it for any amount, and generally get them discounted immediately. Our unborn children build our railroads and pay for our water works. Boom towns have often been accused of including graveyards in the census, but, however that may be, they certainly get posterity to pay most of their taxes. Time was when a man wanted a cyclopedia he began to save up his money to that end, depriving himself of present pleasures for future benefits. Nowadays he gets the cyclopedia at once, leaving the full payment for it to some future time when it will be worn out or out of date. People have always borrowed trouble from the future, but it is only recently that they have learned to borrow money from the same source, which is surely a discovery worthy of this "the wonderful century." A man who can pay "a dollar down" can make himself the equal of the richest in all his belongings, from furniture to a diamond ring on his finger.

The question why a man who cannot pay for them buys diamonds resolves itself on examination into the larger and equally difficult question why a man who *can* pay for them buys diamonds. Now the diamond is distinguished among minerals by two properties; it has the greatest hardness and the greatest index of refraction. The first of these qualities makes it useful for cutting glass,

for drilling through rocks and for polishing hard gems, but since black and opaque diamonds are equally good for such purposes the price of diamonds for use is not high. It is the power of the diamond to bend a ray of light out of its course and to separate it into its constituent colors of the rainbow which gives the diamond its beauty. Other stones have a single color, or, like the opal, are beautiful only at near view. The diamond is the equal of them all and delights at a distance. People wear diamonds for the unselfish purpose of giving pleasure to others, as is obvious from the fact that they are usually worn on the head or neck, where they are invisible to the wearer. Women, as we should expect from the fact that they are so altruistic, wear them more than men.

Diamonds, however, are not worn for their beauty, great as that is. We know this because it happens that there are certain artificial silicates of the heavy metals, known as "paste diamonds," which have a refractive power so nearly equal to that of the diamond as to be indistinguishable from it. Only an expert can tell the difference, and he only after a close examination or chemical tests; so from the standpoint of beauty—that is, of value as a jewel, the silicate gems are equal to the carbon gems.

Why, then, since they are several hundred or thousand times more expensive and no more beautiful, do people buy diamonds instead of paste? Evidently the only reason is because they are more expensive. Their high price is due neither to their usefulness nor their beauty, but to the fact that they are hard to get. Their value is that of greenbacks; they are worth little in themselves, but cost a great deal. They are symbols of money, just as the flag or the iron cross is symbolic of patriotism or courage. A person who wears diamonds wears them purely for the display of wealth. They represent so much work; they are crystallized drops of sweat.

"What plant we in the apple tree?" Bryant told us in his song. We recommend some poet to write a companion piece on "What buy we in the diamond?" Perhaps Kipling, who has a monopoly of South African verse, would handle the theme best. It is a picturesque

topic. For every carat your diamond weighs, a naked negro, imprisoned in barbed wire and watched by the eye of the electric arc, has blasted out a thousand pounds of blue earth, and brought it to the surface and washed and sorted it. When we buy a diamond we invest in a share of Kaffir peonage, in a Jameison raid and a Boer War. We raise an "empire builder" and cast down a "lion slayer." We assist in the extension of the British Empire, geographically, in South Africa and intellectually by sending some worthy young American to Oxford. We cause the pulses of thousands of investors in stock companies to throb with the rise and fall of the London quotations. We find a poor boy named Isaacs in an East End old clothes shop, give him several hundred million dollars more than any man ought to be allowed to have, set him at fantastic capers in fashionable society under the alias of Barney Barnato, until he goes mad and escapes us by jumping overboard into the sea. The owner of a diamond ring has set his genii at more strange work than Aladdin with the slaves of his ring.

If the diamond really represented all its price in human labor it would then have a curious interest, such as makes us value a piece of lacquer, polished by years of hand rubbing, or a war ship carved in ivory and fitted into a nutshell. But considered merely from the standpoint of what it cost to get it, the price of a diamond is fictitious. If the diamond companies did not carefully regulate the number allowed to come on the market each year, diamonds would go out of fashion. Since the value of a diamond is merely its expensiveness, cheapening diamonds would make them valueless. In 1887 the De Beers Company obtained from their "acres of diamonds"—to be exact, $111\frac{1}{2}$ acres—over \$20,000,000 worth of diamonds; enough to have ruined the market forever if they had not been held up. Certainly \$20,000,000 worth of work was not expended in this case. Last week it was announced that the De Beers Company would raise the price of diamonds ten per cent. This is the third advance since February, and another is foretold soon. How convenient it would be if dealers in wheat or

steel rails would tell us beforehand just how much they were going to raise the price. Diamonds, like wildcat stock, have so little intrinsic value that they are subject to any desired manipulation.

But we can go still farther. Diamonds are no longer of value even as evidences of wealth, since as we are assured by the papers any one can buy them "on easy payments." Wearing a diamond ring, then, does not mean that you are rich, or even that you ever had a hundred dollars in your possession at any one time. It means only that you have a salary of some two dollars a month above your board bill, assuming that you pay that. To quote from one of the attractive advertisements: "You may have all the pleasure and prestige of wearing a beautiful Diamond a whole year for less than ten cents a week." But a paste diamond at the rate of a cent a week would give just as much "beauty," and also "prestige," if you kept still about it.

Not many years ago Moissan packed sugar charcoal in a gas pipe, heated it white, plunged it into water and dissolved it in nitric acid and found he had made diamonds. They were microscopic, it is true, but their form indicated that they were fragments of larger crystals which had been formed, but which had broken to pieces in the attempt to do in a few minutes what Nature takes her time to. There is no reason to think that it is impossible to make diamonds of any desired size, and we may expect to hear at any time that some inventor has accomplished this. Note the paradox. A scientific invention such as this would be supposed to enrich the world, but in this case the mere announcement of such a discovery would make the world some \$500,000,000 poorer—in its own estimation. In order to prevent the destruction of this enormous amount of property let us get out a perpetual injunction against the manufacturing of diamonds. It would not be the legitimate fall in price, such as results from a cheaper mode of production of some article of intrinsic value, but the sudden and complete collapse which follows the pricking of a Mississippi bubble, swollen by the breath of the promoter and reflecting on its filmy surface his iridescent visions. But with this difference. The investor in unsub-

stantial stocks has lost his hopes of future profits; the owner of the diamond which proves to be paste, or which can be made artificially, has lost nothing except in his imagination, for if the red and blue flashes were worth \$500 to him once, they are just as brilliant as ever, for a thing of beauty is a joy forever, not dependent upon the market price.

The nice thing about such a possible collapse in values is that no sensible man would lose a cent, because no sensible man buys anything because it costs a great deal; in fact, if he is very sensible he may buy a thing because it is cheap, if he wants it very badly.

A Musical Invasion

MORE and more America is becoming the Mecca of musical foreigners. This season they are coming over in such shoals that one can fitly speak of an invasion. From Germany, Austria, France, Italy, Russia, England, they come with their pianos, voices, violins and bâtons, all expecting to earn here from three to five times as much as they would in Europe. The best of them succeed in this lofty ambition, for Americans want the best, and are willing to pay for it; but wo to those who are not adjudged first-rate here; it would have been infinitely better for them had they remained on the other side of the ocean. It is these who spread the report all over Europe that we are not really musical. As a nation, we certainly are not as musical as the Germans, but, on the other hand, can we be blamed for paying little attention to second-rate singers and players when the first-rate are constantly visiting us? The very fact that we always hear the greatest artists in the world, because we are able to pay for them, has made us more critical and fastidious than most Europeans are, and enables us to reject as mediocre some artists who have achieved success abroad.

American competition affects the music-lovers of Europe as much as the merchants and manufacturers. Take the case of the prima donnas, for instance, With Patti, Sembrich, Melba, Calvé, Ternina, Nordica, Schumann-Heink in our concert halls and opera houses, where in all Europe could you find a septet to match them? Mme. Patti's "farewell"

tour is likely to prove really her last, and it is probable that those who are eager to see and hear once—or once more—the singer who has commanded higher terms than any other artist except Paderewski, will prove sufficiently numerous to make it remunerative. Mme. Patti's voice certainly was the most beautiful and spontaneous that ever came from woman's throat, and it will be of interest to see whether it remains so. She has dangerous rivals in Mme. Melba, who also will be heard in the concert hall only, and in Mme. Sembrich, who is a member of Mr. Conried's Metropolitan Opera Company. Of the four dramatic singers just mentioned, Mmes. Calvé and Ternina will belong to the same company, while Mme. Nordica will be heard in the concert hall only, which she finds even more profitable than the opera, while Mme. Schumann-Heink is to be heard both in concerts and in an opera company of her own. Another former member of Mr. Maurice Grau's opera company, Fritz Scheff, also has her own company.

Mr. Conried's Metropolitan program embraces the usual operatic favorites, to be sung, as heretofore, each in its original language, except that one of the novelties, "The Bartered Bride," by the Bohemian Smetana, is to be done in English. The other novelty, "Parsifal," is one which has caused more comment in Europe even than in America. The originally produced as long ago as 1882, it has never been performed in public except at Bayreuth. Managers have offered fabulous sums for it, but Mme. Wagner preferred to keep it as the chief attraction at the Bayreuth festivals. In most European countries the law of international copyright protects her, but not in America, where there is no more ground for not giving "Parsifal" than for not giving any of the other Wagner operas. There is every reason to believe that if Wagner had lived he would long ago have given this opera to the world at large, as he did his four Nibelung operas, which also he had originally intended to keep for Bayreuth alone. There it is accessible only to wealthy tourists, and Wagner was the last man in the world to write for wealthy tourists alone. He was a democrat, while his widow is an aristocrat, by birth as well as in sentiment, her mother having been a French

countess. It would have caused Wagner positive distress if he could have foreseen that before the end of the nineteenth century Bayreuth was to be a fashionable fad of the European aristocracy.

As for the religious aspect of the question, that need not trouble any one. "Parsifal" is not a sacred work, but a modern opera on a medieval subject. Its ethical spirit is Buddhistic rather than Christian, and if Wagner did retain a few suggestions of his early drama, "Jesus of Nazareth," they are entirely metamorphosed in the medieval legendary story. If it be asked why "Parsifal" has not heretofore been produced in America, the answer is, chiefly because we have had no theater in which it could be properly staged. Mr. Conried has had to rebuild entirely the Metropolitan stage to make possible a correct presentation of the scenic side not only of "Parsifal," but of all of Wagner's operas. He has bought new scenery for all of them, and for the first time the important and extremely impressive pictorial side of these operas will be properly presented in such of our cities as will be visited by the Conried Opera Company.

While the operatic circuit includes only half a dozen of our largest cities, the concert singers and players, more numerous than ever before, will dispense the blessings of the divine art throughout the whole country. The Boston, Chicago, Cincinnati, Pittsburg and Philadelphia orchestras will also provide entertainment not only for their own towns, but for many others. As for the metropolis, it will be positively deluged with concerts, especially of the orchestral variety. There will be Philharmonic, Symphony Society, Wetzler, Franko, Russian, Women's, People's, Young People's and Sunday concerts, and it is to be hoped they may all find their patrons. Of sensational interest is the action of the Philharmonic in importing half a dozen eminent conductors from Germany, England, France and Russia, an enterprise second in importance only to the first production of "Parsifal." Heretofore American orchestras have been contented with one foreign conductor each, now they are beginning to import them by wholesale. Where will this end? Will any musicians of note be left in Europe a decade hence?

The Protestant Episcopal Encyclical

It is a Pan-American Episcopal conference which was held last week in Washington, the capital of Pan-America. All the bishops of the Protestant Episcopal and Anglican Churches of the United States, Canada, the West Indies and Mexico were included in the invitation, and all who could attended. Such a meeting is of no little importance, for its members represent one of the most important and influential Churches of the continent. Their declarations, in their encyclical, should attract attention.

We notice first the preliminary statement of their authority:

"Assured of our rights and responsibilities as a true and a living part of the holy Catholic Church, with unbroken succession and authority from our head through his first Apostles, we feel that our attitude should be that of clear and outspoken consciousness of our catholicity at once in the maintenance of the ancient creeds and in our possession of Apostolic order."

The claim of "unbroken succession and authority" and the "possession of Apostolic order" is thus put in the forefront, as the basis of their right to teach and direct the Church. That is of value to those that value it, but the divine Providence which has in this generation made them the leaders of their hosts is an even better basis of authority than any assertion of unbroken succession, which was a few years ago denied by the highest court of the largest and perhaps the oldest Church in Christendom. It is better for the Episcopal Church to pipe low on questionable, or at least questioned, claims, and rest on those fruits of the Spirit in which it can more surely rejoice.

We are glad to see that this conference of bishops distinctly claims the right to carry on missionary work in Papal countries. That is, it will send missionaries who will reject the authority of local bishops whose unbroken succession is never questioned. Referring to Mexico, Cuba, Porto Rico and the Philippines, where are "churches subject to the Roman obedience," they say that the right of their Church to enter there "rests partly in the necessity of ministering to its own people"—that is, to American residents there—and partly on "the duty to give the privileges of the Church

to Christian people deprived of them, unless they submit to unlawful terms of communion." This must mean submission to the authority of the Pope at Rome as the Archbishop of Christendom. Certainly the exercise by the Roman Catholics or by any other denomination of Christians of a claim to exclude other Christians, who differ from them, from the privileges of the Church is abundant reason why those that differ, being yet Christians in belief, should claim and exercise the right to exist and to propagate their beliefs. The Church which excludes is itself the parent of the schisms which follow. And this has a wider application than simply to the Roman Church. The American Anglican Church herein takes the position, much attacked at the time, taken by the Anglican Church in Ireland when it consecrated a bishop to serve in Spain.

Next, this conference of bishops urges that young people be taught what are the points of difference with the Roman Church, and that, in case of marriage with a Roman Catholic, they refuse to make the required promise that their children shall be brought up in the Roman faith. It would be wrong for the Roman Church not to insist on the promise, or for the Episcopal Church to give it.

Still more important than the attitude of the Episcopal Church toward the Roman Catholic Church is its attitude toward its sister Protestant Churches with which it is in closer contact. Here the bishops lament "the manifest evils of that unhappy condition of disunion within the Church of Christ with which we are everywhere confronted to-day." To relieve this unfortunate condition is the desire of the bishops, and they suggest that the Episcopal General Conventions of the United States, Canada and the West Indies call the attention especially of the Presbyterian and Methodist bodies to the points of agreement and difference, "with a view of arriving at intercommunion and possible union of them and us," it being possible, perhaps, to compose some of the differences, and to recognize that others are not of essential importance.

This is most agreeable reading, and yet we ask anxiously whether it means anything more than the futile propositions of the Lambeth Quadrilateral. Those

propositions and the subsequent negotiations failed because the Episcopal Church was unwilling to allow intercommunion and mutual recognition of clergy unless the Presbyterians and others would consent to accept ordination by their bishops. At present Presbyterians, Methodists, etc., are glad to fellowship Episcopal clergy, while the Episcopal Church refuses corresponding recognition; and hence the schism, for which always those are responsible who refuse fellowship. If the Episcopal Church is willing to offer fellowship without surrender, then we may hope for some more happy result than followed the negotiations with the Presbyterians a few years ago. Each must be ready to fellowship the other as they are, for mutual tolerance is the only possible way to unite. Differences, however large, must be allowed. Those who value and claim unbroken succession and those who make no claim and have no care for it must find equal welcome. While this is the only question of difference, it does not look hopeful for a happy conclusion that this Episcopal encyclical should put the claim in the forefront of their document. It begins with the assertion of that, as the basis of their right and authority, which they deny is possessed by those whose fellowship they desire.

It was a happy result of discussion among the bishops that they made no pronouncement on divorce. Probably a majority of them would have favored a condemnation of all remarriages, even of an innocent party; but, altho a resolution to that effect was presented, wiser counsels prevailed, and no vote was taken. On this matter we shall probably have to trust the sound sense of the laymen of the Church.

The conference ended in a curious way, with a sermon to the assembled bishops last Sunday by a layman of the Dutch Reformed Church. President Roosevelt's text was, "Wise as serpents and harmless as doves," and a good sermon it was. It is a pity that the Protestant Episcopal Church and the Reformed Church are schismatically separated. But this separation is not spiritually serious. This is an illustration of the slight importance of ecclesiastical differences compared with those of the spirit. The time cometh, it almost now is, when neither

in Lambeth Palace nor in the Collegiate Church of New York, but solely in spirit as in truth shall men seek to worship the Father.

Booker T. Washington

IT had not seemed possible that the time would come when Booker T. Washington would need defense, but it is here. A few weeks ago he was roundly hissed in a negro meeting in Boston, which was nearly broken up by his noisy enemies. He is receiving the sharpest criticism from some of the ablest colored men in the country; while in the South several incidents have turned from him the prevailing sympathy among the white people. One of these was his accepting an invitation to remain to luncheon with President Roosevelt, and another was his taking possession, with thirty or forty other colored men, of the main dining room at a North Carolina railroad station, while the white travelers in the train were sent to an improvised table elsewhere. He was sharply attacked in the Alabama legislature the other day when the question was up of appropriations for education. His luncheon with President Roosevelt has been made the excuse for even more bitter attack on President Roosevelt than on Dr. Washington, and already enters into the next Presidential contest in the form of a campaign button meant to satirize the upholder of "Equality."

Copyrighted by C. H. Thomas and P. H. Lacy,
6327 South Sangamon street, Chicago, Ill.

With the complaints that he is accepting social recognition or crowding white people we have no sympathy, and very little with the criticisms made by colored men that he is playing into the hands of the white South by his devotion to in-

dustrial education. We cannot see but that he has pursued a dignified and honorable course, even if he has not emphasized, and possibly has not seen, all the truth.

Among his negro critics we may mention two men of character, Professor Du Bois and Bishop Turner, the former in his remarkable book, "The Souls of Black Folks," whose eloquence we admire, and with whose positions we are in general agreement; the other in the missionary journal which the Bishop edits. They agree that Dr. Washington magnifies that industrial education which is all that Southern white people generally want to give the negro, that he disparages the higher education, that he tells his people to let politics alone and be satisfied not to vote, and that the disfranchisement of the negro in the South is in good part the result of his teachings. Says Bishop Turner:

"The education of the negro must not be limited. . . . A race, the acme of whose ambition is to become blacksmiths, shoemakers, farmers, wheelwrights and the like, will be forgotten before it is dead. . . . No leadership is so false and no doctrine so harmful as that which denies the opportunity to a struggling people to rise and aspire to the highest, the purest and the most useful in society."

What the Senior Bishop of the African Methodist Church says is true, but we do not believe that it condemns Dr. Washington. We do not believe that he forbids the highest aspiration. He believes in a lower and industrial education for the mass of the people, and in the higher education for the hundredth boy or girl who has the ambition and the ability to get it. But his work is with the ninety-nine, and that is what he must emphasize. He does not disparage Atlanta or Fisk University when he magnifies Tuskegee. He takes his teachers from these institutions. It does not follow because a man endows Drexel, or Armour Institute, that he has no use for Harvard or Yale. The man who founded Pratt Institute in Brooklyn sent all his boys to Amherst College. A man doing a work must magnify it. That is the condition of success.

Nor do we believe that Dr. Washington's views as to the policy of political

aspiration by negroes have had more than the slightest influence in controlling Southern action. He is not responsible for the exclusion of the negroes from the ballot. Nobody thought of him when the Democratic convention in Maryland the other day declared that this must be a white man's Government. It is true that while Dr. Washington has been preaching industrial education there has grown up this hostility to negro suffrage, but his influence here has been nil.

If Dr. Washington has been in fault at all it has been chiefly for his prudent reticence. He has encouraged the negroes to lie low till the storm be overpast. We should give the opposite advice. We should urge every negro to vote that can get his name on the registry. They should never yield the principle or the practice. But this is a matter of good judgment as to policy, and we do not doubt Dr. Washington's sincerity of purpose to do all he can for his people, while we recognize the limitations of one who must depend in part on the State of Alabama for the support, or, indeed, the sufferance of his Institute.

The Mohonk Conference

It looks as if we were approaching the final stage in the settlement of our duties to the Indians when the Mohonk Indian Conference finds it necessary to do nothing more than to reiterate what it has said in previous years. A few years ago the policy of separate allotments of land for Indians was strongly urged, and it has since been pursued by the Government; now not a word is said on the subject in the platform, except as to the New York Indians, which is evidence that the work is going on quite as fast as is desirable; and, indeed, there is danger that while the Indians have the right to lease their holdings the allotment system may work serious evil. What the Conference particularly reaffirms, with great wisdom, is the speedy abandonment of the reservation system, the substitution of bonded superintendents for Indian agents, and the education of Indian children in the public schools at Federal expense, wherever practicable. This last proposition means the giving up, within a reasonable time, of the large and expensive Indian boarding schools, and to that we are coming.

We agree with the Conference's expression of satisfaction with the general management of the Indian Bureau under Commissioner Jones. He is a faithful officer who has the interests of the Indians at heart, and will not consciously sacrifice them to those of white speculators.

Uniform Divorce Laws

We have been at work these twenty years trying to secure uniform legislation in the States on the subject of divorce, and have as yet made but little progress. There are said to be 46 sets of laws, no two alike. People are moving from one State to another just to get divorces. A man may remain married in one State and at the same time be divorced in another State. They are, in this respect, like foreign countries to each other. It is not strange that the movement gathers strength to have the United States Constitution amended so as to put the legislation on marriage and divorce under the control of Congress. Doubtless this will be done if the States do not make better speed in the work of securing uniform legislation. It would require the addition of just two words to the Constitution, so that a clause in Section 8 shall read: "Congress shall have power to establish a uniform rule of naturalization and uniform laws on the subject of bankruptcies *and divorce* throughout the United States." Yet it is a slow and difficult task to amend the national Constitution. There was much talk of such an amendment when the question of Mormon polygamy was prominent; but the "revelation" which forbade further polygamous marriages and the pledge and legislation of Utah on its admission as a State removed the most glaring offense and occasion for the proposed amendment. It is not desirable to centralize power and put burdens on Congress further than is absolutely necessary. We have not yet quite exhausted the force of public opinion within the States. An organization in support of uniform legislation on divorce is still at work and makes annual reports and finds some encouragement. But somehow it is easier to get uniform legislation on almost any other subject, and it

may become necessary to press for the proposed Constitutional Amendment. There is said to be one family of distinction, or at least of wealth, well known in our summer capital, of which every member had been divorced except one, and in the event of her approaching marriage the amount of alimony in case of possible divorce was commonly discussed.

President Harper, of the University of Chicago, is nothing if not radical. His latest scheme is said to be to abolish gate receipts at all intercollegiate athletic contests and to supply the money needed for the teams by endowment. The feeling has become pretty general among those interested in academic affairs that the amount of money taken in at the gates and turned over to the athletic teams to be recklessly squandered has grown out of all bounds. There is even something offensive to many people in the spectacle of a college eleven playing before crowds of people who pay for their seats as they would to see a professional match. If President Harper can carry through his scheme—and the raising of a few hundred thousands or even a few millions never seems to worry that eminent gentleman—he will be taking a step in the right direction, tho there may be other methods of putting an end to the grossest of the evils now attending college athletics.

We knew that despite his inability to control the clique that rules him and rules Russia, the Czar wishes to be a philanthropist, but we did not suspect him of being a poet. Yet the lines signed "Olaf," printed in a Russian magazine, are credited to him, and they show a deep dissatisfaction with the conditions that hedge him about, if we may judge from the fragment of it translated into smooth English verse:

"My happiness was born at night,
And suckled in the gloom;
My pleasures have dissolved in flight,
Heart stricken at my doom.
"My soul strives blindly for relief,
Chilled as by drifting snow,
By doubts which scoff at the belief
Of finding peace below."

If Emperor William can preach sermons, why should not Czar Nicholas write poetry?

We have thought it only fair to let Archbishop Aglipay speak for himself. We do not vouch for him as the model prelate of peaceful and pious times, and we presume he will have a hard time to build up his Church, and much harder now that American bishops are in the Philippines, and especially as the Catholic Church in those islands employs an able firm of American lawyers, it is said at a large expense, to protect its rights against him and in defense of its claim to ecclesiastical property. The treatment which the friars in charge have given the native priests is responsible for the success of Aglipay's rebellion.

Ever since the rise of the Morgan trotters, and especially since Lady Suffolk made what was her sensational record of a mile in two minutes and twenty-six seconds, now fifty-four years ago, there has been a persistent attempt by breeders to produce a horse that would trot its mile in lessening figures, and for years the question was whether the two-minute limit would ever be reached. At last it was passed by Cresceus in 1:59¾, and last week the wonderful mare, Lou Dillon, trotted the mile in 1:58½. It is a triumph in evolution as well as in speed.

Too much must not be made of the first hot words of Canadian statesmen in comment on the decision of the Alaska Commission. Their first temptation was to charge that Great Britain had sacrificed Canadian interests to the good will of the United States. But this is too foolish to be really believed. That the decision is just will come to be accepted, and it will be no more difficult to accommodate conditions to it than it has been for a generation. Canada will not love the mother country any less now that she has reason to honor her sense of justice.

This is the picturesque way in which that vernacular philosopher, Devery, treats of the labor question:

"Don't vote for strikes. I've played checkers with the labor question for a year, and I say that you don't want strikes all the time. Take more money home, have more in your pocket and make both ends and the middle meet."

Insurance

Hail Insurance

IN some of the Western States the menace to crops from hail is very great. Every farmer in Minnesota and its bordering States is exposed to this hazard, and must, of course, know that through the agency of hail his season's work in whole or in part may thus be destroyed. The risk is ever present, and remains until his crops are harvested. There is not a farmer in the section who can be sure that his growing corn, grain and other crops, no matter how thrifty they may be when he goes to sleep at night, may not be beaten down and destroyed by hail before morning. It is doubtless true under the circumstances, therefore, that the great majority of farmers would be quick to insure their crops, if they had confidence in the insuring company, and if the premium were not prohibitive. Hail insurance might well be placed upon the same basis as fire insurance, in so far as the requirements for the organization and operation of the insuring company are concerned. It may pertinently be asked why should not companies be organized with especial reference to covering risks signified by hail insurance, the range of whose operations should not necessarily be limited to one State, but might extend over the whole field where the farmers generally are subject to this risk?

State Supervision of Insurance

IN an address delivered before the thirty-fourth annual meeting of the Fire Underwriters' Association of the Northwest, recently held at Chicago, President John H. Washburn, of the Home Insurance Company, sharply criticised the abuses that have crept into State supervision as too often practiced at the present time. Some of the methods now prevailing, according to Mr. Washburn's speech, constitute very serious problems with which his company and other companies are obliged to deal. Continuing, he pointed out that if company officials generally would take a determined stand

upon State supervision and combat irregularities therein many evils which now exist might easily be overcome and removed. When State supervision was inaugurated some fifty years ago it was with the best of intentions. With introduction of politics into the appointments of insurance commissioners, however, many unnecessary burdens were under such conditions added to perfectly solvent and honest corporations with absolutely no gain to the community. State supervision itself is good and necessary for the protection of the people, but to the abuses of the system Mr. Washburn is unalterably and rightfully opposed.

Insurance Course at the Boston University

THE Boston University has just established an insurance course in its school of medicine. It will bear the title of "Life Insurance and Its Relations to Medicine." The plan is to embrace a general survey of alcohol, suicide, etc., as factors in life insurance. It is claimed that this is the first undertaking of the kind in the country. Frank E. Allard, M.D., who has had twelve years' experience in the medical branch of life insurance, will have charge of the Boston University course.

THE *Weekly Underwriter* utters a lament in its current issue because of the manifest impossibility of securing the services of John Alexander Dowie as an agency superintendent by a hustling life insurance company. He would, the editor thinks, conduct a canvassing campaign that would throw competition into a deep shadow. Under his system his messengers visit every house in a locality, Chinatown not excepted, with canvassing literature—"Leaves of Healing"—he calls them—and carry the simple blessing, "Peace to you," upon their lips. If such energetic methods could be applied in spreading the gospel of life insurance, the results would doubtless be most astonishing in their productiveness.

Financial

The Bankers' Convention

AT last week's interesting annual convention of the American Bankers' Association in San Francisco, a report was submitted by the Special Currency Committee appointed a year ago at the New Orleans meeting. The members of this committee are Charles S. Fairchild, H. C. Fahnestock, Myron T. Herrick, Homer S. King, George Q. Whitney and J. J. Mitchell. Pointing out that there is now in the country more real money than ever before (the circulation being \$29.60 per capita), and enough to meet any legitimate demands of business, the committee urged that the money received by the Government for customs duties should be deposited in the banks, as the internal revenue receipts may be, and thus be made available for use in general business. The Secretary of the Treasury, it was suggested, might be authorized to deposit the customs money to the extent of 50 per cent. of a national bank's capital and surplus, upon a guaranty of securities acceptable to him. The committee held that the present limitation of \$3,000,000 per month upon the withdrawal of bank circulation should immediately be repealed, in order that expansion and contraction might be automatic and governed by prevailing conditions. (Mr. Whitney dissented from this recommendation, but agreed with his associates as to the remainder of the report.) With respect to emergency circulation, the committee was of the opinion that it could safely be permitted upon the actual deposit with the Treasury Department of securities acceptable to the Secretary. Such circulation should be subject to a tax of 6 per cent. per annum, and this tax should be set aside as a safety fund to secure the Treasury for the redemption of the notes so issued. Beyond these conservative recommendations the committee would not go. The report was adopted, and a committee will be appointed to promote legislation in accordance with it. By a nearly unanimous vote the gold standard resolutions proposed last year were approved. These call for a discontinuance of the monthly coinage of silver dollars, the maintenance

of those outstanding on a parity with gold, and the recoinage of them into subsidiary coin to meet the public needs.

The convention adopted the proposed plan for a general bank money order system. All banks in the association are to be placed in a money order league, and they will compete for business with the express companies and the Post Office Department. It is expected that the orders thus issued can readily be cashed at any bank in the country and eventually at banks in other parts of the world. The magnitude of the business of which the banks intend to obtain a large share was shown by reference to the money order transactions of the Post Office Department, amounting to \$1,200,000 a day, and to an annual total exceeding \$120,000,000 for the express companies. Among the best addresses was that of Comptroller Ridgeley, who said that our prosperity rested on a solid foundation and was due to legitimate causes and forces, all of which were still in operation. We had gone too fast in speculation and promotion, but the resulting reaction would have been a cyclone of ruin and disaster if the country had not had absolute confidence in the soundness of the currency. What we needed now was not legislation, but business sense and good judgment; and much would depend upon the wisdom and conservatism of the bankers.

ALVIN W. KRECH, President of the Equitable Trust Company of New York, has been elected a director of the Lawyers' Mortgage Company.

....Secretary Shaw's offer of a loan of \$500,000 to each of six national banks in St. Louis has been accepted. The loan is designed to assist the banks in moving the crops and in financing enterprises connected with the World's Fair. It will be protected by \$4,000,000 in such securities as are accepted by Eastern savings banks.

....Dividends announced:

Atch., Top. & Santa Fe R R., Common, \$2.00 per share, payable December 1st.

Southern Pac. Co., various coupons, payable November 1st.

Amer. Exchange Nat'l Bank, 4 per cent, payable November 2d.

No 2866

Survey of the World

Politics and National Topics

It is now well understood that Senator Hanna will resign the chairmanship of the Republican National Committee before the beginning of next year's campaign, owing to the condition of his health. The President, it is said, would like to see the place filled by the election of Ex-Governor Crane, of Massachusetts, if he cannot induce Mr. Hanna to retain it. All reports agree in saying that Secretary Perry S. Heath must go, with very little delay, owing not only to the Tulloch charges (concerning his action while holding the office of First Assistant Postmaster-General), but also to the statements of Mr. Bristow's report upon the same subject. In some of the dispatches from Washington the prediction is made that Mr. Heath will be indicted; in others it is said that legal proceedings against him are barred by the statute of limitations.—A decision of the Supreme Court extends the admiralty jurisdiction of the Federal courts to canals and canal boats. On this question the court stands five to four, the minority being composed of Chief Justice Fuller and Justices Brewer, Harlan and Peckham. The case (*Perry vs. Haines*) arose over a bill for repairing a canal boat used on the Erie Canal. An attempt was made to enforce the contract lien law of the State of New York. Enforcement was resisted on the ground that the contract was a maritime one and therefore exempt, and that the Federal courts alone had jurisdiction over such cases. Justice Brown, in the prevailing opinion, holds that canal boats are ships within the meaning of the admiralty laws, and that for this reason the case is one in which only the National courts have jurisdiction. "Neither size, form,

equipment nor means of propulsion are determinative factors upon the question of jurisdiction, which regards only the purposes for which the craft was constructed and the business in which it is engaged." In his dissenting opinion Justice Brewer remarked that it seemed an anomaly that when a State builds a canal, owns it and has general control over the waterway, it cannot provide as it sees fit for enforcing claims for work on vessels navigating the canal, when the vessels are of such a character as prevents the use of them in any foreign commerce.—A decision of the Navy Department recalls the old controversy in Congress about the contracts for armor plate. Bids were recently received from the Carnegie Steel Company and the Bethlehem Steel Company, to which the contracts have heretofore been given, and also from the Midvale Steel Company, whose bid was much the lowest. The award is to all of the three bidders, there being practically an even distribution of the 17,000 tons required for five battleships. The Department was unwilling to rely exclusively upon the lowest bidder, because the Midvale Company has no armor plant, and its ability to produce, by a new process, plates equal to those hardened by the Harvey or the Krupp process is yet to be tested. The company will spend \$2,000,000 upon an armor plant.—Rear-Admiral Francis T. Bowles, Chief Constructor of the Navy, has resigned his commission to become President of the Fore River Shipbuilding Company, of Quincy, Mass., which is now constructing two battleships and a cruiser for the Department. His resignation was accepted with expressions of regret. It was at first reported in some quarters that his

retirement was due in part to recent testimony, in the inquiry concerning the collapse of the United States Shipbuilding Company, that for appraising the plants combined in that company he received \$10,000 in cash, \$15,000 in bonds and \$50,000 in stock. While he was employed, however, with the consent of Secretary Long, to make the appraisal, he has received no pay, having refused to buy stock or to take securities that were set aside for him.—General Gillespie, Chief of Engineers, in his annual report, says that the time has come when it is no longer possible to ignore the question of insular defenses. There should be a tribunal, similar to the Endicott board, he adds, to decide as to the defenses of the most important harbors of the Philippines, Guam and Hawaii.—At Indianapolis, on the 31st ult., James Lynchehaun was released from custody upon the decision of United States Commissioner Moores that the offense for which he had been imprisoned in England was a political one. Lynchehaun was convicted of assault, with intent to kill, upon Mrs. McDonnell, whose tenant he was, in Ireland. He escaped from prison, was traced to Indianapolis and was arrested there and held for extradition. It was admitted that an attempt to drive this land owner from the country was made by burning her buildings and by a riot, in the course of which she was attacked. The Commissioner held that the assault was incidental to a popular disturbance, which had its origin in a movement to overthrow landlordism; that the riot (of which the assault upon Mrs. McDonnell was a part) was for political purposes, and that the prisoner's offense was one for which, under the treaty, he could not be surrendered to the British Government.—Last Saturday night marked the close of the political campaign, which has been quite exciting in several States, especially in Ohio, where Mr. Hanna is a candidate for reelection to the Senate, and in Maryland, where Mr. Gorman, leading the Democrats, gave great prominence to the race issue. In the city of New York, where Tammany was striving to prevent the reelection of Mayor Low, the experimental canvasses made by newspapers pointed to a close vote, one journal giving Mayor

Low a majority of 13,000 (in a total registration of 615,000), and another saying that its inquiry indicated a majority of not more than 10,000 either way.

The Panama Canal

Yielding to a demand from the House, the Colombian Senate consented to a final adjournment on Saturday last. Some days earlier the committee appointed by the Senate to examine various propositions relating to the canal made an adverse report not only upon the bill, declaring the extension of the French company's concession to be invalid, but also upon the resolution demanding \$20,000,000 (instead of \$10,000,000) from the United States and \$10,000,000 from the company. At last accounts a majority of the Senate appeared to desire an indefinite postponement of the whole matter. The very meager news dispatches from Bogota do not show that any action was taken. Conflicting statements are made concerning the danger of a revolt on the isthmus. Friday afternoon's dispatches from Bogota said that official news from all the provinces reported complete tranquillity everywhere. On Friday evening, however, the War Minister read to the House his latest advices from Panama, and the House by a unanimous vote of confidence "indorsed the energetic measures taken to meet the situation there." Six thousand men are soon to be sent to the isthmus, and it is said that Governor Obaldia will be superseded by the War Minister himself. The Bogota Government appears to be preparing for an uprising in Panama, altho no signs of one have thus far been reported.

Postal and Land Frauds

The Post Office Department has undertaken to make a searching investigation of the Post Office in New York, and six inspectors have been assigned to the work. Recent inquiry as to the offences of Machen, Beavers, and others suggested the need of such an investigation. The work will be done under the direction of Fourth Assistant Bristow.—There has been published the following extract from a letter sent by President

Roosevelt, during his Western trip, last spring, to Postmaster-General Payne:

"There has evidently been some very bad work in the past in the Post Office Department, and we cannot afford to take half measures. We need some new men, and very possibly a rearrangement of positions. Let Bristow go right on with his investigations, and, if there is the slightest rottenness, put the knife in up to the hilt. Bristow is an entirely fearless and honest man."

Testimony recently taken in San Francisco may be the basis of proceedings against Postmaster Montague, of that city. D. S. Richardson, Superintendent of the Post Office there, testified that, with the approval of Mr. Montague, president of a time indicator company, he gave to Machen and Beavers large blocks of the company's stock, thus procuring contracts for the company. Richardson produced a letter sent by him to Machen, in which he intimated that Congressman Loud had some knowledge of the transactions.—In connection with the land frauds seven persons have been indicted in Oregon—Asa B. Thompson, Receiver of the Land Office at La Grande; Mary L. Ware, formerly Land Commissioner at Eugene (removed some months ago on charges of fraud); Emma L. Watson, Horace G. McKinley, S. A. D. Porter, Guy Huff, and Norman Williams. These men were land speculators and they are charged with forgery or with conspiracy to defraud. Secretary Hitchcock says the frauds involve about 1,000,000 acres. He denies that he has evidence connecting several Senators with them. Additional indictments are expected.

The Public Health

At the annual meeting of the American Public Health Association the transmission of tuberculosis, the need of sanitary safeguards in railway cars, and the relation of mosquitoes to yellow fever infection were the subjects of interesting papers and much discussion. Dr. Salmon, of the Bureau of Animal Industry, asserted that clinical evidence, statistics and experiments warranted the conclusion that bovine tuberculosis was communicated to man through the agency of milk. Dr. Ravenel, of the Pennsylvania Live Stock Sanitary Board, read a paper in which he expressed similar opinions,

based upon his own researches and study, altho he held that the chief agent of infection was the dried sputum of consumptives. "The eradication of bovine tuberculosis," said he, "is amply justifiable from a purely economic standpoint; viewed in its bearing on human health, it becomes a public duty." The report of the Committee on Yellow Fever urged that the habits of the mosquito should be more closely studied. A long discussion disclosed remarkable unanimity of conviction that mosquitoes are the sole agents of infection. Several who had in past years strenuously opposed this explanation announced their acceptance of it. Among the experts who read papers on this topic were Colonel Gorgas and Drs. Guiteras, Finley and Lindsay, all of whom had taken part in the experiments in Cuba. The Committee on Car Sanitation criticised with much severity the lack of sanitary precautions on the railways, and especially in sleeping cars. The results of the committee's inquiries will probably cause a more frequent and effective cleaning and disinfection of bed clothing and berths. Leprosy, the committee remarked, was transmitted less easily than tuberculosis, and as a cause of death was comparatively of no account; but the admission of a leper to a railway car would cause a riot. The convention appeared to approve the committee's opinion that sleeping car blankets ought to be washed more frequently than once in six months. Owing to inadequate ventilation and for other reasons the committee held that sleeping cars were potent factors in the transmission of consumption and other infectious diseases. In his annual address the President, Surgeon-General Wyman, expressed the opinion that popular interest in sanitary reform might be enlisted through the agency of labor unions. These had already shown their own interest in sanitation, he said, and were nearer to the great voting public than any other organized bodies in the cities.

Our Islands in the Pacific

The Vatican expects that the problem of the friars and their lands will be solved in the near future, probably before the retirement of Governor Taft from

the office which he now holds. Our Government, it is understood, offers \$8,000,000 for the lands, and the friars have recently reduced their demand to \$12,000,000. It is reported from Rome that if we should divide the difference and offer \$10,000,000, this sum would be accepted. By the Vatican the Generals of the four orders have been instructed to say to their provincials that the money received for the property must not be taken from the islands, but must remain there for the benefit of the Church. If a settlement should be reached, the withdrawal of the members of the four orders would probably follow, because the four American Bishops would not employ them in the service of the Church if it should appear, as in all probability it would, that these friars were still regarded with hostility by the Filipinos.—There was published last week an interesting dispatch sent to the War Department on December 28th, 1900, from Manila by General McArthur, relating to alleged encouragement of the insurgents by Japanese authorities. This dispatch said that among the captured papers belonging to Trias, the insurgent commander, was one containing the Filipino account of a conference between Trias and the Japanese Consul in a remote part of Cavite Province on October 11th, 1900. General McArthur said:

"Paper carefully prepared, authenticated by Filipino Secretary, measurably confirmed by other captured papers, most probably true. I accept it as such without hesitation. Consul advised that Trias visit Japan to negotiate voluntary contribution of arms, and concerning future of archipelago. Filipinos represented that concessions which they might be forced to make to Washington would be more agreeable if made to Japan, which as a nation of kindred blood would not be likely to assert superiority. Consul said Japan desired coaling stations, freedom to trade, and to build railways."

He added that if there had been such official encouragement, it might account for the defiant attitude of many insurgent leaders, and especially the wavering policy of Trias. The Japanese Consul in charge at Manila was Taiyo Hojo. Minister Takahira, at Washington, expresses great surprise and says General McArthur must have been misled. It is ridiculous, he says, to suppose that Pre-

mier Yamagata, a warm friend of this country, could have sanctioned such treachery. Japan, he adds, had all the coaling stations she needed, was fully engaged in railway work at home and in Formosa, and was satisfied with respect to trade relations. He has asked his Government to make an investigation. It is said that persons connected with the Japanese legation regard the publication of the dispatch at this time as designed to show that Japan does not deserve the support or sympathy of the United States in her controversy with Russia.—Millerio, the ladrone leader in Rizal, has been sentenced to death. Two of his officers will go to prison for life.—Concerning the encouragement of railway construction in the Philippines, it is reported that Governor Taft and Secretary Root agree in holding that under present conditions land grants cannot be made, but that the Insular Government has power to grant rights of way and to guarantee interest on railroad bonds.—The President has appointed Sanford P. Dole (now Governor) to be United States District Judge for Hawaii, to succeed the late Judge Estee, and George R. Carter (now Secretary of Hawaii) to be Governor of the Territory.

Cuba and Porto Rico

Altho it is generally understood that the Isle of Pines is admitted to be Cuban territory, a suit to determine the question of sovereignty has been brought in the United States Circuit Court by a plaintiff representing the American residents of the island. In this suit the plaintiff seeks to recover from the Collector of the port of New York the value of 2000 cigars which were seized for tariff duties. He contends that duties ought not to be collected upon imports from the Isle of Pines.—The special taxes authorized to meet the expenses of the proposed loan of \$35,000,000 are opposed by the retail merchants of Havana, who have decided that they will not sell a majority of the articles upon which the taxes are imposed.—The new Catholic bishops appointed for the dioceses of Havana and Pinar del Rio were consecrated last week at the old cathedral in Havana. The Rev. Dr. Bonaventure Broderick, appointed Auxiliary Bishop of Havana,

was born in Hartford, Conn., 35 years ago, and was for a time the pastor of a small parish in that State. He studied for the priesthood at Rome. After the war with Spain he assisted Bishop Sbarretti in the negotiations with General Wood concerning the property of the Church in Cuba.—Governor Hunt, of Porto Rico, will resign within the coming three or four months and will be appointed Judge of the United States District Court in Montana, to succeed Judge Knowles, who is soon to retire on account of his age.

Santo Domingo A new revolution has started in Santo Domingo and, according to the meager dispatches sent to this country, it has almost succeeded, for President A. Wos Y Gil has only the capital city of San Domingo under his control. The insurgents justify the revolution on the ground that President Wos Y Gil is arbitrary, jealous and suspicious and has unjustly filled the prisons of the country with his political enemies, and has sent many more innocent persons into exile. They also claim that the revenues have been decreased within the last few months by a million dollars. Gen. Carlos Morales, who heads the revolution, has been Governor of Puerto Plata under the present government, having fought former President Vasquez to place Gen. Wos Y Gil in power. In fact, General Morales has rebelled against every government under which he has at various times served. He was formerly a priest, but left the Church for politics, and it is said that his ambition has long been to be President. He at present is styled Provisional President of Santo Domingo, in addition to his generalship of the insurgent forces, but it is expected that when San Domingo falls he will have to give way to Ex-President Jimines, who is now in Porto Rico, waiting to get back into power. President Wos Y Gil appointed Jimines his fiscal agent to the United States and Europe a year or two ago, with a salary of \$12,000 a year, but Jimines resigned this office in order to take part in this revolutionary movement. In view of the seriousness of the situation, the Navy Department has dispatched the "Balti-

more" to the scene of action to prevent any outrages upon American citizens; and altho the cable offices are in the hands of the insurgents, United States Minister Powell manages to keep the State Department fairly well informed in regard to the situation.

New British Rifle

Just two and a half years ago the British military authorities started a special Small Arms Committee to devise a new rifle for the army. Their aim was two-fold; to provide a better weapon than the old Lee-Enfield, which was used in the South African War, and to make this weapon such that it might be used in all branches of the army alike. The perfected weapon is at present being manufactured only at the Royal Small Arms Factory, where it has been perfected, but its manufacture will be taken up at one of the Birmingham private factories as soon as the committee can arrange to furnish the necessary gauges and tools. The caliber of the new rifle is the same as that of the Lee-Enfield—viz., 0.303 inch; it has five grooves, with a "spiral" of one in ten inches. The greater number of "misfires" during the war occurred because the striking-gear was clogged with sand or dirt; in the new rifle changes have been made such that this form of clogging is far less likely to happen. The magazine will contain eleven cartridges, and is loaded from a light steel slide which holds the cartridges in line by their flanged base. The action of the rifle is quicker than the old Lee-Enfield. The length is 3 ft. 8½ in., the same for all branches of the service, and the barrel is sheathed with wood from the breach to the fore-band, through which the muzzle just protrudes. It is thus possible to handle the weapon at any part safely, no matter how many rounds have been fired through it. Considerable improvements have been made in the sighting apparatus. The rifle is not provided with a wind-gauge, but the War Office has decided to adopt this aid to accurate shooting, and it will be added to the rifle when issued to the forces. Considerable criticism has been expressed against the shortness of the new small arms, and it has been said that for this reason they will not shoot as accu-

ately as the longer Lee-Enfield. The committee, however, avers that an elaborate series of tests shows that the new weapon is actually much more accurate than the old, that its muzzle velocity is slightly higher and that an increased "figure of merit" is obtainable with it.

Fire in the Vatican

A fire which broke out in the Vatican at half-past eight in the evening of November 1st threatened to destroy some of the chief treasures of the world, but was fortunately put out before this supreme damage occurred. The first intimation of danger was smoke issuing from one of the Vatican apartments. This apartment, situated above the famous Library, was occupied by M. Marle, who is engaged in copying and illuminating manuscripts to be exhibited at the St. Louis Exposition. It is supposed that M. Marle went to bed without covering his kitchen fire, and that this blazed up and caught some of the nearby hangings. When the news of the fire was carried to the Pope, he was found kneeling in his chapel engaged in prayer; he went immediately to the scene and assisted personally in trying to subdue the flames. Later, when the Fire Department arrived, he retired to his own apartment. The firemen of Rome were called by telegraph and came with four engines in about ten minutes, but were delayed some time in finding a sufficient water supply. Meanwhile, the flames had begun to break from the windows of M. Marle's apartment. A large crowd of persons gathered to the spot, and Rome was in a greater state of excitement than at any event since the death of the late Pope. The fire had one curious result; information of it being sent to the Italian authorities, they hurried to St. Peter's and were invited to enter. Among the authorities were the Mayor of Rome, the Prefect, police officials and Signor Ronchetti, the newly appointed Minister of Justice, who took charge of the men who were fighting the flames. This is the first time, since the fall of the temporal power of the Vatican and the so-called imprisonment of the Pope, that any Roman officer has entered the Vatican in his official capacity. A little after eleven o'clock the fire was got under control,

but smouldered on for some time afterward. At the time of this writing the exact loss caused by the flames and water is not known. The entire Museum of Inscriptions, the rooms of the Chief Librarian and parts of the Library and printing houses were flooded with water, but, apparently, none of the more famous treasures were injured.

German Finances

A conference of Representatives of the German Federated States is in session in Berlin to consider the financial status of the Empire. The first meeting was presided over by Count von Bülow, the Chancellor of the Empire, and this fact was held to indicate that the Government regards the relations of the Budgets of the separate German States to the Imperial finances to be in urgent need of readjustment. The Chancellor, after a complimentary speech, submitted for consideration various proposals for readjustment which had been drafted at his suggestion, and these proposals were later explained in detail by Baron von Stengel, who is the new Secretary of State for the Imperial Treasury, and who presides over the Conference when the Chancellor is not present. The main purpose of the Conference is to devise means for preventing further imposition of assessed contributions from the separate German States to the Imperial Treasury. All income taxes, and direct taxes generally, can be imposed only by the separate states, and from this income a certain assessment is paid into the Imperial coffer. Indirect taxation is imposed by the Imperial Government; and when the financial program was sketched by Bismarck, in 1879, he supposed that the revenue from customs and excise duties would be so large that out of their surplus sums might be paid back to the separate states which would more than cover their assessment. At the present time, however—that is, during the fiscal year from April 1st, 1903, to March 31st, 1904, the finances of the Empire are in such a state that a supplementary loan had to be allotted to balance the Estimates; and, also, it was found necessary to assess the separate German states for sums which amount to about \$6,000,000 over and beyond the contributions for

which they are indemnified out of the Imperial Treasury. The finances of Prussia are in such a condition that this burden is not really felt; but some of the smaller states are scarcely able to bear the demands put upon them. It is not likely that the measures proposed by the Conference will be carried into effect, since both the Radicals and the Clericals in the Reichstag will be opposed to them. Herr Richter describes the Government program as "a Bavarian financial policy," and regards Baron von Stengel as a mere puppet of the Bavarian Finance Minister. He does not regard the burden which falls on the German states as in any way excessive; especially is this true in regard to Bavaria, which enjoys certain marked privileges. Bavaria, for example, is not subject to the general Imperial excise duties on beer, but collects its own beer duties and pays to the Empire for this exemption a contribution of so much per head of its population. This contribution is based on the average consumption of beer by the individual German; but, as each Bavarian drinks, on an average, 245 liters of beer per annum, whereas other Germans drink only 145 liters per head, Bavaria really ought to pay 10,000,000 marks, instead of 4,287,000 marks, to the Empire for this subscription. The Clericals announce that they will resist any scheme which means that the burden of expenditure for the army and navy shall fall on the masses through indirect taxation, instead of being paid chiefly by the rich through the income tax.

French Affairs Two days after the opening of the French Parliament the Government won a decided victory in the first important debate of the session. Premier Combes demanded that the interpellations on the subject of the religious congregations be united with those on the general policy of the Government, whereupon the religious interpellations were withdrawn. He said, moreover, that the Government was prepared to continue the war against the congregations, as it was the war against slavery of the intelligence everywhere. The Government intended to repeal the Falloux law, thus completely putting an end to congregational edu-

cation. The opposition speakers, MM. Gauthier and Dansette, brought up the recent strike riots at Armentières and Bennebont, and reproached the Government for not interfering with the troops until after houses had been pillaged and burned. The Premier replied that troops were at hand, and that the failure to take action was due to the military commanders and not to the civil authorities. When the vote of confidence in the Government was called for, the Chamber of Deputies supported M. Combes by a vote of 332 to 233. Serious riots broke out in Paris last week, following a meeting of 6,000 persons, who protested against the establishment of municipal employment bureaus. The Prefect of Police announces that forty-five policemen were wounded and more than one hundred of the rioters. Count Lamsdorff, the Russian Foreign Minister, has left Paris, after a visit intended to strengthen the Franco-Russian alliance, and, as some say, to arrange an understanding with Great Britain whereby Russia was to be left in undisturbed possession of Manchuria in return for recognizing England's protectorate over Egypt.—At a Ministerial Council held in Rome, October 21st, Premier Zanardelli announced that he had sent in his resignation in consequence of failing health, and as a result the Cabinet decided by a unanimous resolution to resign. It is said that Signor Zanardelli's action is really due to the state of his health and has nothing to do with politics. There are three great questions before the Italian Government—relief for Southern Italy, the regulation of railways, and the renewal of treaties of commerce—and there ought to be no difficulty in forming a new administration on the basis of these matters.

Turkey and Bulgaria It looks as if all danger of war between Bulgaria and Turkey was certainly set aside for the winter. An order was issued in Sofia on October 27th for the complete demobilization of the Bulgarian reserves, who are to return to their homes. The mobilization of the Bulgarian army when the massacres in Macedonia were at their height, together with the centralization of Turkish troops

along the Bulgarian border, was what really made Europe realize the imminent danger of war. The Austro-Russian program was the result of this act, and, in so far, it may be said that the sacrifices necessary to Bulgaria for mobilizing her army were not taken in vain. An English correspondent, who has come in contact a good deal with the Bulgarian army, declares that he has never seen anything to equal these troops, except, perhaps, the battalions of the British army after the South African War. They drill well, their discipline is excellent and they show great keenness; their equipment is admirable in every respect. The Government at Constantinople has, for the moment, suspended the demobilization of the Turkish troops, meaning thus to show its independence in the face of Austria and Russia. Turkey, indeed, is not well pleased with the joint Austro-Russian note in regard to Macedonia, which was presented to the Porte on October 22d. The Austrian press states that the consent of all the Powers had been obtained to the proposals of this note before it was communicated to the Porte, but this is probably a mistake. It is supposed, generally, that Germany and Italy, at least, are not in sympathy with these Macedonian measures.—On the evening of October 27th Sagatel Sagouni, President of the Armenian Revolutionary Society, was murdered at the doorstep of his own home in one of the London suburbs. Sagouni had returned to London only a day or two before from Switzerland, whither he had gone to take charge of the affairs of an associate who was recently stabbed. His own assassination was presumably the work of a fellow Armenian from the United States, who represented the more radical body of Armenian revolutionists and who hated the moderate plans of Sagouni. This act of the Armenian Vendetta has caused no little excitement in London.—The recent killing of the Military Commandant, Ahmet Pasha, and of the Governor of the Province of Azir on the Red Sea coast of Arabia, was the result of a revolt of two Arab tribes against the imposition of the new cattle tax. In the fray about 1,000 Turkish troops were killed or wounded, and the rest of the

army was routed. Fifteen battalions of troops have now been dispatched to Azir, and General Hady Pasha has been appointed Commander-in-Chief and Governor.

The Transvaal Since the War

The British administration has dealt with many problems in the Transvaal since the war. The British subject residing in the Transvaal country before the war and the new settler have both been helped. No deserving case now exists where Government assistance might properly be extended in so far as the knowledge of the Government's representatives goes. No one however, can reasonably expect that the ravages of a nearly three years' war can be thoroughly repaired in a little over twelve months, but the extraordinary rapidity with which the recovery has been made has been astonishing. A careful observer who went over the country immediately after the declaration of peace and who has been continually traveling over the country since and watching the progress of the work of restoration, and who has but just returned from another tour of inspection, reports that his first journey revealed nothing but devastation, ruin and desolation, block houses and barbed wire, whereas the second trek showed houses built up, cattle, horses and live stock generally grazing on the veldt; great tracts of ground under cultivation, roads and drifts repaired, outlying towns that were formerly in ruins now rebuilt and prosperous, with every evidence of healthy growth. Local governments have generally been re-established, and the police, magistrates and officials of all kinds are engaged with the several duties of their various offices. Schools are full of happy children. Settlers now have courage, enterprise and hope. The Boers do not accept the new order of things entirely without misgiving, as the injury to their national pride cannot be at once healed, but they now seem to have faith and confidence in their new Government, which is likely to endure, unless the professed principles of integrity and fair play are not carried out by the English masters of the situation.

The Class Struggle

BY JACK LONDON

[Mr. London is the author of "The Call of the Wild" and a number of stories of the Klondike region which have placed him among the most popular of American writers. He is more than a literary man, however, being a student at first hand of social problems, as his latest book, "The People of the Abyss," will show. He is a Socialist. The following article is the best statement we have yet seen, from the radical standpoint, of the industrial and social conflict of classes.—EDITOR.]

FOR a class struggle to exist in society there must be, first, a class inequality, a superior class and an inferior class (as measured by power); and, second, the outlets must be closed whereby the strength and ferment of the inferior class have been permitted to escape. That there are even classes in the United States is vigorously denied by many; but it is incontrovertible, when a group of individuals is formed, wherein the members are bound together by common interests, which are peculiarly their interests and not the interests of individuals outside the group, that such a group is a class. The owners of capital, with their dependents, form a class of this nature in the United States; the working people form a similar class. The interest of the capitalist class, say, in the matter of income tax, is quite contrary to the interest of the laboring class; and, *vice versa*, in the matter of poll tax.

If between these two classes there be a clear and vital conflict of interest, all the factors are present which make a class struggle; but this struggle will lie dormant if the strong and capable members of the inferior class be permitted to leave that class and join the ranks of the superior class. The capitalist class and the working class have existed side by side and for a long time in the United States; but, hitherto, all the strong, energetic members of the working class have been

able to rise out of their class and become owners of capital. They were enabled to do this because an undeveloped country with an expanding frontier gave equality of opportunity to all. In the almost lottery-like scramble for the ownership of vast unowned natural resources, and in the exploitation of which there was little or no competition of capital (the capital itself arising out of the exploita-

JACK LONDON

tion), the capable, intelligent member of the working class found a field in which to use his brains to his own advancement. Instead of being discontented in direct ratio with his intelligence and ambitions, and of radiating among his fellows a spirit of revolt as capable as he was capable, he left them to their fate and carved his own way to a place in the superior class.

But the day of an expanding frontier, of a lottery-like scramble for the ownership of natural resources, and of the upbuilding of new industries, is past. Furthest West has been reached, and an immense volume of surplus capital roams for investment and nips in the bud the patient efforts of the embryo capitalist to rise through slow increment from small beginnings. The gateway of opportunity after opportunity has been closed, and closed for all time. Rockefeller has shut the door on oil, the American Tobacco Company on tobacco, and Carnegie on steel. After Carnegie came Morgan, who triple-locked the door. These doors will not open again, and before them pause thousands of ambitious young men to read the placard: No Thoroughfare.

And day by day more doors are shut, while the ambitious young men continue to be born. It is they, denied the opportunity to rise from the working class, who preach revolt to the working class. Had he been born fifty years later, Andrew Carnegie, the poor Scotch boy, might have risen to be president of his union, or of a federation of unions, but that he would never have become the builder of Homestead and the founder of multitudinous libraries is as certain as it is certain that some other man would have developed the steel industry had Andrew Carnegie never been born.

Theoretically, then, there exist in the United States all the factors which go to make a class struggle. There are the capitalist and working classes, the interests of which conflict; while the working class is no longer being emasculated to the extent it was in the past by having drawn off from it its best blood and brains. Its more capable members are no longer able to rise out of it and leave the great mass leaderless and helpless. They remain to be its leaders.

When a million and more of men, finding themselves knit together by certain interests peculiarly their own, band together in a strong organization for the aggressive pursuit of those interests, it is evident that society has within it a hostile and warring class. But when the interests which this class aggressively pursues conflict sharply and vitally with the interests of another class, class antagonism arises and a class struggle is the inevitable result. One great organization of labor alone has a membership of 1,250,000 in the United States. This is the American Federation of Labor, and outside of it are many other large organizations. All these men are banded together for the frank purpose of bettering their condition, regardless of the harm worked thereby upon all other classes. They are in open antagonism with the capitalist class, while the manifestos of their leaders state that the struggle is one which can never end.

Their leaders will largely deny this last statement, but an examination of their utterances, their actions and the situation will forestall such denial. In the first place, the conflict between labor and capital is over the division of the joint product. Capital and labor apply themselves to raw material and make it into a finished product. The difference between the value of the raw material and the value of the finished product is the value they have added to it by their joint effort. This added value is, therefore, their joint product, and it is over the division of this joint product that the struggle between labor and capital takes place. Labor takes its share in wages; capital takes its share in profits. It is patent, if capital took, in profits, the whole joint product, that labor would perish. And it is equally patent, if labor took, in wages, the whole joint product, that capital would perish. Yet this last is the very thing labor aspires to do, and that it will never be content with anything less than the whole joint product is evidenced by the words of its leaders.

Mr. Samuel Gompers, president of the American Federation of Labor, has said:

"The workers want more wages; more of the comforts of life; more leisure; more chance

for self-improvement as men, as trade unionists, as citizens. *These were the wants of yesterday; they are the wants of to-day; they will be the wants of to-morrow, and of to-morrow's morrow.* The struggle may assume new forms, but the issue is the immemorial one—an effort of the producers to obtain an increasing measure of the wealth that flows from their production."

Mr. Henry White, secretary of the United Garment Workers of America, and a member of the Industrial Committee of the National Civic Federation, speaking of the National Civic Federation soon after its inception, said:

"To fall into one another's arms, to avow friendship, to express regret at the injury which has been done, would not alter the facts of the situation. Workingmen will continue to demand more pay, and the employer will naturally oppose them. The readiness and ability of the workmen to fight will, as usual, largely determine the amount of their wages or their share in the product. . . . But when it comes to dividing the proceeds, there is the rub. We can also agree that the larger the product through the employment of labor-saving methods, the better, as there will be more to be divided, but again the question of the division. . . . A Conciliation Committee, having the confidence of the community and composed of men possessing practical knowledge of industrial affairs, can therefore aid in mitigating this antagonism, in preventing avoidable conflicts, in bringing about a *truce*—I use the word *truce* because understandings can only be temporary."

Man being man and a great deal short of the angels, the quarrel over the division of the joint product is irreconcilable. For the last twenty years in the United States there has been an average of over a thousand strikes per year; and year by year these strikes increase in magnitude and the front of the labor-army grows more imposing. And it is a class struggle, pure and simple. Labor, as a class, is fighting with capital, as a class.

Workingmen will continue to demand more pay, and employers will continue to oppose them. This is the keynote to *laissez faire*. Everybody for himself and devil take the hindmost. It is upon this that the rampant individualist bases his individualism. It is the let-alone policy, the struggle for existence which strengthens the strong,

destroys the weak, and makes a finer and more capable breed of men. But the individual has passed away and the group has come, for better or worse, and the struggle has become, not a struggle between individuals, but a struggle between groups. So the query rises: Has the individualist never speculated upon the labor-group becoming strong enough to destroy the capitalist-group and take to itself and run for itself the machinery of industry? And, further, has the individualist never speculated upon this being still a triumphant expression of individualism, of group individualism, if the confusion of terms may be permitted?

But the facts of the class struggle are deeper and more significant than have so far been presented. A million or so of workmen may organize for the pursuit of interests which engender class antagonism and strife, and at the same time be unconscious of what is engendered. But when a million or so of workmen show unmistakable signs of being conscious of their class, of being, in short, "class conscious," then the situation grows serious. The uncompromising and terrible hatred of the trade unionist for a scab is the hatred of a class for a traitor to that class, while the hatred of a trade unionist for the militia is the hatred of a class for a weapon wielded by the class with which it is fighting. No workman can be true to his class and at the same time be a member of the militia—this is the dictum of the labor leaders.

In the town of the writer, the good citizens, when they get up a Fourth of July parade and invite the labor unions to participate, are informed by the unions that they will not march in the parade if the militia marches. Article 8 of the constitution of the Painters' and Decorators' Union of Schenectady provides that a member must not be a

"militiaman, special police officer, or deputy marshal in the employ of corporation or individuals during strikes, lockouts or other labor difficulties, and any member occupying any of the above positions will be debarred from membership."

Mr. William Potter was a member of this union and a member of the National Guard. As a result, because he

obeyed the order of the Governor when his company was ordered out to suppress rioting, he was expelled from his union. Also his union demanded that his employers, Shafer & Barry, discharge him from their service. This they complied with, rather than face the threatened strike.

Mr. Robert L. Walker, first lieutenant of the Light Guards, a New Haven militia company, recently resigned. His reason was that he was a member of the Car Builders' Union, and that the two organizations were antagonistic to each other. During a New Orleans street car strike not long ago, a whole company of militia, called out to protect non-union men, resigned in a body. Mr. John Mulholland, president of the International Association of Allied Metal Mechanics, has stated that he does not want the members to join the militia. The Local Trades Assembly of Syracuse, N. Y., has passed a resolution by unanimous vote requiring union men who are members of the National Guard to resign under pain of expulsion from the unions. The Amalgamated Sheet Metal Workers' Association has incorporated in its constitution an amendment excluding from membership in its organization "any person a member of the regular army or of the State militia or naval reserve." The Illinois State Federation of Labor, at a recent convention, passed without a dissenting vote a resolution declaring that membership in military organizations is a violation of labor union obligations, and requesting all union men to withdraw from the militia. The president of the Federation, Mr. Albert Young, declared that the militia was a menace not only to unions, but to all workers throughout the country.

These instances may be multiplied a thousand-fold. The union workmen are becoming conscious of their class and of the struggle their class is waging with the capitalist class. To be a member of the militia is to be a traitor to the union, for the militia is a weapon wielded by the employers to crush the workers in the struggle between the warring groups.

Another interesting and even more pregnant phase of the class struggle is the political aspect of it as displayed by

the Socialists. Five men standing together may perform prodigies; five hundred men, marching as marched the historic Five Hundred of Marseilles, may sack a palace and destroy a king; while three hundred thousand men, passionately preaching the propaganda of a class struggle, waging a class struggle along political lines, and backed by the moral and intellectual support of ten million more men of like convictions throughout the world, may come pretty close to realizing a class struggle in these United States of ours.

In 1900 these men cast 150,000 votes; two years later, in 1902, they cast 300,000 votes; and in 1904 they promise to cast 500,000 votes. They have behind them a most imposing philosophic and scientific literature; they own illustrated magazines and reviews, high in quality, dignity and restraint; they possess countless daily and weekly papers which circulate throughout the land and single papers of which have subscribers by the hundreds of thousands; and they literally swamp the working classes in a vast sea of tracts and pamphlets. No political party in the United States, no church organization or mission effort, has as indefatigable workers as has the Socialist Party. They multiply themselves, know of no effort or sacrifice too great to make for the Cause; and "Cause," with them, is spelled out in capitals. They work for it with a religious zeal, and would die for it with a willingness similar to that of the Christian martyrs.

These men are preaching an uncompromising and deadly class struggle. In fact, they are organized upon a basis of a class struggle. Hear them:

"The history of society is a history of class struggles. Patrician struggled with plebeian in early Rome; the king and the burghers with the nobles in the Middle Ages; later on, the king and the nobles with the bourgeoisie; and to-day the struggle is on between the triumphant bourgeoisie and the rising proletariat. By proletariat is meant the class of people without capital, which sells its labor for a living.

"That the proletariat shall conquer (mark the note of fatalism), is as certain as the rising sun. Just as the bourgeoisie of the eighteenth century wanted democracy applied to politics, so the proletariat of the twentieth century wants democracy applied to industry. As

the bourgeoisie complained against the Government being run by and for the nobles, so the proletariat complains against the Government and industry being run by and for the bourgeoisie; and so, following in the footsteps of its predecessor, the proletariat will possess itself of the Government, apply democracy to industry, abolish wages, and run the business of the country in its own interest.

"Their aim, they say, is to organize the working class, and those in sympathy with it, into a political party, with the object of conquering the powers of government and using them for the purpose of transforming the present system of private ownership of the means of production and distribution into collective ownership by the entire people."

Briefly stated, this is the battle-plan of these 300,000 men who call themselves "Socialists." And in the face of the existence of such an aggressive group of men a class struggle cannot very well be denied by the optimistic Americans who say: "A class struggle is monstrous. Sir, there is no class struggle." The class struggle is here, and the optimistic American had better gird himself for the fray and put a stop to it rather than sit idly declaiming that what ought not to be is not and never will be.

But the Socialists, fanatics and dreamers tho they may well be, betray a foresight and insight and a genius for organization which put to shame the class with which they are openly at war. Failing rapid success in waging a sheer political propaganda, and finding that they were alienating the most intelligent and most easily organized portion of the voters, the Socialists lessoned from the experience and turned their energies upon the trade union movement. To win the trade unions was well-nigh to win the war, and recent events show that they have done far more winning in this direction than have the capitalists.

Instead of antagonizing the unions, which had been their previous policy, the Socialists proceeded to conciliate the unions. "Let every good Socialist join the union of his trade," the edict went forth. "Bore from within and capture the trade union movement." And this policy, only several years old, has reaped fruits far beyond their fondest expectations. To-day the great labor unions are honeycombed with

Socialists, "boring from within," as they picturesquely term their undermining labor. At work and at play, at business meeting and council, their insidious propaganda goes on. At the shoulder of the trade unionist is the Socialist, sympathizing with him, aiding him with head and hand, suggesting—perpetually suggesting—the necessity for political action. As the *Journal*, of Lansing, Mich., a Republican paper, has remarked:

"The Socialists in the labor unions are tireless workers. They are sincere, energetic and self-sacrificing. . . . They stick to the union and work all the while, thus making a showing, which, reckoned by ordinary standards, is out of all proportion to their numbers. . . . Their cause is growing among union laborers, and their long fight intended to turn the Federation into a political organization is likely to win."

By their tireless efforts the Socialists have already come within an ace of capturing the great American Federation of Labor, with its million and a quarter of members and the population of six millions which they represent. In 1900 the Socialist delegates at the National Convention attempted to carry a straight-out Socialist resolution pledging the Federation to political action. But they were defeated by a substitute resolution on a vote of 4,169 to 685. The following year they were side-tracked. But last year, at the New Orleans Convention, their show of strength surprised even themselves. Instead of controlling one-sixth of the vote, they found that they controlled nearly one-half. They lost, but they lost by a vote of 4,774 to 4,344—a record for "boring from within" the significance of which has not been noticed by the class upon whom they have declared battle without quarter.

Night and day, tireless and unrelenting as a mortgage, they labor at their self-imposed task of undermining society. Mr. M. G. Cuniff, who lately made an intimate study of trade unionism, says: "All through the unions Socialism filters. Almost every other man is a Socialist, preaching that unionism is but a makeshift." "Malthus be damned," they told him, "for the good time was coming when every man should be able to rear his family

in comfort." In one union, with two thousand members, Mr. Cuniff found every man a Socialist, and from his experiences Mr. Cuniff was forced to confess "I lived in a world that showed our industrial life a-tremble from beneath with a never-ceasing ferment."

The Socialists have already captured the Western Federation of Miners, the Western Hotel and Restaurant Employees' Union and the Patternmakers' National Association. The Western Federation of Miners, at its last convention, declared:

"The strike has failed to secure to the working classes their liberty, we therefore call upon the workers to strike as one man for their liberties at the ballot-box. . . . We put ourselves on record as committed to the program of independent political action. . . . We indorse the platform of the Socialist Party, and accept it as the declaration of principles of our organization. We call upon our members as individuals to commence immediately the organization of the Socialist movement in their respective towns and States, and to co-operate in every way for the furtherance of the principles of Socialism and of the Socialist Party. In States where the Socialist Party has not perfected its organization, we advise that every assistance be given by our members to that end. . . . We therefore call for organizers, capable and well versed in the whole program of the labor movement, to be sent into each State to preach the necessity of organization on the political as well as the economic field."

The capitalist class has a glimmering consciousness of the class struggle which is shaping itself in the midst of society; but the capitalists, as a class, seem to lack the ability for organizing, for coming together, such as is possessed by the working class. No American capitalist ever aids an English capitalist in the common fight, while workmen have formed international unions, the Socialists a world-wide international organization, and on all sides space and race are bridged in the effort to achieve solidarity. Resolutions of sympathy, and, fully as important, donations of money, pass back and forth across the sea to wherever labor is fighting its pitched battles.

For divers reasons the capitalist class lacks this cohesion or solidarity, chief among which is the optimism bred of past success. And, again, the cap-

italist class is divided; it has within itself a class struggle of no mean proportions, which tends to irritate and harass it and to confuse the situation. The small capitalist and the large capitalist are grappled with each other, struggling over what Achille Loria calls the "bi-partition of the revenues." Such a struggle, tho not precisely analogous, was waged between the landlords and manufacturers of England, when the one brought about the passage of the Factory Acts and the other the repeal of the Corn Laws.

Here and there, however, certain members of the capitalist class see clearly the cleavage in society along which the struggle is beginning to show itself, while the press and magazines are beginning to raise an occasional and troubled voice. Two leagues of class conscious capitalists have been formed for the purpose of carrying on their side of the struggle. Like the Socialists, they do not mince matters, but state boldly and plainly that they are fighting to subjugate the opposing class. It is the barons against the commons. One of these leagues, the National Association of Manufacturers, is stopping short of nothing in what it conceives to be a life and death struggle. Mr. D. M. Parry, who is the president of the League, as well as president of the National Metal Trades Association, is leaving no stone unturned in what he feels to be a desperate effort to organize his class. He has issued the call to arms in terms everything but ambiguous:

"There is still time in the United States to head off the Socialistic program, which, unrestrained, is sure to wreck our country."

As he says, the work is for

"federating employers in order that we may meet with a united front all issues that affect us. We must come to this sooner or later. . . . The work immediately before the National Association of Manufacturers is, first, *keep the vicious Eight-Hour bill off the books*; second, *to destroy the Anti-Injunction bill*, which wrests your business from you and places it in the hands of your employees; third, *to secure the passage of the Department of Commerce and Industry bill*—the latter would go through with a rush were it not for the hectoring opposition of organized labor."

By this department, he further says,

"business interests would have direct and sympathetic representation at Washington."

In a later letter, issued broadcast to the capitalists outside of the League, President Parry points out the success which is already beginning to attend the efforts of the League at Washington.

"We have contributed more than any other influence to the quick passage of the new Department of Commerce bill. It is said that the activities of this office are numerous and satisfactory; but of that I must not say too much—or anything. . . . At Washington the Association is not represented too much, either directly or indirectly. Sometimes it is known in a most powerful way that it is represented vigorously and unitedly. Sometimes it is not known that it is represented at all."

The second class conscious capitalist organization is called the National Economic League. It likewise manifests the frankness of men who do not dilly dally with terms, but who say what they mean, and who mean to settle down to a long, hard fight. Their letter of invitation to prospective members opens boldly:

"We beg to inform you that the National Economic League will render its services in an impartial educational movement to oppose Socialism and class hatred."

Among its class conscious members, men who recognize that the opening guns of the class struggle have been fired, may be instanced the following names: Hon. Lyman J. Gage, ex-Secretary United States Treasury; Hon. Thomas Jefferson Coolidge, ex-Minister to France; Rev. Henry C. Potter, Bishop of New York Diocese; Hon. John D. Long, Secretary of United States Navy; Hon. Levi P. Morton, ex-Vice-President of the United States; Henry Clews; John F. Dryden, President of the Prudential Life Insurance Company; John A. McCall, President of the New York Life Insurance Company; J. L. Greatsinger, President of the Brooklyn Rapid Transit Company; the shipbuilding firm of Wm. Cramp & Sons; the Southern Railway System, and the Atchison, Topeka & Santa Fé Railway Company.

Instances of the troubled editorial voice have not been rare during the last

twelve months. 'There were many cries from the press during the last days of the anthracite coal strike that the mine owners, by their stubbornness, were sowing the regrettable seeds of Socialism. The *World's Work* for December, 1902, said:

"The next significant fact is the recommendation by the Illinois State Federation of Labor that all members of labor unions who are also members of the State militia shall resign from the militia. This proposition has been favorably regarded by some other labor organizations. It has done more than any other single recent declaration or action to cause a public distrust of such unions as favor it. *It hints of a class separation that, in turn, hints of anarchy.*"

The *Outlook*, February 14th, 1903, in reference to the rioting at Waterbury, remarks:

"That all this disorder should have occurred in a city of the character and intelligence of Waterbury indicates that the industrial war spirit is by no means confined to the immigrant or ignorant working classes."

That President Roosevelt has smelt the smoke from the firing-line of the class struggle is evidenced by his words:

"Above all, we need to remember that any kind of *class animosity in the political world* is, if possible, even more destructive to national welfare than sectional, race or religious animosity."

The chief thing to be noted here is President Roosevelt's tacit recognition of class animosity in the industrial world, and his fear, which language cannot portray stronger, that this class animosity may spread to the political world. Yet this is the very policy which the Socialists have announced in their declaration of war against present-day society—to capture the political machinery of society and by that machinery destroy present-day society.

THE INDEPENDENT, in an editorial published February 12th, 1903, recognized without qualification the class struggle:

"It is impossible fairly to pass upon the methods of labor unions, or to devise plans for remedying their abuses, until it is recognized, to begin with, that unions are based upon class antagonism, and that their policies are dictated by the necessities of social warfare. A strike is a rebellion against the owners of

property. The rights of property are protected by government. And a strike, under certain provocation, may extend as far as did the general strike in Belgium a few years since, when practically the entire wage-earning population stopped work in order to force political concessions from the property-owning classes. This is an extreme case, but it brings out vividly the real nature of labor organization as a species of warfare whose object is the coercion of one class by another class."

It has been shown, theoretically and actually, that there is a class struggle in the United States. The quarrel over the division of the joint product is irreconcilable. The working class is no longer losing its strongest and most capable members. These men, denied room for their ambition in the capitalist ranks, remain to be the leaders of the workers, to spur them to discontent, to make them conscious of their class, to lead them to revolt.

This revolt, appearing spontaneously all over the industrial field in the form of demands for an increased share of the joint product, is being carefully and shrewdly shaped for a political assault upon society. The leaders, with the carelessness of fatalists, do not hesitate for an instant to publish their intentions to the world. They intend to direct the labor revolt to the capture of the political machinery of society. With the political machinery once in their hands, which will also give them the control of the police, the army, the navy and the courts, they will confiscate, with or without remuneration, all the possessions of the capitalist class which are used in the production and distribution of the necessities and luxuries of life. By this they mean to apply the law of eminent domain to the land, and to extend the law of eminent domain till it embraces the mines, the factories, the railroads and the ocean carriers. In short, they intend to destroy present-day society, which they contend is run in the interest of another class, and from the materials to construct a new society which will be run in their interest.

On the other hand, the capitalist class is beginning to grow conscious of itself and of the struggle which is being waged. It is already forming offensive and defensive leagues, while some of the most prominent figures in the nation are preparing to lead it in the attack upon Socialism.

The question to be solved is not one of Malthusianism, "projected efficiency," or ethics. It is a question of might. Whichever class is to win, will win by virtue of superior strength; for the workers are beginning to say, as they said to Mr. Cuniff, "Malthus be damned." In their own minds they find no sanction for continuing the individual struggle for the survival of the fittest. As Mr. Gompers has said, they want more, and more, and more. The ethical import of Mr. Kidd's plan of the present generation putting up with less in order that race efficiency may be projected into a remote future has no bearing upon their actions. They refuse to be the "glad perishers" so glowingly described by Nietzsche.

It remains to be seen how promptly the capitalist class will respond to the call to arms. Upon its promptness rests its existence, for if it sit idly by, soothfully proclaiming that what ought not to be cannot be, it will find the roof-beams crashing about its head. No three thousand of its members, much less three hundred thousand, are organized to crush the revolt which is spreading with such rapidity. The capitalist class is in the numerical minority, and bids fair to be outvoted if it does not put a stop to the vast propaganda being waged by its enemy. Nor in this direction has it as yet conceived any adequate plan, such as its assailants have conceived and are putting into execution in their attempt to capture the trade union movement with its millions of votes. It is no longer a question of whether or not there is a class struggle. The question now is, what will be the outcome of the class struggle?

PIEDMONT CAL.

A French Gift to America

BY THE COUNT DE ROCHAMBEAU

I N the number of THE INDEPENDENT for May 14th last I gave a brief account of the bust of Washington by David d'Angers which some of the French friends of the United States intend to place in the capitol at Washington. I am now able to state that the bust, cast by Hohwiller; the pedestal, cut from the marble quarries of Berring Nicoli at Carrara; the bronze plate, in the style of Louis XVI, made by the talented artist in metal, Charles Dupont, are all fin-

ished, and the completed work is about to be boxed and shipped to the French Ambassador at Washington. We trust that the little monument will be in place before Congress meets this autumn. I am happy to be able to state, therefore, that this patriotic act, conceived by a little group of old friends of America, and warmly approved by the French Ministers of Foreign Affairs, War and Marine, has been brought to a successful conclusion.

PARIS, FRANCE.

The Hague Arbitration Tribunal

BY W. T. STEAD

EDITOR OF "THE REVIEW OF REVIEWS" AND AUTHOR OF THE "AMERICANIZATION OF THE WORLD," ETC.

THE International Court at The Hague will reassemble on the 2d November, to resume the hearing of the case which was opened, somewhat out of due order, by Mr. MacVeagh, at the beginning of October; but it is expected that the sittings of the Court will be over by the 18th November, when the judges will adjourn, and take some time to make up their minds as to the question which will have been pleaded before them by the representatives of the parties concerned. Altho, it may appear to a cursory observer that the question under discussion is comparatively trivial, a very short examination will dissipate this impression. The first question heard before The Hague Court was of minor importance. It was a dispute between the Governments

of the United States and of Mexico as to the proper distribution of certain endowments which had been left to the Catholic Church in California before the cession of that country to the United States. The judges represented three Powers, the litigants represented two. Five Powers, therefore, were all those who had any personal interest in the case. The present question involves directly or indirectly no fewer than fifteen Powers. Of these, eleven are directly represented before the Court; two others are repre-

sented on the judgment seat, and the fourteenth and fifteenth, altho not directly represented in the Court, regard themselves as sufficiently interested in the question at issue to render it improper for their judges to sit in judgment on the case.

The two Powers who are interested, altho not represented at the Court, are Denmark and Switzerland. The fact that they had not entered claims led the Russian Government to nominate a Dane and a Swiss as members of the Court; but they had no sooner done so than it was discovered that both Denmark and Switzerland had claims against Venezuela, which therefore disqualified their judges from forming part of the International Tribunal constituted to settle the question. The

W. T. STEAD

other eleven Powers represented by counsel in the Court are the United States and Mexico and Venezuela, of the New World; Great Britain, France, Germany, Spain, Sweden and Norway, Holland, Belgium and Italy. Sweden and Norway have deputed the representation of their interests to the representative of another small Power.

These eleven Powers are directly represented before the Court, while two are represented on the judgment seat. According to the original intention of the

Russian Government, the Court was to be constituted by a Russian, a Dane and a Swiss. Owing to the refusal of the Dane and Swiss to serve, the *personnel* had to be recast, with the result that the Court now consists of two Russians, M. Mouravieff, Minister of Justice, cousin of the late Foreign Minister of Russia, and M. de Martens, who has taken part in so many arbitrations and always with such distinction as to have earned the *sobriquet* of "Chief Justice of Christendom," and M. Lammasch, who was one of the Austrian delegates at The Hague Conference. The Court, therefore, took into account both the judges and those who will appear before the judgment seat, or are directly interested, represented of every European country, with the exception of Turkey and Portugal.

The third arbitration now entered before The Hague Court will come on for hearing in January. Only five nations will be directly represented. This is the question of the house tax in Japan, in which England, France and Germany are on one side against Japan on the other. The Court will consist of M. Motono, the Japanese judge; M. Renault, as the representative of England, France and Germany, and a Norwegian, who will be President of the Tribunal. I went over to The Hague in October for the purpose of hearing from those engaged in the Court how things were going. I had opportunities of discussing matters with the Prime Minister of Holland and various members of the Court, as well as the representatives of the Powers who are accredited at the Dutch capital. I think it will be of some interest to readers of THE INDEPENDENT to hear exactly how things stand.

In the first case the tribunal as constituted is regarded with the utmost confidence by the representatives of the United States and of Venezuela. Of M. de Martens it is unnecessary to say anything. He was appointed in accordance with the expressed wish of the Powers whose case was under decision. No one commands such respect, and it was only on that account that the Russian Government consented to nominate a second Russian to serve in the Court. It is admitted that in principle it is objectionable that any one Power should have two

judges on a tribunal of three; but the international fame of M. de Martens is so well established that, so far from objecting to his presence as a second Russian, it was absolutely desired by those upon whose claim he is to pronounce judgment.

M. de Martens is thoroughly familiar with English, which he speaks and writes fluently—a matter of the very first importance in a case where, thanks chiefly to the insistence of Mr. Bowen, it was stipulated that the proceedings of the Court should be in English.

M. Lammasch, the Austrian, also an intelligent, upright, public-spirited man, is equally familiar with the English language.

M. Mouravieff, a very clever man of quick intelligence and of keen intellect, labors under one great disadvantage. Altho he can read English, he understands it imperfectly, and has to be prompted at the right hand and the left by his Austrian and Russian colleagues. This is distinctly unfortunate, and it is somewhat surprising that, knowing his deficiency in this respect, he consented to accept nomination to the post. According to the protocol, by virtue of which alone this Court has come into existence, all the proceedings, but not the arguments, must be in English. The proceedings include all utterances from the bench, but M. Mouravieff, altho President of the tribunal, has never spoken anything but French. On the opening day, when he sat alone on the bench, he addressed the Court in French, but promised that an English translation of his speech should appear in the proceedings. At the later sittings, when the Court was properly constituted with three judges, he gave his decision on points raised by counsel in French, which is a distinct infraction of the conditions of the protocol. Fortunately, Mr. Bowen, who represents Venezuela, is at home in the French language, but it was felt in Court that the President's remarks ought always to have been translated in order to comply with the conditions of the agreement by which the Court came into existence. Unfortunately, there is no official translator, as there is no official stenographer. This is a defect which will have to be remedied. The Court has no funds available for reporting its own pro-

ceedings. Hence the only report is that which is taken by the stenographers of such Powers as choose to employ them, and the reports, of course, solely belong to the Powers concerned. I ran up against this curious defect in the constitution of the Court in my quest for a shorthand report of Mr. MacVeagh's speech. Altho my visit was some days after Mr. MacVeagh had concluded his twelve hours' oration, I found that the only record that existed was in the shorthand writer's notes, not yet fully transcribed; that no person in The Hague had had any report of the speech, and that it would not be published until the American stenographic report had been sent over to Washington to be revised by Mr. MacVeagh. The cost of an official stenographic report would not be more than \$500, but the Council of Administration, which provides for the up-keep of the building, has not appropriated so much as 500 cents for providing an authentic record of proceedings for its own archives.

The Court itself is still held in the same building, which was rented by the Administrative Council for its sittings. Mr. Carnegie's generous gift of \$1,250,000 to provide a Palace of Justice has not yet been spent. The site has not yet been fixed. Speculators in real estate have formed syndicates which have secured options upon all the possible sites with the intent of making a handsome sum out of the Carnegie gift. A commission has been appointed, composed of Dutch members of the International Court, together with several Dutch architects, for the purpose of selecting a site, and inviting an international competition for buildings to be placed thereon. The story goes in The Hague that no member of the Commission can take his walks abroad in any part of the capital without the price of real estate rising immediately in that quarter. At present it is believed that the choice of the Commission will fall upon a site near the beginning of the road to Scheveningen, a large estate formerly occupied by the Duke of Saxe-Weimar, which was offered to the town by its present owner, Mr. Goekoop, for four and a half million florins (about \$1,875,000). The whole of this property would not be needed for the site of the Palace of Jus-

tice, but meantime the interest upon Mr. Carnegie's gift is accumulating at the rate of about \$150 a day.

The question before the Court may be briefly stated as follows: Eleven Powers have claims against Venezuela, the amount of which has been settled by a mixed Commission in the country. The question of the amounts that are to be paid by Venezuela to each country does not come before the Court. The judgment is invoked solely as to whether the Powers which took part in the blockade to enforce payment of these sums are entitled to claim that the sums due to them should be paid before the payment of the moneys due to other Powers. The contention of Venezuela and of all the other Powers, with the exception of England, Germany and Italy, who took part in the blockade, is that all creditors should stand on equal footing. England, Germany and Italy contend that as they undertook to bell the cat, they ought to rank first, and that their claims should be paid in full before any money is handed over to the other creditors.

It is obvious that if the principles prevailing in civil law between individuals are to be recognized as governing claims made by nations upon each other, the contention of the blockading Powers has not a leg to stand upon. If a private debtor fails to meet his engagements, and he is made bankrupt by any one of his creditors, an official receiver is appointed, who takes over all the assets of the bankrupt, collects evidence as to all the claims on the estate, and divides the assets equally among all the creditors, unless any one of the latter can prove that they have an express contract entitling them to priority of treatment. It is not contended that England, Germany and Italy have any such contract. Their claims are neither better nor worse than those of the other creditors, but the blockading Powers contend that the action which they took to bring Venezuela to book entitled them to a first claim upon the debtor's estate. If the analogy of civil law is taken to govern international relations, then the blockading Powers might claim that their expenses should be paid out of any division of the estate to be made between the various claims, their own included. This, however, does not seem to

have been put forward by England, Germany or Italy. The sum that is available for distribution consists of a certain proportion of the customs dues, and if the three blockading Powers were to have preferential rights over the whole of this sum it would be years before the other Powers, the United States included, would receive a cent.

Now behind this simple issue lie concealed some of the most important questions on which any international tribunal could ever be called upon to pronounce. For instance, if the three judges should decide that the English, German and Italian claim was justified, it would put a direct premium upon high-handed and precipitate action, which is surely the very last result to be desired by any member of The Hague Court. Supposing, for instance, that some South American republic were to be in difficulties, and it were to be ruled that the Power that first resorted to force was entitled to pocket all the assets and only leave the residue for the other creditors, such a decision would tend directly to incite every creditor nation to forestall all her possible rivals by being the first to appeal to the arbitrament of war, for war it is, even altho it may be disguised under the phrase of a pacific blockade.

But, altho this is of great importance, it is perhaps of less immediate significance than the question which was raised in a more or less provocative fashion by Mr. MacVeagh, whose speech, it is only right to say, was regarded with much dismay by his friends, and with much irritation by the representatives of the other Powers. For Mr. MacVeagh opened the case for Venezuela in a most offensive fashion against England. Do not let it be understood for a moment that I object to any criticism which Mr. MacVeagh or any American may feel justified in directing against England; but, as a Foreign Minister accredited to The Hague said to me, if speeches like that were to be permitted before The Hague Tribunal, it would not be a tribunal of peace, but a tribunal of war. If the acts which foreign Powers have sanctioned on their own responsibility are to be impugned in this tone, and submitted to the judgment of other Powers, no foreign Powers with any regard to their own honor will con-

sent to an appeal to The Hague Court. For, reduced to its essence, Mr. MacVeagh's speech, so far as I could gather from the abbreviated newspaper reports and from statements made to me by those who have heard it, consisted in an arraignment of the action of England in resorting to arms for the collection of her debts, in terms which, to say the least, were unusual before a European tribunal. The way in which the question was put by him was practically a challenge to the tribunal to condemn the action of England on account of her deviation from the policy of pacific pressure, backed by an appeal to arbitration, which the United States Government has always pursued in dealing with defaulting South American republics. It may be quite true that the method of the United States in dealing with defaulting debtors in the New World represents a much higher ethical standard than that of Great Britain, but for the American counsel to challenge the decision of a Court composed of two Russians and an Austrian on that subject seems doubtful policy, to say the least. England might stand it, for England will stand almost anything from the United States of America; but if Mr. MacVeagh had selected Germany, instead of Great Britain, as the special butt of his invectives we should have heard a good deal more of it before now. To ridicule the action of any great Power which has consented to refer its case to the pacific arbitrament of an international tribunal in terms which may be familiar in American court rooms, but which jar strangely upon the ears of European diplomats, is hardly a course calculated to conduce to the success of this method of settling disputes. It may be true that Great Britain's action in invoking German and Italian support, in order to collect the debts of her subjects by the formidable apparatus of blockade and bombardment, does resemble the training of a hundred-ton gun upon a blue-tailed fly, but the good taste and policy of holding up her action to ridicule and contempt may be questioned, even in the United States, as it certainly has been by the representatives of other Powers at The Hague.

So far as England is concerned, I have heard no protest or objection, and, as it was pointed out to me in mitigation of

this criticism, Mr. MacVeagh spoke very idiomatic American, and the probability is that even the two English-speaking members of the tribunal failed to appreciate, I would hardly say the polish of,

his invective. As for the President of the tribunal, his comparative ignorance of the English language left him in happy oblivion of the observations of Mr. MacVeagh.

THE HAGUE, HOLLAND.

On the Manufacture and Marketing of a Religion

BY WILLIAM E. BARTON, D.D.

PASTOR OF THE FIRST CONGREGATIONAL CHURCH OF OAK PARK, ILLINOIS

TALLEYRAND is credited with a bright reply, made to a man who announced his intention of founding a new religion, and who wanted advice upon its beginning. "I would advise you to be crucified, and to rise the third day," is said to have been the reply of the astute Talleyrand. I have heard the remark quoted as an argument in favor of the Christian religion, the assumption being that nothing less than this would insure popular acceptance of a new system of belief. I am about to show a simpler way. It is not very difficult to originate a religion, and to secure for it somewhat wide acceptance. No extraordinary ability is required to become acknowledged as Elijah or even as Jesus Christ. "What is the secret of his power?" ask men of each new pretender. There is no very great secret about it. Great power is not a necessary requisite, nor a sacrifice at all likely to be required. He who will found a new religion can gain from current history many valuable suggestions, all tending to show that crucifixion, with the attendant risk of not being the subject of a resurrection, is not a modern necessity.

But not every such religion is available for study in its entirety to students of a given generation. Frequently, by the time a religion is full grown, the people are dead who know how it arose. For this reason I count the following story of value, for I have witnessed within the compass of a quarter century the rise, progress, culmination, decline and col-

lapse of a religion, and one that has in it valuable hints for the prospective manufacturer of religions, as well as warnings for other people.

Twenty-five years ago the present autumn I worked as clerk in the post office in Stillman Valley, Illinois, and thereby paid my board while I attended school and prepared for college. The postmaster, Mr. Gideon Johnson, was an elderly man, and a retired Congregational minister. Across the river lay the village of Byron, whose pastor at that time was Rev. Mr. Beekman. Mr. and Mrs. Beekman visited back and forth with Mr. and Mrs. Johnson, and I sat at the table and came to know the Beekmans, superficially, but in a way that gave me great interest in what later occurred. Mr. Beekman was a modest and faithful man, and impressed me as a man of ability, but Mrs. Beekman was given to answering the questions which were put to him. However, she was ladylike, magnetic, and more brilliant than her husband, tho not, I judge, a person of remarkable ability.

During my stay in that region Mr. Beekman was taken sick, and his wife occupied the pulpit. My impression is that at first she preached the sermons which he had prepared, and then preached on the basis of his suggestions and outlines, and then preached her own sermons. When Mr. Beekman returned to the pulpit a portion of his congregation had expressed a strong preference for his wife. I have known several cases in which a minister's wife

filled the pulpit in her husband's absence, and in every case many people said, "She preaches better than her husband." I am not prepared to deny the statement as made of Mrs. Beekman or any of the others. It may have been true in every case, but the congregation would have said it even if it had not been true.

So far as I ever learned, Mr. Beekman bore himself in that trying emergency with great patience and Christian fortitude. For a time he preached the sermon, and his wife followed regularly with a Bible reading as a part of the same service; but it did not unify the congregation. Mrs. Beekman held little meetings in her parlor; she organized her followers into a compact group; they flattered her more and more, and showed in countless ways their preference for her as against her husband. And she, poor woman, at this time, I suppose, cherishing no set purpose of disloyalty to him or to the Church, led them on, and was led by them.

In time she made claim of plenary inspiration. Her disciples eagerly admitted it, and invited her to claim more. Did not the Lord himself speak through her? Was not His Spirit within her? At length she went the whole length, and asserted confidently that in her Jesus the Christ lived again. She based her claim, ostensibly, on the twelfth chapter of Revelation, with its vision of the woman standing in the sun.

By this time the break between her followers and the Church was inevitable, and also the break between herself and her husband. In all those months I never heard repeated from him a word against his wife. Whatever dissensions arose within the home were not made public. With dignity and gentleness of spirit Mr. Beekman suffered and plodded on his way. The little church, too, was nobly faithful. A considerable company had been led away. The discussions set all the gossips of the village a-going, but the body of the church, wisely counseled by the officers, and inspired by the patient spirit of the sorrowing pastor, stood by him in a manner worthy of all commendation.

Mrs. Beekman now left her home and went to and fro in the land. In Michigan, Wisconsin, Minnesota and Dakota she organized churches, and at Byron

she established her center of operations. From among humble farmers and tradesmen of the neighborhood she selected eleven men, and named them for the apostles. I knew her Peter moderately well. She had no Judas, at least by name, but she made the number good, and the name would not have been inappropriate. John the Baptist was, however, the title which she bestowed upon one, Schweinfurth, a red-headed apostle whom she brought from Michigan to Byron, and made the leader in her apostolic college.

I pass over certain rumors of her relations with Schweinfurth, which were afloat even at this time. I have more important things to tell, and there was never any doubt who among her followers stood closest to her. By this time the region about Byron was alive with talk about her, and my own room-mate went to hear her, with this result. First, that she seemed to him to be less like other preachers than he expected; secondly, that she seemed to be saying very many things that were good; thirdly, that whether she was deluded or not, she seemed to him to be sincere; and finally, that a person who said so many good things and was so manifestly sincere must be what she claimed to be. And so my friend went over to her, body and soul, and became one of her most ardent disciples.

It came to pass in time that Mrs. Beekman died. It was in Dakota, if I am not mistaken; certainly it was at a distance from Byron. The news of her death for a day disconcerted her followers. On the second day they began to gather about the body, and wait to see her rise on the third day. The third day passed, and her followers began to scatter, and the body was shipped back to Byron. There was some feeble attempt at a demonstration there, but her followers were too much dumfounded to act in concert. Then Mr. Beekman came, with a few strong and faithful friends, and said, "This matter ends now. While she lived you had your way. Now I will bury my wife, and the tragedy of my own home, at least, shall be at an end."

They held a very brief service out of doors; there were good reasons by that time for not holding it within, in the house or church, and it was better so, and the faithful minister went back to

his wrecked home, and his pale face and bent form appeared for some little longer time in the pulpit. Then he resigned, and, I think, is not now living. I do not find his name in the Year Book. But living or dead, he bore himself through that long martyrdom as a Christian and a gentleman.

Enter Schweinfurth, who says that on the third day after the death of Mrs. Beekman he became conscious of the re-incarnation of her spirit in him, and that he, from henceforth, is the immortal Christ. And the poor, mourning followers of Mrs. Beekman dried their tears and broke forth into joy. The second coming of Christ was now a completed fact. The woman standing in the sun was a temporary incarnation; they saw it all now, and plainly. Schweinfurth was the man-child!

Near the city of Rockford, Illinois, lived, and still lives, a prosperous farmer, with fertile acres and money in the bank. Schweinfurth made known to him that his farm had been selected as heaven, and the patriarchal man, honored by his neighbors, and esteemed as a man of good judgment, handed over the farm, and Schweinfurth made it his abode. He was no burden, for a time at least. Money came abundantly, and Schweinfurth had an eye for blooded horses and cattle. The large farm house was improved, and the yard became a beautiful lawn, with plenty of willing disciples to tend it, and my old room-mate uncomplainingly performed the most menial services for him whom he esteemed the Christ. I was in college by this time, and when I returned, as I did once or twice, and met my old friend, he was full of arguments from prophecy, and very eager to talk about his new revelation. Nor was he wrong in supposing himself to have grown in grace. He studied his Bible, he prayed and worked, with the devotion of a saint.

But there were others of whom I am not so sure. And I wonder if I can tell what ought to be told in a manner that is fit to print. When the people of Rockford had endured this reversed heaven till their indignation was at the boiling point, they took counsel with the best lawyers, and hailed Schweinfurth into court, and summoned as witnesses two of the young women known in the "heaven" as "angels." These two young

women were present as witnesses, and beside each sat two red-haired children. And the red-haired Schweinfurth sat in the dock.

Before either woman took the stand—this information comes from a member of the jury—the jury had been won over by the modest demeanor, the calmness and simplicity of the two young women. When they took the stand and testified under oath that these four children had no human father, but were conceived by the Holy Ghost, there was nothing to do but to discharge the defendant for lack of evidence. And throughout the ordeal those two young women, cross-questioned by the ablest lawyers, told their story simply, calmly, unblushingly, and with every appearance of serene modesty.

One of these young women was the daughter of the man who had furnished the farm, and who still was the devoted follower of Schweinfurth. Some acquaintances of mine about this time drove over to the "heaven." They entered the yard, but were met by some one who told them that as the reporters had circulated so many false rumors, no one was to be admitted but disciples of Schweinfurth. However, there was no objection to their staying a while. Jesus Christ was soon to go for a drive, and they might see him. Soon an elegant carriage drove up, and while it waited the good old man, previous owner of the farm, came down and stood by the carriage. The visitors knew him, and approached and entered into conversation with him. In answer to their inquiries he said in substance, "Do you see this house and these grounds, how much more beautiful they are than they were? By so much and more are our lives better and more beautiful than they were before." Then Schweinfurth came down, and the visitors stood back; but the patriarchal old man bowed himself almost to the earth and in their presence addressed Schweinfurth as Jesus Christ.

So says my friend, with whom I have talked within twenty-four hours, for I have just returned from a visit to the scenes of this singular delusion.

What to do! The Legislature of Illinois was importuned to do something to rid the State of this pest-spot. But what could it do? There was some attempt at investigation, but what could be proved?

Schweinfurth, content with the easy life he was leading, did not seek very actively to extend his religion. He showed, I judge, less energy than Mrs. Beekman, and his tastes, I take it, were of another order. To what dimensions might not the religion have grown had he stirred up some genuine persecution?

But at length popular indignation rose to a point where it was resolved to find a way, or make one. Just what would have been done I do not know. But a panic seized the pseudo-heaven. Schweinfurth hastily married his chief angel; the daughter of his host married one of his disciples. I have never been able to learn in what terms he confessed; whether he professed to have been deceived, or admitted that he had been a deceiver. Suddenly the whole thing collapsed. The followers of Schweinfurth scattered, and the old farmer continued to keep him, no longer as believing him the Christ, but perhaps for reasons which he himself could hardly have defined. Schweinfurth became a Christian Scientist, but I have heard that some of the followers of Mrs. Eddy were not proud of his accession, and that he had met with no very warm welcome. This last summer the local Chautauqua assembly of Rockford drew him out, and he and his wife were frequent attendants, and passed in and out of the grounds, listening to

the lectures and attracting no attention. Mr. Schweinfurth is now an ordinary man, of rather mediocre ability. His occupation is gone.

And what about his followers? Some of them sat down, astounded and dumb. The revelations amazed them. Could they ever trust any one again? Could they henceforth believe their Bible? Their Lord had been taken away, and how could they now believe in a Christ? So some of them floated about, derelicts, wrecks in spirit, and almost in mind, pathetic figures, without God or hope in the world. But most of them thought better of it. They had been deceived by a bad man and estranged from their churches, but they came back again into the churches they had left, and life flows on.

Out in Byron, where I visited yesterday, is the unhonored grave of an ambitious and rather brilliant woman, whose vanity led her and others astray. As for Schweinfurth—who cares what has become of Schweinfurth? There are other new religions to the fore, and others yet to come, for the good and gullible are not divided as the sheep from the goats. Be ready, good people who listen, for cries of Lo here and Lo there! There will be other opportunities. The king is dead; long live the king!

OAK PARK, ILLINOIS

Two Ways Diverse

BY MARION FLOWER HARMON

My neighbor's daughter weds to-day;
Lo, radiant guests in fair array
Group round the bloom-decked altar, where
In reverence kneel the bridal pair.

(My daughter lies beneath the sod;
The flowers she loved—the golden-rod
And lily—twine about the spot;
She heeds them not, she heeds them not.)

My neighbor's son stands at her side,
In youthful manhood's strength and pride,
Glad with the might of sturdy arm
To comfort and to shield from harm.

(My son is in his quiet grave;
There pansies nod and rose-buds wave—
His favorites in the long ago;
He does not know, he does not know.)

My neighbor sheltered rests at home,
Her sure retreat though wide she roam;
(I sit beside a stranger's board,
In what chance cheer such may afford.)

Two ways diverse; yet over each
The same blue heavens shining reach;
Though hers the joy, mine grief instead,
God is not dead; God is not dead.

OSHKOSH, WIS.

The Chaos in English Politics

BY JUSTIN M'CARTHY

WE have now at last got a reconstructed Ministry, but the work of construction has been so curiously done that it looks to the outer observer like something only intended to prepare for the further work of destruction. There is, indeed, a certain interest of curiosity attaching to many of the appointments, because the question commonly asked about some of the newly installed Ministers was simply: "Who on earth are they?" No doubt the Prime Minister may have had the best reason for believing that each of his new nominees possesses all the needful capacity to become a great and a practical statesman, but then we, the outsiders, who have no means of knowing anything on the subject, may be excused if we entertain our doubts as to the wisdom of the appointments.

Of course, where we know actually nothing about the qualifications of the men now appointed for the first time, it might be fair enough for the Prime Minister to tell us that we ought to have some confidence in his judgment and his foresight, and to believe that he would not have invited men to enter his administration if he had not good reason to know that they were well qualified to do the work with benefit to the state. But, then, it unfortunately happens that in this work of reconstruction some men already holding office have been trans-

ferred to other places, men who have already given the most convincing proof of their inaptitude for the control of an administrative department.

Mr. St. John Brodrick, who has now been appointed Secretary of State for India, had been serving the country during a momentous time as Secretary of State for War, and is responsible for the amaz-

ing muddles, mishaps, mistakes and misfortunes which befel our military administration during the South African campaigns. The most devoted admirer, the most sanguine friend of the present Government could hardly pretend to say that he sees much hope for the administration of India under the influence of such a statesman.

Some other changes of office have also called up much hostile criticism. Mr. Chamberlain, for instance, son of Joseph Chamber-

AUSTEN CHAMBERLAIN, M. P.

lain, has been created Chancellor of the Exchequer, and thus entrusted with one of the most responsible and important offices belonging to the State, an office for which, so far as the outer world can know, he has never had any manner of training or preparation. I certainly am not able to form any judgment as to Mr. Austen Chamberlain's capacity for dealing with the financial concerns of the Empire, but I cannot help thinking that some of the newspapers have been rather premature in their utterly scornful comments on this appoint-

ment. Much has been said, for example, about Austen Chamberlain's youth, but then the new Chancellor of the Exchequer is forty years of age, and I think English history records the names of men much younger than this who showed themselves capable of managing the fiscal business of the state. My own impressions of Austen Chamberlain are that he is a man of decided capacity and promise. He has had a high education and he must have learned something at least of official work during his service as Postmaster-General. I used to meet him rather frequently at one time, and he then always impressed me as a young man endowed with much intellectual power, mental energy, and a quick sense of humor. Of this latter quality in him I may be allowed to mention an amusing instance which came under my own observation. While I was still a member of the House of Commons, Austen Chamberlain held the position of a Whip to one of the great political parties in the House. The office of a Whip is mainly, as most of my American readers may know, the looking after and arranging for divisions in the House and obtaining pairs for members of the party who, desirous to leave the House before a division comes on, are anxious to enter into agreement with members of the opposite party actuated by a like desire, so that the relative proportions of the division may not be affected in any way. Austen Chamberlain was on this occasion endeavoring to arrange for some pairs, and he came up to me in one of the inner lobbies of the House and asked me if I wanted to enter into such an arrangement. I told him that I had no purpose of the kind and that the members of the

Irish National Party did not allow themselves the luxury of pairing. While we were talking a member of the Government, a man of distinction and then at the head of the Education Department, happened to come up and Austen Chamberlain asked him whether he wished to have a pair. The Minister thus addressed gave his answer in quick colloquial phrase, and, in defiance of grammatical rules, replied, "Not me." "Not I, would be grammatical," Austen Chamberlain promptly said, with a smile, "and observe, Mr. McCarthy, that this is the Minister of Education!" Now I do not

narrate this anecdote as throwing any light in Mr. Austen Chamberlain's capacity for the work of state finance, but it came up to my memory and I thought it worth the telling. All that I can say about Mr. Austen Chamberlain's recent appointment is that he at all events has not proved his incapacity for such a place and that we may do Mr. Balfour the credit of assuming that he had some good reason for believing in the financial skill of the new Chancellor of

LEONARD COURTNEY

the Exchequer. I need hardly say that I am not a partisan of Mr. Joseph Chamberlain, but I am well inclined to hope that his son may prove himself equal to the work of the great position to which he has been thus suddenly raised.

The condition of the "reconstructed" Government is, however, one which seems to me beyond the power of another Pitt to maintain for long. Some of the ablest leaders of the Conservative Party are strongly opposed to the financial policy proclaimed by Joseph Chamberlain and now adopted by Mr. Balfour. Lord Goschen, Sir Michael Hicks-Beach and

Mr. Ritchie—each of these three was in his turn Chancellor of the Exchequer—have proclaimed themselves uncompromising opponents of the new policy, and two of them resigned office rather than have anything to do with a Ministry which accepts or tolerates it. The Duke of Devonshire, who has also resigned office, was, because of his territorial and social influence, his cool, solid judgment and his absolute integrity, one of the most important members of the administration which he sustained so long and from which he has now withdrawn. The Duke of Devonshire is certainly not a brilliant orator or a cultured scholar, or an expert manager of constituencies, but he is clear-headed, solid and strong, and his name carries weight with all sections of the Conservative Party. Then, again, the reappearance of Lord Rosebery in political life must bode fresh and serious trouble for Mr. Balfour's "reconstructed" administration. Lord Rosebery is one of the most brilliant speakers and one of the most fascinating influences in English public life. The country never knows quite where to have him, it must be admitted, and for some time it did not seem by any means certain whether he was likely to patronize Mr. Chamberlain or to return to his old position as a Liberal leader. It has been said of him, and with some show of justice, that he is too clever by half, and it has sometimes seemed even to his admirers as if he were occasionally willing to damage a great measure for the sake of sending forth a sparkling rhetorical paradox. The fatal gift of the amateur makes itself evident in him. He is an amateur of literature,

an amateur of pictures, an amateur of yachting, of travel, and also of politics, but to be a really great political power a man must have a rather more decisive and absorbing taste for political work. Still there can be no doubt that if Lord Rosebery makes up his mind to devote himself even for the time to the business of politics he must be, for the time at least, a power which his opponents would have to take into their most serious consideration. He has now once again presented himself to the country as a Liberal leader and men are already beginning to regard his latest public appearance as an indication that he is

willing to accept once again the place of Prime Minister in a Liberal Cabinet whenever such a Cabinet has a chance of being constituted. However that may be, it is beyond question that Lord Rosebery's latest profession of faith brings a new and a most serious difficulty into the troubled and darkling way of Mr. Arthur Balfour and his colleagues. So perplexed and chaotic a condition of English political life has not excited the curious

WILLIAM WATSON

wonder of the world before during my recollection of parliamentary events.

Meanwhile the readers of books here have some other subjects to talk about as well as Joseph Chamberlain's campaign and the troubles of Mr. Balfour's administration. John Morley's "Life of Gladstone" is just now almost dividing public attention with the distractions of the Ministry. This great work has already had a sale almost unexampled among costly literary productions for many years past. I am not about to attempt to review Mr. Morley's book in these columns, and, indeed, have not yet

been able to make much progress in the reading of it, for John Morley is not a writer who wastes his words, or whose pages can be lightly skimmed, and I am not a man who has leisure enough to devote whole successive days to the pleasure of reading. I only note the publication of the book as one of the distinguishing events of our time, and it will be as much of an event for American as for English readers. One especial quality which it possesses, as I can even already see, is the fact that it includes such a mass of material supplied by Gladstone's own memoranda, diaries and private records of the influence wrought upon him by passing events and by men with whom he was brought into companionship. John Morley has already done successful and splendid biographical work, quite enough to win for him a fame in this department of literature. He has written of Edmund Burke, of Voltaire, of Rousseau, and of Richard Cobden with a style and a completeness which must make these books a part of the study of all intelligent readers during the coming generations. It seems to me, however, not too much to hope that this "Life of Gladstone" may give John Morley the biographer a still higher claim to an enduring fame. John Morley the statesman has already done much good work, but I hope that out of the present chaos of English politics his influence may yet accomplish a still higher task in the revival of the Liberal Party and its restoration to the leadership of England's political progress.

There are two other books quite lately published which seem to me to have a strong claim on the attention of the reading world, even amid all the distractions of political strife. One of these is the novel called "The Yellow Van," by my old friend, Richard Whiteing, the first novel he has published since the splendid

success of his "No Five John Street." "The Yellow Van" appeared originally as a serial story in a magazine, but I deliberately refused to read it in that form, as I have a strong objection to the perusal at far-separated intervals of the installments of a story by one who can command my deepest interest. So far as I have yet made my way with "The Yellow Van" I am inclined to believe that it will, if I may use such an ignoble form of metaphor, actually drive beyond "No Five John Street."

The other recently published book of which I have to make mention is a volume of poems by William Watson. It bears the title "For England," with the added words, "Poems Written During Estrangement." The melancholy meaning of these words will be easily understood by those who know how entirely out of sympathy this gifted and true poet was with the great majority of his countrymen as to the policy which led to the late war in South Africa and the annexation of the two South African Republics. The volume is dedicated to Leonard Courtney, one of the most distinguished Englishmen living, a man who lost his seat in the House of Commons, where he was rapidly rising to a leader's place, because he resolutely and consistently opposed the plans of Mr. Chamberlain and the late Cecil Rhodes, which brought about the war and the annexation. William Watson's poems in this volume sound like the passionate pleadings of one who would save some loved being from a path of danger and of shame. They thrill with the feeling which tells that the more the poet loves his native land the more he is compelled to utter his cry of warning and of protest against the policy of mere conquest and annexation and plunder and the extinction of national independence.

LONDON, ENGLAND.

The Inexpensive Cottage

BY JOY WHEELER DOW

[Mr. Dow is an architect who has been interested in and has made a special study of inexpensive cottages. He has concerned himself with the problems signified by them. Greylingham, which is illustrated herewith and to which reference is made in the text, was erected by Mr. Dow for himself at the beginning of his architectural career. Mr. Dow has in recent years been an extensive contributor to the leading magazines on architectural themes.—EDITOR.]

THE editor has requested me to send him a paper about an article which, during the last ten years, has rapidly become extinct in practice—the *inexpensive cottage*. This has come about through an unprecedented advance in the price of all building material, and a corresponding reduction in the number of hours which constitute the mechanics' working day. Ten years ago it was quite possible to build an artistic and, at the same time, inexpensive cottage, suitable to live in both winter and summer, of which opportunity, however, our immediate predecessors seem rarely to have availed themselves, judging from the very great number of cottages already built and still quite modern that nobody cares to buy, however inviting the price. Somehow these cottages are never exactly what

the discriminating party looking for an inexpensive cottage calls "artistic," nor are they ever planned exactly to suit him, nor yet situated exactly as he could wish. So in order to meet his particular requirements, it has come to be that every man in search of a cottage for his own occupancy is naturally desirous of erecting one after his own heart. Moreover, there never was a sport invented more enjoyable than this seductive avocation, unless it was, indeed, those inexpensive cottages we used to plan and erect with blocks when we were children, where the proposition involved only interesting difficulties, and the serious elements of strain and anxiety, very apt to mar the pleasure of building a cottage, were conspicuous by their absence. For in the actual problem, to-day, no archi-

Greylingham, 1886. (From Architect's Photograph)

Princessgate (Rear View)

tectural undertaking, neither cathedrals nor viaducts, nor even those omnipresent monuments to human greed, the "skyscrapers," can begin to equal the inexpensive cottage in the patience-trying minutæ of its economy.

Even in the halcyon days when the framing timber for the cottage could be had for \$11 per thousand feet, and the bricks for the chimneys at \$6 per thousand; when clear white pine was the staple commodity of every lumber yard, and went without the saying in the humblest edifice; when the workmen managed to be on hand at half past seven in the morning, and did not stop working—except for dinner—until half past five, and no trusts controlled the price of glass for the windows—even then the average man who wanted to build a cottage was apt to expect a good deal more cottage than his money would pay for. Conceive the difficulties of the present day architects to please when the buying power of \$1,000 in the building market has fallen from par to 60!

In the matter of a man's holiday—his vacation—he does not mind very much if he has eventually to multiply all the expenses he has set down beforehand by the figure 2. He likes to joke about it; but with the home he builds the all-per-

vading spirit of American commercialism urges that it is a pure matter of business; the cottage should be a paying financial investment, and altho it unvaryingly works out that a cottage is scarcely as negotiable as a Government bond, one builds with an eye to the main chance of selling at a fair profit, subject only to the American's proverbial migratory inclinations.

Again, the plan of an up to date cottage outside of its architectural excellence is a veritable puzzle in economical geometry, which, like all puzzles, the directions say, must be worked out without the slightest forcing—or, in the case of the cottage—a single makeshift.

Under such circumstances as these, is it not a wonder that cottages continue to be erected at all? Do not such circumstances put a premium on any makeshifts, instead of cottages, that can be made to house the homeless? Well, this would be the situation, indeed, were it not for another element that has recently come to modify it—namely, modern cultivation. The cultivated American of to-day is acted upon by certain moral forces, gaining additional momentum with every year of progress, which are beginning to curb the drastic doctrine of American commercialism, that has always been to make

Pirsson Cottage, Wyoming, New Jersey

every sort of building erected a financial success, even to churches. Simultaneously, at the beginning of a new century, occur to us two strange thoughts. Should we not raise the two words, "church" and "home," out of the sordid passion for making them pay in dollars and cents? And just here indeed is what makes a man more and more determined to rear his home a concrete embodiment of all the significance therein contained, in spite of the commercial argument. He finds he "cannot live by bread alone." Esthetic and traditional considerations form a goodly portion of his daily needs. And if the inexpensive cottage a man contemplates erecting is going to be the supreme effort of his life, and if it looks to be, and is, perfectly proper, nay, desirable, that it should be so, then why not charge a certain percentage of the cost to the same kind of expense account he charges his children's education—take some good architectural advice, and build the inexpensive cottage right? Tho in the matter of a few more dollars and cents, he cannot consider his cottage inexpensive at all. The Americans would be the last people upon earth to advocate mean education; yet the every day object lesson that is going to have more influence upon their children's lives than all the things

they learn at school has been commonly made as meretricious as Yankee ingenuity can devise. It could not exceed in cost a certain ratio to its earning capacity—a purely meretricious theory applied to the Anglo-Saxon home; the theory which we shall have to be rid of absolutely before we may hope to do much toward the improvement of domestic architecture, notwithstanding the huge output of literature upon the subject, which, I regret to say, is nearly all subsidized by the spirit of mammon ever seeking, it is true, to conciliate art. It may be an attractive chimera, I will admit, but, unfortunately, we may not serve two masters.

In the nomenclature of commercialism, I am bound to say that none of the cottages herewith illustrated are inexpensive cottages, comparatively, altho they may appear so, and were I so disposed, I could easily argue, and you would really believe, for you would earnestly want to believe me. You would like to be told, I have no doubt, that the Mitchell cottage at East Orange, for instance, illustrated on page 2628, of which you may have become already enamored as a pretty cottage only can affect you, could be duplicated for the inconsiderable sum of \$3,000. For at this figure, it would pay handsomely upon the investment. I

should say about 10 per cent. gross, which was the old American rate for real estate during the boom times following the Civil War. (See Reign of Terror in a series of papers on American Renaissance in *The Architects' and Builders' Magazine* for June.) But I am going to ask a favor. Please dismiss from your mind, hypothetically at least, the theory that a man wants to make his house pay numerically as the principal or even a remote desideratum. Suppose, for the nonce, he correctly thinks that all the pedagogs in the land cannot overcome the influence of one piece of ugly architecture upon the mind of his offspring, with which it is in daily association, and that all the green trees in the country cannot make beautiful that which has bartered its birthright to commercialism. Suppose him to be conscious of how much environment has to do with his own happiness. Ah! There a very different consideration confronts you, does it not? Resolved into a single question, or, to be strictly accurate, two single questions, the matter would stand thus: Multiplying what one thinks it should cost by 2, what would it cost, actually, at the present time, to build one's self a properly de-

veloped, historical cottage, significant of the Anglo-Saxon home, but pre-eminently of it in America; such a cottage, let us say, as the one in East Orange, architecturally; and, secondly, have I the means?

I think there are evidences that commercialism in its more aggravated form is dying out among the better class of Americans, who are growing to be—well, ashamed of it, is the word—and you may not have to wait so very long, either, before some fortuitous event in your own affairs will come to your aid in meeting a new and more enlightened philosophy. But without the means, you had much better wait a lifetime than go astray, in so important a matter as building a home.

On page 2629 you will have no trouble in recognizing what commercialism thinks is good enough for you, and what you should be willing to accept in lieu of a cottage, the rent from which, should you ever want to rent, would not justify the cost; but if you ever had a mother, a father, brothers or sisters, if you ever had any home life that you like to revere and look back upon, if you respect the memory of your ancestors, if the history of the United States means anything to

Cottage at Maplewood, New Jersey (Rear View)

you, for the sake of goodness don't be diverted from your higher duty to yourself and your descendants. I do not mean to say, upon the other hand, that the illustrations I have selected for this thesis represent cottages so expensive as to be prohibitory to people in moderate circumstances. They are not. But if any one tells you, to-day, that you can build a house suitable for all the year round occupancy, containing a living room, a dining room, a kitchen, an entry, about four bedrooms upstairs, all of a

quoted as a minimum. And it is not that the better class of cottage habitually costs more than does commercial ugliness and tawdriness. Commercialism, like all folks in their dotage, is often imposed upon by its pets, when even its own designs and handiwork prove failures in the rate per cent. theory. There is such a thing as being too meretricious in architecture. The reader may recall several cases within his own knowledge where commercialism has come to grief in its own specialty of financial cupidity;

The Mitchell Cottage at East Orange, New Jersey

decent size, adequate plumbing and heating appliances, a suitable cellar and double floors, the whole properly designed and properly finished, for much less than \$4,000, he either deceives you or is trying to deceive you.

It is not necessary to build your ideal cottage entirely of stone, after the manner of Princessgate or Greylingham (see pages 2625 and 2624.) I submit two other cottages with which I do not imagine you will find a great deal of fault, constructed differently, but both wooden construction, barring the foundations. Yet even the tiny Pirsson cottage (page 2626) could not be reproduced at the present time for less than the figure I have

and with these cases in view, it may be you can truthfully aver, all things considered, that in the design carried out as it demanded to be, in spite of commercial axioms to the contrary, you have achieved the inexpensive cottage.

But the plea I make herein is not to that end. It is a plea for the percentage of your capital you should be willing to invest in art for art's sake; for its influences upon your own life, and the lives of those who are to come after you. If you had \$5,000 to invest in a painting, I am sure you would not attend a promiscuous auction sale of the gaudy things one passes in one's walks about town; no, indeed, you would not. You would con-

sult only experts. You would be willing to pay a commission commensurate with the importance of the investment and the lifelong skill of the connoisseur. You would take every precaution, not that the picture should be a great bargain, or that it could be sold again for much more than you paid for it, but that it should be an acknowl-

What Commercialism Thinks is Good Enough for You

edged work of art by the highest authorities in America; so, at least, it would be accepted by the Metropolitan Museum if donated thereto by a codicil of your will. Now all this about a picture, mind you. What solicitude and conscientious pains, entirely beyond the financial consideration, should you bestow upon your home!

WYOMING, N. J.

France in the Orient

BY CHARLES DENBY

FORMERLY UNITED STATES MINISTER TO CHINA

ALL the world loves a Frenchman. His gayety, his *insouciance*, his comradeship are catching. He is the best companion in the world, the prince of good fellows, gallant, brave and polite. The "overseas" people, whether on this continent, or in Africa or Asia, have always loved him. But his good qualities themselves work against him in colonizing. He is not serious enough. He is not domestic enough. He has too many functionaries. Henry Norman, in his book on the East, tells us that in Tonquin the population is 1,800,000 souls. The French population is 1,600 inhabitants, of whom 1,200 are functionaries. He tells us, also, that in 1887 the salaries of the functionaries amounted to £360,000, and the amount expended on public works was £16,000. Evidently this is bad financiering.

The French possessions in the Far East comprise Annam, Tonquin, Cambodia and Cochin-China. The three former are under French protection; the last is a French colony. Annam is bounded on the east by the Gulf of Tonquin and the China Sea, on the west by Siam, Cambodia and the Shan States, on the north by the Chinese provinces of Yunnan and Kwangsi, and on the south by Cochin-China. Hue, the capital of Annam, is

situated on a small river named Truong Tien, and called by the French the Hue River.

Tonquin was anciently an independent kingdom, but in 1802 it became a province of Annam, and by the treaty of Hue, dated June 6, 1884, it was placed by the Annamite Government under a French protectorate. Hanoi is the capital.

Cochin-China is a French colony. The Province of Giadinh, of which Saigon is the chief port, was conquered by the Franco-Spanish fleet the 17th of February, 1859. Lower Cochin-China was occupied in 1862.

Cambodia is a monarchy under French protection. A treaty was signed in June, 1884, by which the country was handed over to French protection. The capital of Cambodia is the city of Phnom-Penh, which is situated on the Mekong.

It will always be a question whether France derives any real benefit from its eastern possessions. In the Chamber of Deputies this question is discussed with a great deal of animation whenever the budget is presented, because there are always embodied in it appropriations of many millions of francs to meet the expenses of these possessions. They have never paid their way, and it is safe to say they never will.

In none of the countries above mentioned can the white man labor in the field, and the white population is confined to functionaries and the few merchants who supply them with luxuries.

France pays \$30,000 per annum to an operatic company which sings at Saigon during the winter months and returns home in the spring. The writer made a trip once with this troupe from Saigon to Marseilles, and the ship's company had opera and vaudeville every night.

It is generally conceded that as a colonizer France falls behind England, Russia and Germany. No doubt Russia has conceived the proper idea of colonization. Her course is toward the rising sun, but she avoids the tropics and keeps within the white man's country. While the rest of the world is looking to Africa, she seeks Northern Asia for exploitation, and her method is to fill the country up with agriculturists. She has seized Manchuria, with its splendid climate, its mines and forests, and she leaves the tropics to the "get rich quick" people. Of all the nations she knows best how to rule captured countries. She is terribly severe when an insurrection occurs, and slaughters thousands, and when the trouble is over her officials are kind, gentle and insinuating. She rarely has more than one trouble with the races that she has overrun.

German colonization is not thorough. Political allegiance goes with it. Red tape prevails in the colonies as it does at home, and the interests of the old country are held to be supreme.

There are several reasons why the jovial, genial Frenchman fails as a colonizer. He does not take a wife, or family, with him to the colonies. In Canada he was simply a *coureur de bois*. In Cochin-China he takes a housekeeper, who has charge of his household and who remains with him until he leaves the country.

He loves France, and will stay at home until driven abroad by want. Estates are equally divided among the children of a family in France, so that there is always something coming to every member. He never goes abroad intending to remain, but always looks forward to returning to France when he has laid up some money.

There is no superabundant population in France as there is in Russia, Eng-

land and Germany. Statistics show that the population is decreasing. Financially, too, France is falling off. Her tariff policies in the Far East are bad, but even with their aid she barely holds her own in trade and commerce with England.

While individual Englishmen do not assimilate with the people whom they dominate, still in her national conduct England sets the world an example of fairness and open, honest competition. In the Far East her ports are open to all the world. Her flag means civil and religious freedom. With her material business go the English church, the club, and the schoolhouse. Hongkong is the commercial center of the Far East. It is the *entre-pot* of the trade of the East to which all maritime lines go, which receives goods destined to China from the West, and to Europe and America from China. It is a free port, and keeps no statistics of trade whatever. France has no city of the kind to rival it, and never will have. Her trade with China is insignificant. Her maritime lines, which are very excellent, are subsidized by the state. She has no people to colonize with, and no trade by which to support them. Take it all in all, her alliance with Russia hampers her. She must follow the lead of the Autocrat wherever it points. She indulges in an incurable jealousy of England. In China the keynote of her action has been to annoy England. Antagonism to her is currying Russian favor. France mixes up politics in all industrial movements, and it matters little where a railroad runs so it taps English trade. If, as France seems to believe to-day, colonization of other lands is to restore prosperity to her, she must learn the lessons taught by her English rival. When her young men go abroad they must take wives with them, and build up homes. She must cease to strangle trade. She must open her ports to the commerce of the world on equal terms. It is quite certain that as long as colonies mean only increase of home taxation, the holding of them cannot be considered as permanent. The test, at last, will be, Does the colonial policy pay? and when that is decided in the negative the rule of France over Indo-China will cease, and England will step in again to teach her how to build up empires.

EVANSVILLE, IND.

How Chopin Wrote His "Funeral March"

BY FÉLIX ZIEM

[On the heights of Montmartre, Paris, not far from the recently constructed Church of the Sacre Cœur, and now almost blocked in on all sides by building, there stands a curious old ruin, untouched by any other hand than that of Time, whose rust is slowly spreading thicker and thicker over its walls. It is here that Félix Ziem, the great impressionist artist, whose talent Theophile Gautier in a few of his exquisite pages has so well characterized, still paints his famous Venetian scenes, though in his eighty-second year. For fifty years he has sheltered his household gods in this same home; and here, when in Paris, he has always lived alone—having never married—surrounded by his own creations and the treasures he has amassed during his long artistic career, these latter, a vast medley of curiosities of all kinds, collected or acquired in almost every part of the world.—EDITOR.]

AS a young man I traveled a great deal. It was on one of my art-pilgrimages, and after I had been staying for some time at the Russian court, that I met Chopin first, in a place much nearer to his own country than to Paris. The common friend who introduced us to each other was the Count Xavier de Maistre. Afterward, Chopin and I became intimate, enough so for him to take an interest in my painting and for me to become enthusiastic about his music. Even at that date—I was only about twenty-five and he twenty-seven—I quite recognized his genius. I can see him now—not at all like the portraits shown me, but still a fine looking man—often silent, reserved and melancholy when we were merry and talkative; his was a nature apart, very different from other celebrated musicians I knew,—Liszt, Rossini, Paganini, the last of whom taught me what little I was ever able to play on the violin. Yes, Chopin was a great master of music. I am no critic. But I know what good music is.

It was not in my present studio that his wonderful "Funeral March" was composed. I was then (about 1840, I think it was) established in another, a more Bohemian work-shop, if possible, than this one, situated in the Rue de

FÉLIX ZIEM.

Bréda, No. 31. As I used it for the threefold purpose of painting, eating and sleeping in, I had divided it into three compartments by means of tapestry hangings descending from roof to floor. The middle compartment was more properly my studio. In it were all my artist paraphernalia, including a human skeleton, which I used for draping in various attitudes. Of the furniture there were two articles that helped to constitute the scene I am about to relate—the one a large divan, standing against the tapestry of my sleeping compartment, the other a piano, which I had bought cheap from a second-hand dealer and from which I had sawn out the panels in order to paint pictures on them. One of these is still in the possession of a friend of mine, Marcotte.

It happened that on the day which has since become historic I had invited a friend or two to dine with me. After the meal some other friends had joined us in the studio. I may mention Chevandier de Valdrôme, Ludre, de Polignac, the musician; Chopin, and Ricard, who had painted my portrait. We were a gay party and prolonged our "*causerie*" into the small hours of the morning. It must have been about two o'clock, I think, when, being for a moment alone

with Ricard in the middle compartment—the others were in the sleeping room beyond the divan—I seized the skeleton on the suggestion of some mad fancy passing through my head, and, shrouding it in the piano cover, which Ricard obligingly whipped off for me, I raised the tapestry and made it jig before our friends on the further side.

At first they saw only the comic of the situation. Their previous merriment grew louder and

reached its maximum when de Polignac stalked forward, took the skeleton from me, insinuated himself beneath the shroud, and, sitting down at the piano, made the bony fingers of the puppet play. It was a weird spectacle. All of us were fascinated by the grim humor of this skeleton man performing on what, with some truth, might be called a skeleton instrument, its naked hammers looking like so many teeth moving within a skull. We began to affect or to feel a sort of fright, for which rhythmic taps on the divan, secretly administered by one of the company, were partly respon-

CHOPIN

sible. There were repeated Oh! ohs! one, at last, more energetic than the rest, proceeding from Chopin. We looked at him. Moved by a sudden inspiration, he advanced toward de Polignac, seized the skeleton in his turn, and displacing the performer, himself sat down on the stool. The first chords that he struck were with the skeleton on his knees; but, warming to his theme, he let it clatter to the ground. A deep silence fell on us.

It was the "Funeral March" he was playing. There is no need for me to enlarge on the applause that greeted Chopin at its conclusion. We knew and he knew that he had composed a masterpiece. Before going to bed he spent four hours in putting onto paper his new creation. It is possible he may have added to his improvisation some chords, some few bars even that rendered it more complete. But he changed none of its essential features. The music we heard on that memorable night was substantially what is contained in the written notes of to-day.

PARIS, FRANCE,

Literature

Ireland Under English Rule

WE are of the opinion that Dr. Emmet has produced the best and most comprehensive statement of the Irish question that has been issued by the American press.* He is a grandnephew of Robert Emmet, the gifted young Irish revolutionary who was executed in Dublin in 1803, and he might naturally be expected to write strongly and with considerable bias when defending a cause for which several members of his family have suffered; yet we must acknowledge that he has been far more moderate and judicial in tone than other writers on this side of the Atlantic who have pleaded in behalf of Ireland. Heretofore books, pamphlets and editorial articles in violent denunciation of England's course toward Ireland have been issued from sources avowedly partisan, and for that reason have been heavily discounted. Dr. Emmet wished to anticipate that objection, so he brought out these volumes under the *imprimatur* of an old and well known publishing house, and has stated the case for Ireland with ability and a conscientious desire to be as just to England as the facts would allow.

It will soon be evident to the reader that the author found little reason to credit the British Government with just intentions; and he brings forward damaging evidence in support of his position. With a large part of his arraignment of the British Government the historian Lecky, who certainly will not be suspected of a Nationalist bias, agrees; and with other parts, relating to the last twenty years of Irish history, authorities no less eminent than Gladstone, John Morley, Premier Balfour and Sir George Trevelyan are in substantial accord.

There is a certain looseness of phrase which sometimes mars Dr. Emmet's style and suggests that he may not be a safe guide when he leaves general denunciation and deals with particular charges. When he does so, however, he usually

becomes more careful. For example, to say that England never hesitated to violate a pledge when dealing with a weaker Power is untrue; but we are bound to say that, in the case of Ireland, the violation of pledges made by official England has been so frequent that it might well seem to be a habit. The author of these volumes adduces plenty of evidence to support that view. The British Government has been almost faithless to Ireland, and if during the last twenty-five years of the nineteenth century there have been various attempts at reparation, those attempts have been due almost as much to political calculation as to benevolence. The land bill, of course, stands on a different footing. It is the summation and merger of all preceding efforts, and aims to remove by one comprehensive measure the agrarian disaffection which has troubled Ireland for more than seven centuries. Such legislation in effect concedes that England's course with regard to Irish land has been wrong; but does it not also encourage a further concession of home rule in local affairs? Dr. Emmet maintains that it does, and we agree with him that the concession must eventually be granted.

Two Romances from the Western Desert

THOSE who read "The Beleaguered Forest" know that Mrs. Peattie can describe *The Edge of Things*,* or the lonesome wherever she finds it. And in this book she has not failed to interpret the desert scenery, the monotony and madness of life on a remote Colorado sheep ranch. But this is the extent of her literary genius. She writes of men as if each one of them had a female heart for suffering in his flat man bosom. And the effect is often absurdly frivolous when she intends it to be quite the opposite. This comes from what may be termed the

* IRELAND UNDER ENGLISH RULE. *A Plea for the Plaintiff.* By Thomas Addis Emmet. In two volumes. New York: G. P. Putnam's Sons. \$5.00.

* THE EDGE OF THINGS. By Elia W. Peattie. New York: Fleming H. Revell Co. \$1.25.

coquettish imagination. Such a writer has feminine limitations in literature, and she should confine her art to the interpreting of lovely women in the wilds of nature. The two harmonize very well, as she proved in her earlier novel.

This, however, is not her only limitation as a literary artist. Apparently she has about the same idea of constructing a romance that an elderly lady has of piecing together a crazy quilt. The story opens with a very gawky chapter about two college boys who swear like girls, and it is written in a style strikingly different from the remainder of the book. Besides, there is another chapter in the very midst of the tale so irrelevant that it has no bearing whatever upon the progress of events.

But whoever reads *The Edge of Things* should also read Geraldine Bonner's new story, *To-morrow's Tangle*,* by way of making an interesting comparison between the two. Both deal with the same desert scenery, but Miss Bonner shows power where the other shows merely a nervous sensibility to outward impressions. She can not only sum up the desert thus:

"The silence of waste places were upon it. It was gaunt and sterile, clad with a drab growth of sage, flat as a table, with the white scurf of the alkali breaking through its parched skin. It was the earth lean, sapless and marked with disease. A chain of purple hills looked down on its dead level, over which a wagon road passed like a scar across a haggard face,"

but she can match it with a human tragedy as simple and as horrible in its significance, and this proves her greater genius.

One other feature of this remarkable novel should not be overlooked. The flaw in Harry Leon Wilson's recent story of Mormon life, "Lions of the Lord," was that he failed to indicate the effect of the Mormon faith upon the female victims of it; but in the initial chapters of this book we have the destruction of feminine virtue and honor, the outrage to their sacred consciousness, dramatized in a way no one is likely to forget who reads it. The remainder of the story is exceedingly interesting.

"Mariposa," the heroine, belongs to

that class of large, beautiful, good women, without much capacity for self-protection, who have sometimes suffered so helplessly in Thomas Hardy's novels. In our own country they are types peculiar to the West. At least, they are found in the fiction of no other section. We have more than enough of heroines with "length of legs divine," to be sure; but in most of these a neurotic condition interferes with the perfection of the type. Now the beautiful Amazon woman of the West, like "Hilda Tree" in "The Octopus," and Mariposa in this story, has no nerves. She is even a little dull. The elements that attract in her are simplicity, goodness and health. Such women are generally the victims of peculiarly diabolical circumstances, and they do not weather through with the dash and shrewdness of the average virtuous little black-eyed vixen whom we are accustomed to meet hand to hand with fate in novels; but after their own silent, superb manner they survive. Even so Mariposa wins through with that sane unconsciousness of a large nature that keeps no register of life's sorrows, but grows and whitens into greater beauty upon the soil of tribulations. The title of the story is infelicitous and much too small for it, but it is written and conceived in a manner that deserves to attract attention.

Old Quebec

IF the spirit of old romance may be said to linger anywhere in the New World, it is certainly in Quebec, around which the memories of saint and warrior gather as nowhere else in America. The subject is an admirable one for the historian—especially an historian trained in the romantic school of fiction—and for artist alike, as the present volume* makes evident. It begins with the coming of Cartier in 1535, when only the Algonquin eyrie, called Stadaconé, crowned the precipice above the river. Cartier, however, sailed up St. Lawrence to Hochelaga and left the actual founding of Quebec to Champlain, who started the log buildings of "L'Habitation," in 1608, on the narrow wooded strand beneath the perch of Stadaconé, which by this time

* TO-MORROW'S TANGLE. By Geraldine Bonner. Indianapolis: The Bobbs-Merrill Co. \$1.50.

* OLD QUEBEC. By Gilbert Parker and Claude G. Bryan. Illustrated. New York: The Macmillan Co. \$3.75 net.

had been devastated by the terrible Iroquois.

From that date to the famous battle on the Heights of Abraham, when Wolfe and Montcalm both fell, there is a succession of interesting events and personalities. These are the *coureurs de bois*, who made Quebec their headquarters—often the descendants of the old French nobility, who took to this wild, lawless forest life as a compromise between the necessity of earning bread and their aristocratic contempt of work. There are the Jesuit missionaries, Brébeuf, Lalement, Garnier, Jogues and others, whose religious enthusiasm, joined with their far outreaching imagination, cannot be left out of count when the forces are reckoned up that made the literature and civilization under *Le grand Monarque*. There are the great warriors, such as the indomitable Frontenac—indomitable except to his wife, whose tongue drove him over the waters, if we may believe Saint Simon; altho another report explains his departure by a ditty which became too popular in the Louvre:

“Je suis ravi que le roi, notre sire,
Aime la Montespan;
Moi, Frontenac, je me creve de
rire,
Sachant ce qui lui pend”—

and the rest, which is better unquoted. There are the famous Ursuline nuns brought over by Madame de la Peltrie, and many other persons and events which may be read about for the most part in Parkman, but are here brought together in a single volume.

This old French life, transported to the wilderness of the New World, is indeed one of the most striking episodes of history and makes good reading.

Place and Power. By Ellen Thorneycroft Fowler. New York: D. Appleton & Co., \$1.50.

As a rule the religious novel is written by a person who has the pious mind, un-

enlightened by humor or the real truth of things. There is a theological erectness about the hero or heroine which renders them more or less forbidding. Apparently the author creates them according to certain creeds and doctrines,—all of which does credit to his good intentions, but proves him a sorry artist. Human nature in its Sunday blacks may

MAJOR GENERAL JAMES WOLFE

(From a scarce contemporary print)

not be posing, but it certainly is straining, and does not deserve more than one chapter out of every seven in the story. But if Miss Fowler has the ecclesiastic imagination, she also has the saving grace of humor. Probably the wittiest lady in this year's fiction is Ellen St. Just, one of the incidental characters in this novel. And the more important actors in the drama are admirably drawn, as full of frailties and virtues as average men and women. This is beyond question the author's best novel so far and merits attention.

Warwick Castle and Its Earls from Saxon Times to the Present Day. By the Countess of Warwick. With 2 photographic plates and 172 illustrations. Two vols. New York: E. P. Dutton & Co., \$8.00 net.

The Countess of Warwick, whose picture is here reproduced, has compiled an interesting and in some respects valuable history of Warwick Castle and its masters.

The narrative begins with Ethelfleda, daughter of Alfred the Great, who married Ethelred, Earl of Mercia, and in the year 914 threw up the Warwick mounds; it passes through the tenure of the successive families of Newburgh (the first Norman earls), Beauchamp, Plantagenet, Neville, Dudley, Rich and Greville (the owners of the title to-day), and concludes with the death of the present earl's father in 1893. The history of this long line of earls is thus summed up by the author:

"We meet them in our foreign wars: at Crécy, and Poitiers, and Agincourt, and in Queen Elizabeth's expedition to Havre. They have been even more conspicuous in our civil wars: the wars of Stephen and of Edward II; the wars of the Roses, the rising of Lady Jane Grey, and the war of the Parliament against Charles I. They have been the hosts of kings, and also their executioners. They have dictated the policy of their country, and they have perished miserably on the scaffold. They have been generals in our armies and admirals in our navies; and they have distinguished themselves in other fields of fame. There was once an Earl of Warwick who was a pirate; there was once a pretender to the earldom who distinguished himself by inventing a valuable patent medicine. This history, therefore, will not lack variety."

Nor does it lack interesting literary associations. The Lady Godiva and Peeping Tom are famous in song;

Shakespeare himself was descended from Thurkill, the traitor Saxon earl who failed Harold at the Battle of Hastings; and to mention the Rich family is to call up recollections of Philip Sidney and other great names that belong to letters. Altogether no small part of the history of England revolves about this famous castle.

FRANCES EVELYN WARWICK

The Life of Father Dolling. By Charles E. Osborne. New York: Longmans, Green & Co., \$5.00.

Father Dolling was one of the great religious figures of the Church of England in the latter half of the nineteenth century, and the story of his life only wanted to be fairly well told to be fraught with inspiration as well as interest. His present biographer has been eminently successful in presenting a portrait of him both truthful in the general impression and accurate in details. Mr. Osborne was, indeed, intimately associated with Father Dolling for over twenty years, and thus writes with a first hand knowledge of

his subject. Father Dolling had a singularly many-sided personality, and every side of it appears to have been equally magnetic. An Irish patriot, an English radical, a Christian socialist, somewhat of a Bohemian in the best sense of the word, he gained an influence over the most debased elements in the great English cities not paralleled even by that of the Salvationists. Mr. Osborne's account of his life in his native land is so attractive that we should have liked it a little fuller.* Appointed land agent of several estates at a period of great agrarian excitement, when having a shot at a too pertinacious agent was regarded as an inevitable incident in the play, he went to farmers' meetings unarmed, and even sometimes persuaded the farmers to pay their rents:

"He had been appointed to collect rents at a certain place in Westmeath. The police warned him not to go, but he did. When he arrived he met the tenants in a barn. As soon as he began to speak they made such a noise that he could not be heard, so he quietly took out his pipe, lit it, and began to smoke, saying he advised them to do the same till they were more calm. After a little, when they were more inclined to listen, he spoke to them in his manly, straightforward way, and they all, to a man, came forward and paid their rents."

It was this quality that made him irresistible when chumming with thieves at Landport, or smoking a cutty pipe with soldiers at Portsmouth, or fighting the liquor sellers everywhere.

Arnold's March from Cambridge to Quebec.
A Critical Study. By Justin H. Smith.
New York: G. P. Putnam's Sons, \$2.00 net.

Professor Smith has minutely searched all the available records of Arnold's invasion and has traversed much of the route. A contest with Nature which proved so close and pitiless, the issue of which hung so long in doubt and depended on so many and often such apparently petty circumstances, can be correctly understood, he maintains, only by knowing its particulars thoroughly. To this leading principle of his inquiry he has clung tenaciously, and his work is a marvel of minute investigation and narration. It is interesting to note on how many particulars he disagrees with Mr.

Codman, whose work on the same subject appeared last year. Some of these corrections are doubtless debatable, tho most are valid; but relating, as they generally do, to minutiae, they do not greatly affect the character of the earlier work. Professor Smith's account gives a somewhat less tragic picture of the privations and sufferings in the wilderness than we have grown accustomed to. It depicts graphically the hunger, the sickness, the almost incredible hardships which the army endured; but it gives good ground for believing that the sum of ills suffered has been considerably exaggerated, as also the number of lives lost up to the time of reaching the first settlement on the Chaudière. What that number was the author refuses to guess, satisfying himself with an inconclusive comment on the chronicler Morison's statement that it was "70 or 80."

The Book of the Rose. By Chas. G. D. Roberts. Boston: L. C. Page & Co., \$1.00 net.

If the reader is supposed to take the initial poem of the volume as a sort of matrix for the collection, he will notice from the beginning an incongruity, as it were, of motive running through the whole conception. This opening poem, as far as we can make out, is a dialog of passion in blank verse, interrupted by a lyric or two in similar vein, held on the deck of an ocean-going steamer to the accompaniment of the engine. Now that so much of life goes on to the clank of machinery, the situation may seem natural enough; but the blank verse and the passion are another matter, and this little initial jolt between business and pleasure seems to have worked itself in one way or another into the subsequent imagery and rhythm. We may be easily risible; but to us the following stanza seems in its movement to be tripping dangerously near the edge of the absurd:

"O little rose, O dark rose,
With smouldering petals curled,
I am the wind that comes for you
From the other side of the world."

Of course, this is not fair to Mr. Roberts. We do not pretend that it is. Our serious opinion of his poetry we took pains to express at some length about a year ago,

and we must say frankly that the verse of which this volume is composed is too little like that upon which our opinion was formed—its art is so very business-like and machine-turned, we feel almost justified in saying—that it has little effect upon that opinion one way or the other. And yet we ought not to put the book away without commemorating such occasional lines as these:

"O voice,
Whose sound is as the falling of the rain
On harp-strings strung in casements by the
sea."

The Promotion of the Admiral and Other Sea Comedies. By Morley Roberts. Boston: L. C. Page & Co., \$1.50.

The story which gives a title to the collection is the only one of merit, and as it recounts the "shanghaiing" of a British Admiral into a "hell-afloat" Yankee merchantman, and the revenge he took in consequence thereof, it is original and, in fact, somewhat Homeric. But it is wildly improbable, and the writer's seamanship is unique—especially when he leaves a ship with her topsail yards braced in and clewed down for reefing, in the teeth of a howling gale, while the captain and mate fisticuff for supremacy; and then causes the victor to send the crew (which has laid down from aloft to witness the fray) up again to go through some strange proceeding, not known to the sailor's art, which he describes as "making fast" the topsails.

The Bondage of Ballinger. By Roswell Field. New York: Fleming H. Revell Co., \$1.25.

Mr. Field has here drawn a sympathetic picture of the bibliophile. The book collector that flits through the pages of this charming little volume loved his first editions, his Elzevirs, his Kelmscott and Vale Press publications, his presentation copies, his autographs and pictures and other rare bookish treasures, with a kindling enthusiasm. To those who do not know the joys of collecting the story may have the flavor of caviare, but the book lover must revel in this faithful portrait of his brother in bondage. Dear old Ballinger! He was truly in bondage, but

how sweet it was to him. No one can fully know the joy that lurks in collecting rare books until he has sacrificed his dinner to buy them. Book hunting is provocative of some of the keenest pleasures in the world, even if the true collector is usually improvident as typified in so large a sense by

ROSWELL FIELD

Ballinger. Mr. Field has succeeded in giving a romantic touch to his book in the person of Helen, the millionaire's daughter, who becomes a bibliophile herself under the gentle teachings of Ballinger. The reader rejoices when in his declining years the aged collector is given a post in the section devoted to Americana, first editions and freak books in the Shapleigh Library.

The Yellow Crayon. By E. Phillips Oppenheim. New York: Dodd, Mead & Co., \$1.50.

Another novel by the author of "The Traitors," and written in much the same style. *The Yellow Crayon* is the name of a secret order supposed to exist among the aristocracy of Europe for the purpose of protection against socialists and anarchists. Thus the plot of the tale is involved in mysteries and villainies, which the author multiplies to the point of becoming tedious; but, on the whole, it is an entertaining book, and will doubtless be a popular one.

Texas. A Contest of Civilizations. By Geo. P. Garrison. ("American Commonwealth" Series.) Boston: Houghton, Mifflin & Co., \$1.10 net.

Mr. Garrison has written in a very readable style what he informs us is a "study based on" the history of Texas. He has neglected many tedious details and has dwelt upon the salient features of the experience of the people. Tho, according to the plan of the series, he has given no footnotes or bibliography, yet he has written, he assures us, "under a keen sense of responsibility for every statement." Those who know Mr. Garrison will not doubt this assertion. After a brief general treatment of European expansion in America, the author takes up the first main division of his subject, the history of Texas to the time that it became part of the Mexican empire. He describes with clearness and force the struggle between France and Spain for ownership, the failure of Spanish methods of colonization, and the Anglo-American invasions. The next main division deals with Texas to the time of gaining independence of Mexico. The inevitable colonization from the United States goes on, increased by Austin's colony and the "crowd of Empresarios." Mexican misrule and the resultant insubordination of the colony ends in the struggle for the Constitution of 1824. Santa Anna makes his attempt to destroy the Constitution and re-establish the empire, and the Texans' war of independence results in their victory at San Jacinto. Thus far, except that the slavery issue is slighted, we have the best short treatment that has been written. The rest of the book

seems to have been written under the fear of hurting Southern feelings on the slavery question, and the matters treated are too local in interest and significance to include the most striking and dramatic matter in Texas history. Emphasis is laid upon the conflict between two types of civilization, and the slavery issue is slighted as "a small element in the struggle." The contact with the United States is almost ignored, and very little is made of the great fact of annexation.

Marion Harland's Complete Cook Book. By Marion Harland. Illustrated. Indianapolis: The Bobbs-Merrill Co., \$2.00.

THOSE who learned to appreciate Marion Harland's first cook book, "Common Sense in the Household," published thirty-one years ago, will give her *Complete Cook Book* the welcome it deserves. Experienced housekeepers will find in it much material that is new to them, and hundreds of recipes of new and delicious dishes; while to young housekeepers it will prove a veritable friend in need. The book is intended for the family of average means, not for the millionaire or the *chef*. The arrangement of the book is excellent. All the breakfast dishes are in one group, the lunch and dinner dishes each in a separate group. After each division or subdivision there is a familiar talk on the subject just treated which is very helpful. There are, moreover, suggestions for formal breakfasts, luncheons and dinners, and for afternoon teas. The only adverse criticism we would make is that the ingredients are not written out at the beginning of each recipe; as a result it is necessary to read the recipe through instead of being able to see at a glance what it contains. The book is well printed and attractively illustrated, and has a complete index at the back.

Mors et Victoria. New York: Longmans, Green & Co., \$1.20.

Another closet-drama in blank verse, and very frankly closet-drama, we should suppose, from the changes and variety of the scenes and the elaborate auxiliary description of the scenery, or the pictures (*tableaux*), as the writer likes to call them. The play is laid in the time of

Henry of Navarre and the persecution of the Huguenots, but is really another private love-letter with a historic postmark. It is not, however, without its apparent felicities of language and situation—the scene, for instance, in which Marguerite decides to die with her lover is not without dramatic exhilaration.

Literary Notes

"ILLUSTRATIONS for Sermons," by Clarence Edgar Rice, contains a selection of anecdotes, many of which are suitable for general use as well as for enlivening sermons. (G. P. Putnam's Sons, \$1 net.)

....Three new volumes of the Thackeray edited by Walter Jerrold contain "Catherine, &c.," "Sketches and Travels in London," and "Christmas Books." (The Macmillan Company, \$1 each.)

....The new edition of "Pilgrim's Progress," to be issued by the Oxford University Press, will contain illustrations from drawings made by George Cruikshank and never before published.

....Another of the humorous calendars of Paul Elder & Co. is "Widows: Grave and Otherwise; Purloined by an Ex-Widow and Pictured by a Victim." This quaint little volume contains a quotation for each day of the year, proving, as Dickens says: "Widders are 'ceptions to ev'ry rule." (Price, \$1.00 net.)

....The Robert Clarke Company, of Cincinnati, announce an elaborate Archæological Encyclopædia, "The Stone Age," which will cover the arts of the American aborigines in pre-Columbian times. It is to be written by Warren K. Moorehead, Curator of the Department of American Archæology, Phillips Academy, Andover, who solicits communications from those who have special knowledge on the subject to impart.

....A most elaborate genealogical work is that of the "Five Colonial Families: Treman, Tremaine, Truman, Mack, Dey, Board, Ayres," by Ebenezer Mack Treman and Murray Edward Poole. The work is in two large volumes, illustrated, and comprises a really enormous amount of Colonial family and general history. The work is for sale, at the cost of production, \$20.00, by Murray E. Poole, of Ithaca, N. Y.

....We have already called attention to several volumes ("The Tour of Dr. Syntax," "John Mytton," etc.) of one of the most unique and attractive series published for some time. Four new volumes, like the earlier issues bound in red linen and illustrated with reproductions of the old colored plates, by Thomas Rowlandson, Henry Alken and John Leech, are now be-

fore us: "The Vicar of Wakefield;" "The Dance of Life," a Poem by the author of "Doctor Syntax;" "Jorrocks's Jaunts and Jollities," by R. S. Surtees; and "Handley Cross," by the author of "Mr. Sponge's Sporting Tour." In particular, we commend the last two mentioned books to those not already familiar with the wit and humor of Old Jorrocks and his sporting friends. (D. Appleton & Co., \$1.50 each.)

Pebbles

CANADA will be madder yet when Alfred Austin versifies her wrongs.—*Cleveland Plain Dealer*.

...."I fell very queer in the au—tumn," whispered the tree.—*Yale Record*.

His face is round and rosy,
His cheeks are full of lumps,
His eyes are almost hidden,—
Our Freddie has the mumps.

—*Princeton Tiger*.

I cannot bear to think upon
The fact that winter's coming on.
I love to coast and hitch and slide,
But there are other things beside:
The dentist, dancing-school, and sums
Begin when chilly weather comes.
And worse than all, I cannot bear
To put on winter underwear.
I love the cold, I love the snow,
But woolen things do itch me so!

—*Betty Sage in The Century*.

A POEM YOU OUGHT TO KNOW.

By znosne uczuc miec zniwo
Bez rozczarowan, przeliczen,
Mierz ludzi miara wlasciwa,
Nie wedlug siebie, swych zyczen.
Gdy wchodzisz w serdeczne zwiazki,
Niech serce zludzen unika—
I nie wymagaj od.....gaski
Pior orlich glosu slowika.

—*La Salle, Ill., Tygodnik Katolicki*.

....Would that my pen had been plucked from some beautiful bird of Paradise and dipped in the eyes of a rainbow, that I might fittingly describe the beautiful marriage scene enacted at the residence of Mrs. E. V. Braswell, 401 St. Anthony Street, Mobile, Ala., on the evening of October 23. Just as the day god, clothed in majesty sublime, had withdrawn his galaxy of quivering, golden beams from all the earth, and wafted a good-night kiss to the young evening, who was fast approaching with her cloudless brow mounted by a crown of jewelled stars—it was then that the cords of confidence, hope, and love, binding the hearts of Hiram J. Bruister and Mary Elizabeth Braswell, were indelibly traced upon the scroll of life, and the sacred seal of holy matrimony placed thereon.—*West Point, Miss., Times*.

Editorials

Wanted: A Religious Revival

No close observer of social affairs in America or in the Old World is able to believe that at this moment "All's well with the world." If physical comfort, or even luxury, were the chief object of life we might be fairly well satisfied with the present condition of mankind. If national power and splendor could satisfy the human spirit, the spectacle of half a dozen nations, each more powerful than Rome in her most glorious days, would be superb and inspiring. If mere intellectual activity, divorced from the peace that wisdom gives, could sustain the soul, we could say that our age is exalted above all others. But if none of these things is sufficient either to establish social order or to fill the individual heart with an unfailing sense of "the joy of living," this busy generation in which we have our part is too much restless and adrift.

It needs no close scrutiny of the Churches to discover that much which our forbears regarded as vital faith has perished beyond hope of resurrection. Theological dogmas no longer hold or even interest the people. Clergy and laity alike frankly confess their disbelief in one or another doctrine, or apologetically defend it as if half ashamed of being known to confess it. As an organization of social and philanthropic activity the Church was never more alive and successful than now; but its most devoted priests would hardly claim that it is burning with ardor or toiling without rest for the saving of souls.

It will not be supposed that by this time-honored phrase we mean a snatching of the soul from everlasting torture in a place of punishment, physical or spiritual. We mean that which the phrase has always signified to the noblest spirits of every age, and of every faith,—salvation from moral ruin, from all indifference to the highest and most enduring realities of a spiritual life, from all failure of those aspirations that have lifted even the weak and the frail above hardship and sustained them through

temptation and through trial. By the soul itself we mean a conscious life in man which is capable of holding in simple sincerity to every mode of truth, despising all deceit and every form of dishonor; capable of loving unselfishly all life, sympathizing not only with suffering but equally with all moral achievement and attainment of happiness; capable in purity of heart of loving every form of beauty, whether revealed in nature or in human life.

This capacity of the conscious self is seldom realized even approximately to the full. We fall below that which we might and ought to attain. We permit ourselves to struggle selfishly for the realization of a false ideal which we call success. In our struggle we forget not only the claims of our fellow men upon our love, but even upon our sense of justice and of honor. We find ourselves in positions where we hate to acknowledge truth even to ourselves, and are often too cowardly to stand up in its defense where our business or political interests are involved. We yield to the temptation to indulge ourselves in material comforts, and thereby become callous to the finer claims of that beauty which never lives on terms of peace with any mode of coarseness or even of luxurious ease. By these lapses we disintegrate that which is best and highest in the conscious self. We live further and further down in the world of physical struggle. We become less and less capable of climbing the moral heights, and, what is infinitely worse, less capable of enjoying their purer air and wider outlook upon the world. And this is to lose the soul.

Every religion worthy of the name has made the awakening, the saving and the upbuilding of the soul its persistent aim; and when this aim is forgotten the religion is for all practical purposes dead. It may persist as a social cult, an imposing ritual, a formal assent to authority, but at best it is only a beautiful shell from which life has gone. We need to-day in this great wealth-making country, in this land of power and success, in this age of comfort and physical enjoyment, a

revival of that religion which takes hold not only of social masses and their problems, but of the individual man. No madness of emotionalism, no running after the strange gods of faith-healing or of mysticism, will achieve this supreme work. There must be a revival of that religion which has dwelt as the spirit of love and of truth, of aspiration and of power in all of the world's great faiths; of that religion which to the Hebrew prophet meant dealing justly, loving mercy and walking humbly, which to the primitive Christian meant a new birth, a sincere spirit, and a love of all mankind, which to the great discoverers of scientific knowledge in modern times has meant an unfaltering trust in the excellence and in the supreme safety of truth, which to the self-sacrificing ones of every age, of every creed and of none at all, has meant joy in renouncing the things that self-seeking men call good, if so be that they might lead some into a larger freedom and a fairer light. We need to-day a revival of this religion. Who will be its prophets?

Senator Gorman's Challenge

SENATOR GORMAN is supposed to be a man of great political sagacity. As a boy he was a page in the Senate, and he has studied politics all his life. He is as likely as any one to receive the Democratic nomination for President. He lives on the border line between the North and the South, so that he ought to be able to take more than a sectional view of the movements of public thought. His prophecy as to a chief issue in the next campaign deserves serious attention.

It was at a great Democratic mass-meeting in Baltimore last week that Senator Gorman made the pronouncement which concerns the whole country. Before his address the crowd had been entertained with stereopticon views of the meeting of the Maryland Republican convention. This was to show that both white and black delegates were associated in its business. This, it was supposed, would fire the indignation of any white Democratic heart. The Maryland Democratic convention had admitted no

men of color to its seats. It had, on the contrary, passed a resolution that this is a white man's country, and that negroes should have no part in government. It was in line with this doctrine that Senator Gorman spoke. He said:

"The Anglo-Saxon has never tolerated, and will never tolerate, the social equality or the political domination of the negro race.

"The South has passed through scenes of turbulence and disorder and rape and riot. By amendment to State Constitutions and by legislation the whites have secured control, for the time being, of their own local Governments, and the colored race is no longer a political factor in any State south of the Potomac.

"For more than thirty years this question has aroused sectional feeling and divided parties. It has threatened the peace of the States, put in jeopardy homes, and paralyzed industrial efforts. All thoughtful men realize that this canker upon the body politic must be eliminated and the supremacy of white government assured."

It was in just this way that Senator Gorman's predecessors used to talk about slavery. They were wrong then, and Senator Gorman admits it. There cannot be found a Southern leader who will not declare that slavery was a curse, and that the system should never be restored. They are equally positive and equally wrong now when they talk about the danger of negro domination and the necessity of excluding the negro from equal political rights. There never was the slightest danger of negro domination, and never anything that looked like it except for a few years in a few States, where the white people sulked and would not take part in government. To talk of the danger of negro domination is to confess that white people lack, in a fair show, ability and probity enough to hold their own.

To this subject Mr. Gorman devoted his address; this he holds will be a principal issue in the coming campaign. He is willing to challenge the country upon it and upon it to attack the President. He declares that the President has forced the issue of social equality, for did he not once sit down at a table with a man only three-quarters white? He has forced the issue of political equality, for did he not give a colored man a twelve hundred dollar office in South Carolina,

which another all white man wanted, and did he not close a post office in a little town when the people forbade the colored incumbent to serve? For these acts, and on this excuse, Senator Gorman challenges the country to make the question of social and political equality the principal issue in the coming campaign.

Let him present it if he dares. That will lift politics out of the level of discussions of mere financial benefits into the heights of moral duty. That is a subject on which people can have genuine enthusiasm, the question of equal civil and political rights for all men. With social questions politics has nothing to do, but it has much to do with political and civil rights. We can assure Mr. Gorman that he will be met, and met decisively, if he is willing to go to the country with the declaration that men are not created free and equal, and that they have not equal rights to liberty and the pursuit of happiness. There is enough sense of justice in the country to allow every man all he can get in equal and fair competition with other men; and the intelligent Christian people of the country will not believe that, as in a Virginia town the other day, a child should be shut out of a public school because it was suspected that his one sixty-fourth of Indian blood was really negro blood.

Nor will this sense of justice be confined to the North. Southern men of intelligence and integrity see and despise the wrong. The leaders of religious and educational thought are evidently awakening. Such men as Bishop Galloway and the late Bishop Haygood, of the Southern Methodist Church, are examples of it. A very striking evidence appears in the utterances of *The Southern Quarterly Review*, published at Trinity College, in North Carolina. That institution has an unusually able body of men, and in the last issue of the *Review* several of them express themselves with great freedom on Southern subjects. President Kilgo, a South Carolinian by birth, says precisely what we might have said, that "nothing is more absurd" than "the cry of social equality between the two races." "It is a political hocus-pocus of the hugest sort," inasmuch as social equality is everywhere

"a matter of individual choice," and "is no part of the negro problem, but has been dragged into this question, which is simply one of personal growth, not of social equality." "We should talk of the negro," he says, "more as a man, and less as a problem." The negro is not to be shut up to lower and industrial education:

"His right [to a higher education] rests upon the right of every hungry soul to be fed at the best tables; and to deny the negro the strongest and the highest influences is to enslave him to a life of moral weakness and moral degradation. And the God who made him in the final settlement of human history will not likely overlook such unrighteous conduct."

Professor Bassett, another Southern man, calls Booker Washington, "take him all in all, the greatest man, save General Lee, born in the South in a hundred years." He says of the negroes:

"In spite of our race feeling, of which the writer has his share, they will win equality at some time; we cannot remove them, we cannot kill them, we cannot prevent them from advancing in civilization."

He declares that political agitation aroused by "sensational appeals to the race feeling of the white man" is extremely dangerous and wrong. Ex-President F. C. Woodward, now of Richmond, says that the negro "in the forty years of his pseudo-freedom has shown capabilities that give hope of his final attainment to worthy manhood and useful citizenship," and he adds:

"He who fancies that one-third of the people of a great section can be kept in ignorance, subserviency and serfdom, while the favored two-thirds enjoy the blessings of a generous civilization, stands refuted by history."

We could have spoken no more clearly.

We declare that these bishops and scholars of the Southern Methodist Church—and we might add other distinguished Baptist and Presbyterian names—and these teachers in Trinity College at Durham, N. C., are better prophets, and better express the awakening thought of the better South than does Senator Gorman, reinforced tho he be by Chauncey F. Black, formerly Lieutenant-Governor of Pennsylvania, and lately President of the National Association of Democratic Clubs, who says

that the race issue may be the deciding one in the coming campaign, and that the race feeling in the North is more intense and more sympathetic with the South than is usually supposed, and that the course of the President "seems to make the race issue inevitable." The only reason why we do not fear a terrible struggle as the result of the ambition of the Southern negro to rise is because we expect to see a corresponding growth of the sense of right, justice and liberty among the white people of the South.

Children and Their Country Birth Right

ALL children that are born and bred in the great cities are orphans. They are the little bottle babies of civilization, beginning life far from the native heath of all childhood, where there is a silent green world bounded by bright horizons and shadowed by the stalwart form of good father trees. They are defrauded of nature's background to memory, and nothing ever really atones to them for the loss. From the first they are entertained with artificial devices. Every toy is a make-believe, and the very wall-paper in the nursery is a gay panorama of Mother Goose fables or Little Red Riding Hood lies. Their fatuous little faculties are never steadied by the real thing, not even by so much as the song of a cricket chirruping in the grass. They grow intelligent by hearsay, without ever becoming acquainted with the many sources of information so familiar to their little berry-stained cousins in the country. They read of the squirrel, and learn to draw a grammar school likeness of one on the blackboard, but they have never really seen the gay little knight of the forest within his summer castle amid the green boughs of his ancestral tree, nor watched him pack nuts in the sod beneath for winter reference. They know that birds build nests, but they have never seen anything better than a dusty sparrow's tenement district under the eaves. They have heard of the locust, but they have never experienced the awe and delight of coming upon his bleaching shell, fastened to some tree trunk, which proves his winged resurrection.

The fact is, it is a sort of legacy to be

born in the country, a fortune in butterflies, sunshine and green hill shadows that every child is entitled to receive. And no one else is so capable of enjoying such an inheritance. For, later on, the old sallo-lipped, avarice-eyed world wins us away from the heavenly mindedness of this pastoral existence; and ever afterward we are blind to many miracles that little children witness. We lose the original sense of things that once made the meadow-lark's song a part of our sunrise consciousness. We lack the fine appreciation we had then of dewy spider web tapestries, and gone from us forever is the happy comradeship we once enjoyed with lily ladies and cattail knights. And gone are the goblin shapes that threatened us from the edge of things. For in those days no real dangers beset us, and the first call of our little hay-ridden imaginations was for spooks and hobgoblins. And every little girl had the wings of a dove as she fled home through the gloaming from the fiery-eyed dragon in the calf-pasture, and every little boy knew where to look for Jack-o'-lanterns. Long since we have learned to lock the door of our house against real thieves and murderers, but every child born in the wide world of silence far beyond the noise of city streets begins life at the same enchanted angle of vision, sees double all the beauties and charms of nature.

That which marks the earliest distinction between children bred in the city and those in the country consists of the difference in the quality of their humor. The first has conventional, brick pavement ideas of proportion, and derives amusement from any departure from his standard. He notes quickly the incongruities of life in the streets, laughs at the street urchins' antics or the organ-grinder's monkey. But the latter has a more catholic wit. He comprehends that nature's humor may be expressed in the grotesque shape of a katydid or the pompous solemnity of a black beetle. He knows that it is funny for a long, green grasshopper to squat forward and click his hind legs together, or for a blustering bumble-bee to alight by mistake upon the same rose with a fierce little honey-bee, because he is familiar with that airy lore of his world which gives a tickling significance to such events. And the sense of proportion has nothing to do with the

matter. With him humor is not so much a smile as it is a psychic intuition that takes in every form of life with charming comprehension and silence.

And this gift of silence is another point where country children differ from the garrulous little prodigies of child-life in the cities. The dullest lad in the fields really has more wisdom along the way he goes than many a blue-ribbon scholar in the city schools. His limitation is that he cannot tell what he knows, while the other is so practiced in the art of expression that he can always proclaim by rote more than he has ever observed. He is a little graduated hyperbole of text-book information, but the country boy has learned the earth-secrets of wisdom at first hand. And his reticence, so far from being an evidence of ignorance or stupidity, is often the deeper, incontestable silence of one who knows. He is a young philosopher among the corn and clover who has not yet grown words-wise and strong enough to convey his meaning. Many of them never do; but when one does, we have a poet born among us, a spirit of woods and fields let loose with the wings of heaven and the heart of the earth in his song.

Parks and Others

FOR the second time Sam Parks, the most notorious walking delegate of his time, has been convicted of extortion. He is still to be tried for perjury. As there seems to be abundant proof of his guilt, he will soon retire to prison under the weight of three sentences. So far as we can learn, this man has none of those qualities which sometimes modify the public's unfavorable opinion of a rascal. He was a traitor even to those whom he professed to serve, and false to the labor doctrines which he pretended to enforce. A bad man, undoubtedly, a brutal and corrupt scoundrel who richly deserves his punishment, and actually an enemy of organized labor. But the public, if it would be just, must look beyond Parks and his Housesmiths' Union, beyond his blackmailing demands upon employers from whose building projects the members of that union withdrew whenever he called them away.

Parks gained his power by the as-

sistance of capitalists. The detection of these offenses for which he goes to prison opens a door through which the public may see those new conspiracies of employers and workmen, of capital and labor, of which we are beginning to have some knowledge. Let us not denounce this walking delegate without at the same time denouncing those who are willing to use such men, to encourage them in wickedness, and to pay them for treachery. The conspiracies of which we speak appear to have been made first in Chicago, where nineteen employers who were engaged in one of them are now under indictment. They are combinations of employers' associations and labor unions, or the rulers of labor unions, whose aim is to rob the public and to ruin any employer in the same branch of industry who refuses to join the ring. Competition in bidding is suppressed by agreement; a part of the money received by the successful bidder is distributed among his fellow conspirators, who pretended to bid against him; a part is paid to the union (or the leaders of it), whose assistance is indispensable. An employer who declines to join the conspiracy, or who, being in it, does not observe the rules for a division of the plunder, can easily be ruined or driven out of business by the aid of the organized workmen who are a part of the combination. Walking delegates are the agents who cause attacks to be made upon the foes of such a ring. Parks came from Chicago to New York, where, it is understood, he made himself useful to employers who were willing to overcome competition by methods which do not commend themselves to a sensitive conscience. It is common talk in the building trade that he was so employed; the charge has been openly made by prosecutors in the courts. But in the offenses for which he goes to prison he was working independently for himself.

Within the past week there have been published the by-laws of a combination of employers, or contractors, in New York, a combination designed to monopolize a certain branch of the building industry by the methods already mentioned. Provision is made for giving a share of the profits to the union which controls the labor. An employer who

would not come in, or who, being in, declined to sanction or profit by the combination's methods because they were unlawful, has been punished by a strike on all the projects in which he is engaged, altho he has been paying union wages and meeting all the union's requirements. He will appeal to the courts. Such combinations have nothing in common with the Association of Employing Builders, which has been contending against Parks and his kind and has insisted upon a general arbitration agreement with the unions. They are the black sheep on the side of capital, just as the corrupt walking delegates of the Parks type are the black sheep of the unions. The acts of these rings are not less unjust, dishonest and rascally than those of the blackmailer who menaces honest industry and offers to betray his union associates while he is filling his pocket with extorted "fines."

Such employers as are found in these rings, and such labor leaders as Parks, are the exception, not the rule. The great mass of organized labor is free from this taint. A vast majority of the employers in the United States are not conspiring to fleece the public by dishonest and unlawful means. We believe that they regard with abhorrence the methods of which we have spoken. They may form associations like the one that was organized last week in Chicago, to support the open shop and to resist demands which they believe to be unreasonable, just as workmen unite to support demands for higher wages and a shorter work day; but on neither side can be found any considerable number of men by whom conspiracy, corruption, bribery, or extortion is approved. On the one hand, the unions should now strive by denunciation and personal effort to discountenance and prevent all such corruption and conspiracy as are represented by Parks; on the other, we should now have from every association of employers the most emphatic disapproval of such conspiracies of capital and labor as are soon to come before the courts in Chicago. And both, in their own interest and for the public good, should assist public prosecutors in detecting and bringing to justice all, whether employers or union officers, who violate the laws.

Prevention of Suicide

A RECENT announcement by the Registrar of the Bureau of Vital Statistics of the New York City Health Department gives the startling information that during the year 1902 772 persons took their own lives in the city of Greater New York. Of this number 477 suicides were committed in the Boroughs of Manhattan and the Bronx—that is, about 22 to each 100,000 inhabitants. A comparison of these statistics with those for ten years ago shows a very great increase in the number of unfortunates. In 1892 only 241 suicides were registered in the localities now constituting the Boroughs of Manhattan and the Bronx. The death rate from suicide then has practically doubled in ten years. That conditions in New York are not the worst possible may be best appreciated from the fact that the metropolis is only fifth in the list of cities as regards the proportion of suicides to the number of population.

These figures in themselves are enough to awaken the thought that every possible means should be taken to stem the tide of self-destruction which is coming over our people and which, instead of being lessened by prosperity, has actually increased at a time when the country generally has been in the midst of good times. Analysis of the statistics seems to suggest at once certain simple remedial measures that would undoubtedly be effective in lessening the suicide death rate. A large proportion of the suicides, 268 altogether, put an end to their lives by means of carbolic acid. This is the favorite method employed by women, as firearms are by men, for the accomplishment of their purpose. Ninety-two females took carbolic acid, and the saddest element in this part of the statistics is that while the suicides of men are in general more numerous than those of women, between the ages of ten and twenty-five years this is not so, and young women and girls seek self-destruction more frequently than their brothers. It is very evident that the facility with which so ready a means of putting an end to life as carbolic acid affords can be obtained and the almost daily suggestion of its possibility by the

sensational reports in the newspapers are responsible for most of these deaths.

There is no good reason now why carbolic acid, with its bad reputation as the favorite drug for suicides, should be sold as freely as it is. There are many familiar antiseptics quite as powerful and even more available for most purposes that are not nearly so dangerous, and especially have not the suggestive quality of the evil reputation that this drug has. There is no adequate excuse why carbolic acid should be so readily available for domestic purposes, nor why it should be sold without more ado to every one who asks for it. Suggestible natures, especially nervous young women, are likely in fits of neurotic depression to turn to so easy a means of putting an end to their troubles, and the constantly recurring stories in the papers nerve them to the commission of the irretrievable.

It has often been said before, and will probably have to be repeated many times, that the sensational reporting of suicides in all their hideous details can have no good purpose, has no excuse in any otherwise possible impunity of criminals, and is only a bid for increased circulation by pandering to the morbid tastes of neurotic readers. Suicides should not be more than mentioned, and the blazing of all the sensational details should be forbidden by legislation. This, with the proper legal restriction of the sale of carbolic acid, would probably reduce the suicides by one-fourth in the course of a single year. An epidemic of typhoid fever that carried off two hundred persons would be considered to justify the enforcement of the most stringent precautions. Surely the suicide epidemic is worthy of quite as much attention.

After the use of carbolic acid, the most frequent method of suicide noted in the statistics is that by shooting. This is evidently the result of the present laxity as regards the enforcement of laws with regard to firearms. So long as any one who wishes may, without let or hindrance of any kind, obtain firearms suicides by shooting will be frequent. It may well be said that if an individual determined on suicide cannot procure a weapon of this kind, then some other means will be employed. Suicides, as a rule, how-

ever, are usually the result of a momentary loss of control rather than a deliberate act long thought of and carefully planned. The presence of an easy means of self-destruction, which every morning's newspaper tells others have employed with success as a way out of their troubles, is of itself eminently suggestive to the mentally disequibrated, whenever they are under emotional strain. Unstable minds are led into channels of thought, and consequently of action, that would not otherwise have occurred to them.

The saddest feature of our suicide statistics is the gradual reduction of the average age at which self-destruction is accomplished, and the number of young persons of both sexes who are tempted to it. Juvenile neurotics are led even by slight troubles to take this irretrievable step. Surely it is well worth the small public inconvenience that might be caused by new legal enactments and the enforcement of existing regulations in order to stop, if possible, the rising tide of this unfortunate evil. It is a distinct question of prophylaxis against a form of nervous disease. Neurotic tendencies are eminently likely to be imitated, as the well known epidemics of St. Vitus's dance and of religious emotivity of very various kinds in history illustrate so well. The prophylaxis of suicide is as much a duty of our sanitary authorities as the prevention of any other ailment that may have epidemic tendencies. When the increase of suicide comes to be generally regarded from this practical standpoint much will be accomplished in putting an effective stop to it. The cross-roads burial can no longer be employed as a preventive of the evil.

The Wreck of the Shipbuilding Company In the report by James Smith, Jr., receiver of the United States Shipbuilding Company, the story is told of what he calls an "artistic swindle." If swindle it was, it was a colossal one. It was the final and unsuccessful attempt of a number of promoters, of whom Charles M. Schwab was the chief, to combine certain larger or smaller concerns into one management, not to reduce cost of management, for the salaries were increased, but to

unload on the public a quantity of inflated bonds and stock. For this end fictitious values were put on the properties, and false figures given of their contracts and earning power, and most extravagant prices were paid, in paper. Fortunately the public was not largely swindled, as the bonds and stock, preferred or common, did not very much get on the market, since nobody wanted them. One block of \$5,000,000 in stock paid to J. P. Morgan & Co. for their part in the transaction was sold to Schwab for \$75,000. This illustrates the extravagance of the inflation. That it failed of being a gigantic swindle in fact as well as on paper is not to be credited to the purpose of the managers, but rather to their false notion of the credulity of the public. As we said in an editorial three weeks ago, the methods revealed cannot but "excite the disapproval and hostility of the average investor." They are in purpose little less than criminal, if we can judge from the receiver's report, high in financial reputation as the men stand who were parties to them.

Mrs. Booth-Tucker, killed last week in a railroad accident in Missouri, was the ablest of General Booth's children connected with the Salvation Army. She was 43 years old, and from her young girlhood engaged in Salvation Army work with great zeal. Her father calls her, "after her mother, the first among the many noble, consecrated women I have been permitted to know in my fifty years of public life." She was married at the age of 27 and leaves six children, besides one adopted child. Her husband had held a high office in the Salvation Army in India, and on his marriage added her name to his own, and is now known as Commander Booth-Tucker. Her peculiar title was that of Consul, and her judgment and decision were controlling in all matters that concern the Army here. On her marriage she and her husband were put in charge of the Army in India, and, on the secession of the Ballington Booths to establish the Volunteers of America, they came to this country seven years ago and have since been in command here.

She was regarded as the soul and spirit of all the Salvationists in this country and was especially devoted to its colony work. The Army could have received no greater loss than that of this noble, consecrated and able woman. We greatly regret that her funeral last Sunday was not made the occasion for a personal reconciliation between the members of the Booth family, and it would appear that Ballington Booth was not to blame for the failure.

The Philippine Church

Now that Bishop Alcocer has left Manila, not one of the Spanish bishops remains in the Philippines; they are replaced by American bishops. It is amusing to observe the different tone of the Catholic papers which comment on Archbishop Harty's interview published in *THE INDEPENDENT*. *The Sacred Heart Review* is severe on us for not understanding what the Archbishop says of the friars, while *The Western Watchman* says that in Philippine politics the monk has been dismal, a disappointment, as he has been a "splendid success" in the Church. But we would not call that a "splendid success" which has ordained native priests of whom *The Western Watchman* says:

"The poor secular priest who scarce durst say his soul was his own, who had seldom enough to cover his poor brown body, and who was never allowed to be seated in the presence of a monk, will disappear, and a higher order of diocesan priests will gradually take his place. From all we can learn the present native priest in the Philippines is an odd fish. The cowed monks say he does not know anything. The mitred monks say he is not worth anything. The consensus of outside opinion is that he is no better and no worse than other Filipinos of the lower class—very weak and very thriftless. We naturally ask, why were such young men ordained? Why did the bishops impose hands on them, if they were ignorant and dissolute? Is there ever a valid reason for clothing such men with the priesthood? We do not like to dwell on this phase of the Philippine question."

Theodor Mommsen

Last week we recorded the death of Lecky, the English statesman and scholar; this week Germany has suffered a similar, or even greater, loss in the death of Prof. Theodor Mommsen. On Friday, Octo-

ber 29th, he was stricken with apoplexy, and two days later he died at his home in Charlottenburg. Professor Mommsen was one of those who, following the lead of Niebuhr, reconstructed the history of Rome and carried it entirely out of the region of fiction. He had, moreover, one quality which his eminent predecessor lacked—the quality of style, which is not anywhere common among German writers and has been notoriously wanting in German historians. In politics he was known for many years chiefly as an outspoken enemy of Bismarck. In 1882 he went so far in a speech at Charlottenburg as to call the Chancellor's tariff policy a pure swindle. That was strong language for German ears; Professor Mommsen was arrested and tried for slander, but obtained an acquittal in Berlin and afterward in the High Court of Appeals at Leipzig. In foreign matters he was a pronounced foe of Great Britain during the South African War (altho his recent article in the London *Independent Review* was a partial recantation of this hostility), and during our own war with Spain he wrote a number of bitter articles against this country, several of which, however, were suppressed.

Is England
Decadent?

Prof. Karl Pearson, who is certainly one of the ablest English scholars in mathematics and science, declares that the failure of Great Britain to keep up with Germany and the United States in business enterprise is not chiefly due to a deficient system of education, but to the deterioration of the British stock. His investigations show that the same law which controls the inheritance of physical characters in man also controls that of his intellectual power. There are certain laws of inheritance by which the color of the eyes, the curl of the hair and the shape of the skull are governed, and in just the same way intellectual ability is inherited. Now Professor Pearson declares that in England, of late, there is a marked failure of the better stock to reproduce itself, while those of less intellect do not fail in fertility. Thus there are born and grow up a smaller proportion of those of superior natural ability, and a larger proportion of those of

moderate or small ability. Education will do much, but it will add no natural ability; it will only polish what it receives. The remedy, he thinks, is not to adopt foreign methods of education and endow universities, as Sir Norman Lockyer demands, but to persuade those of superior ability to raise families. As it now looks, he prophesies, England stands "at the beginning of an epoch that will be marked by a great dearth of ability," for no training or education can create intellectual power; it must first be bred. And this he calls "a problem for statecraft to deal with." Francis Galton has propounded much the same doctrine, discovering the same danger, and he proposed a remedy in the line of statecraft. He would have the state endow young people of ability on condition that they contract marriage at an early age and raise families of children.

Miss Annette Kohn writes us in protest against the rule, so general in women's clubs, forbidding the discussion either of "politics or religion." She attended last week the convention of the City Federation of Women's Clubs, and a speaker had talked with general approval until she touched on a partisan matter, when she was interrupted by a storm of protest from the whole convention. What Miss Kohn would have is a change of the rule to read, "No Sectarianism or Partisan Politics." She says:

In a land where individual right to any belief under heaven is as free as air, why should an unsectarian, purely religious discussion, one treating religion as the basis of morality, spirituality, and all that is highest in man, be barred? And similarly of unpartisan politics. There is reason in her inquiry.

In his inaugural address as President of Princeton Theological Seminary, Dr. Patton said:

"Natural theology is not enough. There is need just now not only of philosophy, but also of a Christian philosophy. Flint and Fairbairn are the two men in the English-speaking world capable of doing this work. Flint has not attempted to do it, and I do not think that Fairbairn has succeeded."

Then by all means let President Patton give it to us. He has been studying it

for many years; let him now, in the comparative leisure of his new position, give us the fruit of his studies. We need the philosophy just now more than the theology.

Mukden is the ancient capital of the Manchu dynasty. There are the tombs of their ancestors, to which the Chinese Emperor must make his annual pilgrimage. This is the city which the Russians have just occupied, an act which the Russian authorities declare has no special significance. But Russian assertions carry little credence. We cannot help seeing here another step in their permanent occupation of Manchuria. How Mukden will be, as the treaties promise, one of the open ports it is not easy to see, and with that we are concerned as well as Great Britain and Japan.

It is not very agreeable that there should be on the statute book a law deporting immigrants who are avowed anarchists, and we are by no means pleased that it should be enforced in the case of the Englishman, John Turner, against whom there is no available evidence that he has preached Anarchism in this country. Anarchism is a political doctrine that is silly enough, but the men to deport or imprison are not those who teach academically that government is wrong, but those who preach violent attacks on it by murdering rulers.

We are quite too much given to imagining that in great inventions and daring achievements the United States beats all creation; but such an achievement as that reached the other day in Germany, when an electric train was propelled at the rate of 131½ miles an hour, may well make us yield the palm. They expect there to make a rate of one hundred miles an hour commercially successful. It was quite within our privilege and ability to lead in this matter, for the principles involved were well known, but we did not venture what a German dared and did.

The French Canadian papers talk of annexation, and we are not surprised. Their readers by thousands are in this country, and they like it. But the feeling of resentment with England will pass

over, we doubt not, and the Canadians will be as loyal as ever. We anticipate no speedy enlargement of territory northward, gladly as we should welcome it. The continent will some day be under one government, to its great advantage.

We have the pleasant report that France and Denmark are negotiating a treaty for the arbitration of all matters that may be in difference between the two countries. This will be in the line with the treaty between Chile and Argentina, which is thus far the model treaty in arbitration for all the world; and much more inclusive than the treaty lately negotiated between France and Great Britain. We await similar treaties in which the United States shall be a party.

Every victory of a reformed civil service is occasion for congratulation, and among such victories is that of the Civil Service Commission over the Director of the Philadelphia Mint. He had grossly violated the spirit, but not the letter, of the law, and the President has sternly compelled the reinstatement of clerks wrongfully dismissed to make room for "laborers," to be promoted into the "classified service" for their political value.

A correspondent of the London *Times* begins a series of articles on the American Army with a long account of West Point, the rigor of whose discipline and the thoroughness of whose course of education surprise him. He compares it with the military schools of England and France and says:

"In comparison with West Point the curriculum at Woolwich is perfunctory, and that practiced at St. Cyr simple."

What have we come to see in these last days? The Rev. R. J. Campbell succeeds Dr. Parker in the London City Temple, and avows himself a believer in the final salvation of all men, a Universalist indeed; and *The Congregationalist* says:

"We are glad that we live in a time when Mr. Campbell and men like him are welcomed into fellowship in all Christian denominations."

This is a frank statement of a wide change of view as to tolerance.

Financial

The Steel Rail Pool

PUBLIC interest in the condition and prospects of the iron industry has been stimulated by recent events. For several months the price of pig iron has been falling. This decline was due in part to the unprecedented output, in part to the fact that the price had been much too high. Restriction of furnace output by 25 per cent. has thus far had little effect upon the market. Birmingham prices are down to \$10 for No. 2 foundry iron, and at that place 10,000 tons have been sold for export to Manchester at a price which nets not much more than \$8. While the price of pig has been declining, the price of steel rails has been steadily maintained at \$28 by the pool that for some years past has absolutely controlled this branch of the industry.

Probably this pool price will be reduced. The manufacture of rails is a very important part of the industry. The rail output was 2,947,336 tons in 1902 and 2,874,639 in 1901. At \$28 per ton the receipts for last year's product were more than \$82,000,000. Nearly two-thirds of these rails are made by the Steel Corporation, whose profits in the rail trade at present prices are very large, as the price of the iron (at Pittsburgh) which goes into rails is only \$16. It is estimated that the cost of producing rails at the works of the Corporation and of some other members of the pool does not exceed \$18.

Railroad companies have shown unusual delay this year in placing their orders for rails. Retrenching in other expenditures, they would like to get rails for something less than \$28. Trade journals report that the Corporation is now filling an order for 5000 tons to be exported to Korea, and that the price of these rails is only \$20 at Pittsburgh. Such a reduction for export is permitted by the pool agreement. It is said that some of the railroad companies are unwilling to pay \$28 for rails of the same quality. The price of these rails for export not only excites their interest, but also points to the tariff duty which assists the pool in exacting \$28 per ton.

To railroad delay there has been added for the discomfiture of the pool the pros-

pect of new competition. At its new works in Buffalo the Lackawanna Steel Company is now prepared to produce a large quantity of rails at low cost, and it is said to have asked in vain for a larger allotment than it had in the pool before its plant was moved. The Tennessee Coal & Iron Company is now making rails and has recently taken an order for 25,000 tons from the Louisville & Nashville road at a price not yet disclosed. The great profits of the rail trade have become very attractive to the Republic Iron & Steel Company, which may seek to obtain a share of them.

Ultimately the public pays this high combination price for rails, and it ought not to be deprived of the benefits of competition in the manufacture and sale of them. If the pool, which is controlled by the Steel Corporation, persists in exacting this price, and in seeking foreign orders at a much lower price, it will not only cause competition but will also give force to the arguments of those who demand a large reduction of the tariff duties.

CHARLES S. MELLEN, recently President of the Northern Pacific, has been elected President of the New York, New Haven & Hartford Railroad Company, succeeding President Hall, who retires to become the company's general counsel.

....August railway earnings (114 roads), according to the *Chronicle*, show an increase of 15½ per cent. in net and 15 per cent. in gross. For the eight months the increase of net earnings was 14 per cent., and gross earnings were increased by 15 per cent.

....Dividends and coupons announced:

United Copper Co., Preferred, semi-annual, 3 per cent., payable November 2d.

Minneapolis & St. Louis R.R. (Cons. Mort. 5's), Coupons, payable November 2d.

Buff. & Susq. R'way Co. (First Mort.) Coupons, payable November 2d.

Nassau Bank, semi-annual, 4 per cent., payable November 2d.

Amer. Chicle Co., Common, 1 per cent., payable November 20th.

U. S. Leather Co., Debenture Coupons, payable November 2d.

Insurance

New Zealand and Old Age Pensions

THE Old-Age Pension Bill became a law in New Zealand in 1898. The main provisions of that law are substantially that every "deserving" person, properly qualified, of course, as to residence, who has not more than £52 a year income, and whose age is more than sixty-five, shall be entitled to a pension of not more than £18 a year, or 6s. 11d. a week. Under the act "deserving" signifies a man who has not been imprisoned for more than five years after the age of 40, or after the age of 53 for four months, or even on four occasions, for any offense punishable by imprisonment for twelve months or upward and dishonoring him in the public estimation. Between sixty and sixty-five, but not before, he must have been sober and respectable. Any one who has more than £34, but less than £52 income per annum is entitled to have his income made up to the last named sum by a proportionate amount of the pension.

Some interesting details in regard to the working of this New Zealand Old-Age Pensions scheme has just been made public in an official report. According to this report it appears that on March 31st, 1902, there were in New Zealand 12,776 pensioners on the record books, representing a liability of £217,192. There were 1,055 Maori pensioners. Twelve months later the liability had fallen to £211,594, and the number of binding pensions was reduced to 12,481. The average pension showed a decline from £17 to £16 19s. The number of new pensions granted in 1902-1903 was 1,386, which included sixty-two to Maoris. Five pensions canceled in the previous year were reinstated. During the twelve months 1,686 pensions lapsed. Of this number, 1,064 lapses were because of death, 198 by refusal of renewals, 278 by failure to apply for renewals and 146 by cancellation. Among the Maori pensioners there were 103 deaths, 79 lapses because of neglect to apply, 38 refusals of renewals and 11 cancellations. The total net charge against the Old-Age Pensions Act during the period was £209,156 5s. 5d. Installments amounting to £1,667 10s. 2d. remained unpaid on March 31st, of which

amount £1,577 16s. 10d. represented installments absolutely forfeited. The cost of administering the act was £3,805 10s., of which £900 went in salaries.

The Mutual Life's Favorable Showing

THE State of New York's Insurance Department has recently finished its examination of the Mutual Life Insurance Company, of this city. The examination, made at the request of the company, was a very searching one, beginning on January 2, and was continued without interruption until September 21. A period of five years was exhaustively covered and included that between December 31, 1897, and January 1, 1903. The findings of the Insurance Department have now been set forth in its report, which makes exceedingly interesting reading. The company's total assets on December 31, 1902, are shown to have been \$382,000,000. Its income last year exceeded \$73,000,000. For the current year \$3,020,000 was apportioned as dividends to policy holders. These figures are colossal, but in addition to the foregoing, it may be said that the Mutual Life has received in premiums \$930,000,000. It has paid to policy holders more than \$620,000,000, and still holds for them more than \$394,000,000, which shows an excess accounted for over receipts of over \$82,000,000. Since the Mutual Life Insurance Company began doing business it has issued more than 1,395,000 policies, of which more than 540,000 now remain in force. Moreover, in these five years it appears that the company under the administration of President Richard A. McCurdy, has returned to its policy holders over 135 million dollars. It has received in premiums over 242 million dollars, and it has earned in interest, rents and profits over 70 million dollars. Few persons can conceive of the magnitude of the labor signified by the checking of every dollar of the hundreds of millions handled by the Mutual Company during the period in question, and the fact that everything was found correct and in strict accordance with the laws of the State speaks volumes for the company and its methods of bookkeeping.

The Independent

VOL. LV NEW YORK, THURSDAY, NOVEMBER 12, 1903 No 2867

Survey of the World

Panama Secedes from Colombia

The people of the Colombian State or Department of Panama proclaimed their independence at 6 P.M. on the 3d inst., at an enthusiastic meeting in the city of Panama. This action was taken by the Municipal Council of that city, and it has been approved by the people of Colon and other towns on the isthmus. The original plans called for such a public announcement on the 4th, but they were changed by the landing at Colon, on the morning of the 3d, of 450 Colombian troops under the command of General Tovar. These had come from Savanilla on the gun boat "Cartagena." General Tovar had at once crossed the isthmus to Panama by rail. There, in the evening, he was arrested and placed in prison. The small Colombian garrison at Panama had joined the revolutionists, who had also won the sympathy of the gun boat "Padilla's" commander. Another gun boat, "Bogota," remaining loyal to the central Government, bombarded the town for a time on the night of the 3d, killing two Chinamen, and then steamed away. There were no United States war ships at either port, except the gun boat "Nashville," which arrived at Colon late

in the evening of the 2d. Our Navy Department asserts that the delivery of cipher dispatches addressed to her commander was intentionally delayed at Colon by Colombian authorities, and its statement warrants the inference that the landing of Tovar's troops would have been prevented, for the preservation of peace and the protection of the railway, if these dispatches had been promptly

given to Commander Hubbard. But Tovar's men remained on the isthmus only a short time. Having first encamped about a mile from Colon, they afterward insisted upon entering the town and approaching the railway station. Therefore, Commander Hubbard landed 50 marines, who prepared to defend the freight houses and cars. When

the troops withdrew the marines returned to their ship. Terrified citizens were seeking refuge on vessels in the harbor. Hubbard gave formal notice to the Colombian authorities that, because the movement of Colombian troops would precipitate a conflict and endanger the freedom of transit, which the United States is bound to maintain, the railway company would not be permitted to transport the troops of either party. At 6 p.m. on the 5th the Colombian troops embarked on the steamship "Orinoco" for Cartagena and departed, leaving the isthmus completely under the control of its inhabitants. Their departure was the result of conferences in which Commander Hubbard and the railway officers took part. A large force of revolutionists was said to be approaching. The passage of the troops was paid, it is said, by the revolutionist leaders. The revolutionary soldiers are well armed, 4,000 rifles, with an abundance of ammunition, having been shipped some weeks ago from Morgan City, La., concealed under a cargo of lumber. These were landed at Porto Bello. Following the revolt, our Government ordered a dozen naval vessels to proceed to the isthmus. Some of these were at Acapulco, others at West Indian ports. The battle ship "Maine" was sent down from North Atlantic waters. These vessels carry about 3,000 marines.—The Panama proclamation of independence recites the grievances of the isthmus against the Bogota Government, ending with the rejection of the canal treaty, and declares the establishment of a separate republic. Authority was given to a Junta composed of José Augustin Arango, formerly a senator and counsel for the railway; Federico Boyd, nephew of the founder of the *Panama Star and Herald*, and Tomas Arias, formerly Secretary of Finance. A provisional Cabinet was made, the foremost member of it being Dr. Manuel Amador, who appears to have been the leader of the secession movement. The Junta's manifesto to the people asserts that Colombia, receiving large sums from the isthmus, has given in return no public improvements nor any other benefits, and that the canal treaty was rejected because the interior feared that the isthmus would gain something by it. On the 6th the "Nashville"

set out to patrol the coast, intending, it was said, to prevent the landing of any Colombian troops. It was reported on the following day, by way of Europe, that Colombia was sending 6,000 troops to the isthmus. The recent presence in New York of four or five of the leading revolutionists has given color to the assertion that their plans were perfected here. Proof of this, however, is not shown.

The Course of Our Government

Both at home and abroad, the course of our Government with respect to this uprising has been regarded with great interest. On the 2d, Minister Beaupré was virtually recalled from Bogota, to indicate the displeasure of the Washington Government because the Colombian Congress had adjourned without taking any definite action about the canal treaty. It is reported that no official notice of the failure to ratify the treaty within the limit of time was sent to Washington. On the 6th, after a Cabinet meeting, the *de facto* Government of Panama was recognized at Washington in a dispatch to the Acting Consul-General of the United States at Panama. "When you are satisfied," said the State Department, "that a *de facto* Government, republican in form and without substantial opposition from its own people, has been established in the State of Panama, you will enter into relations with it as the responsible Government of the territory, and look to it for all due action to protect the persons and property of citizens of the United States, and to keep open the isthmian transit in accordance with the obligations of existing treaties." At the same time the following message was sent to Colombia, in the form of instructions to Minister Beaupré, who was still in Bogota:

"The people of Panama having by an apparently unanimous movement dissolved their political connection with the Republic of Colombia and resumed their independence, and having adopted a Government of their own, republican in form, with which the Government of the United States of America has entered into relations, the President of the United States, in accordance with the ties of friendship which have so long and so happily existed between the respective nations, most earnestly commends to the Governments of Colombia and Panama the peaceful and equitable settle-

ment of all questions at issue between them. He holds that he is bound not merely by treaty obligations, but by the interests of civilization, to see that the peaceful traffic of the world across the Isthmus of Panama shall no longer be disturbed by a constant succession of unnecessary and wasteful civil wars."

These instructions were quoted in an explanatory statement of about 3,000 words issued on the same day by Secretary Hay, who asserted in the beginning that the President's action had been "not only in the strictest accordance with the principles of justice and equity, and in line with the best precedents of our public policy, but also was the only course he could have taken in compliance with our treaty rights and obligations." Having shown the requirements of the treaty of 1846, and pointed to the present transcendent importance of the control of the means of undisturbed transit across the isthmus, he remarked that this treaty is "a covenant that, as lawyers say, runs with the land," binding the holders of the territory "to grant us freedom of transit, and binding us to safeguard the exercise of the privilege for the Isthmus and the world." Narrating the history of the canal treaty, which, he said, was entered into at the solicitation of Colombia, and contained provisions of extraordinary liberality for her, he added that it had been rejected unanimously and without consideration by the Colombian Senate, and that the suggestions since made as to a renewal of negotiations had been too extravagant to merit serious attention. They were such as to deprive the people of Panama of hope. Therefore these people accomplished their independence. Said Mr. Hay:

"The course of the President at this juncture was marked out in advance by all our principles and precedents. He gave orders that traffic from one side of the Isthmus to the other should be kept unimpeded by either party, and charged our officers on the Isthmus to use their utmost influence to prevent any attack by one of the contending factions upon the other that would be calculated to cause a disturbance of traffic. . . . He took occasion at the same time to give notice to the world that not only our treaty obligations but the imperative demands of the interests of civilization required him to put a stop, which we hope and believe will be a final one, to the incessant civil contests and bickerings which have been for so many years the curse of Panama."

While the instructions to our officers are said to have been that they should maintain freedom of transit, it appears to be admitted that they have sought to prevent conflict in any part of the Isthmus, and have undertaken to prevent the landing of any Colombian troops. On the 7th, Philippe Bunau-Varilla, then in Washington, was appointed diplomatic agent of the new republic for the United States. He was one of the French canal company's engineers. It was announced on the 7th, apparently by authority, that in the opinion of the President no further legislation is needed to empower him to make and conclude canal negotiations with Panama, altho the Spooner Act provides that a satisfactory treaty "with Colombia" shall precede the purchase of the French company's property and rights. Colombia will send General Reyes to Panama as a Peace Commissioner. A protest against the attitude of our Government toward the revolutionists has been received at Washington from the Government at Bogota.

The State Elections

Of the State elections held on the 3d inst., the one in Ohio, following a very lively campaign, excited much interest in other parts of the country, because it was understood that the chief aim of the Democratic candidate for Governor, Mayor Tom L. Johnson, of Cleveland, was to prevent the re-election of Mr. Hanna to the Senate. It had also been said that the Mayor was Mr. Bryan's favorite candidate for the Presidency. The Republicans won a very decided victory, electing Myron T. Herrick Governor by a majority exceeding 120,000, and so many members of the Legislature that their majority on joint ballot will be 95, which is three times as large as the majority of two years ago. The vote of Cuyahoga County—which includes the city of Cleveland and is the home of both candidates for Governor, Senator Hanna and his opponent, Mr. Clarke—was reversed, and a Republican majority of 8,500 was shown there. Owing to renewed suggestions that he ought now to become a candidate for the highest office, Mr. Hanna says:

"The result of the election in Ohio in no wise changes my position with reference to my proposed candidacy for the Presidency, of which position the public has been fully advised."

On the night following the election the leading Republican paper at the State capital prepared for publication an editorial article calling for the nomination of Mr. Hanna at the national convention. This was telegraphed to papers in other cities for publication on the following day, but news of it came to Mr. Hanna, and in the middle of the night the article was withdrawn.—In Nebraska, where a Chief Justice of the Supreme Court was elected, the Republicans were successful, overcoming a fusion of Democrats and Populists by a majority of about 8,000. In Maryland Senator Gorman and his party had sought to make the race issue paramount. They carried the State by 9,000, electing a Democratic Governor and a Democratic Legislature that will choose Senator McComas's successor. Rhode Island re-elected Governor Garvin (Democrat), but by the reduced majority of 1,587. The other new State officers are Republicans. A second term was given to Governor Bates in Massachusetts, by a plurality falling a little below that of last year. There the Socialists lost two of their three members of the Legislature, and their vote was reduced by about 25 per cent. It is said that a considerable number of Silver Democrats declined to vote for Governor Bates's opponent, Colonel Gaston. Colorado shows a Republican majority of 8,000; and Governor Cummins was re-elected in Iowa by 60,000. By a light vote and without opposition, J. K. Vardaman was elected Governor of Mississippi. In Pennsylvania the Republican majority exceeded 200,000. Kentucky gave Governor Beckham a majority of 25,000. It is expected that Caleb Powers, under sentence of death for the murder of Governor Goebel, will be hanged. There was a report that the election of the Republican candidate would give him a new trial, or, possibly, a pardon. In Kentucky much blood was shed at the polls, the day's casualties of this kind having been 7 men killed and 10 wounded.—Among the elections of minor importance was that of Mr. Carpenter, Republican, to fill the vacancy in the New York Sen-

ate caused by the resignation of Mr. McClelland, Democrat, recently appointed by the President to be a member of the Board of General Appraisers. Mr. McClelland was attacked because his resignation, if followed (as it has been) by the election of a Republican, would so increase the Republican majority as to overcome the opposition of three "insurgent" Republican Senators to the policy of United States Senator Platt and the party "organization." It has been asserted that these three Senators were in sympathy with Governor Odell. The appointment of Mr. McClelland, it now appears, was due in part to a letter of warm recommendation addressed to the President by ex-President Cleveland.—One result of the elections has been the encouragement of those who desire that Mr. Cleveland shall be nominated by the Democratic party next year. They argue that the overwhelming defeat of Mayor Johnson, in Ohio, and the failure of fusion in Nebraska prove that Mr. Bryan and his doctrines now have but little influence in his party. Moreover, it is asserted that Tammany's victory in New York has given much power to the Tammany leader, Charles F. Murphy, who is the political foe of ex-Senator David B. Hill, and has expressed a preference for Mr. Cleveland, and may be able to control a majority of the State's delegates in the coming national convention.

New York Recaptured by Tammany In the city of New York the Reform Government was overthrown by Tammany, whose candidate for Mayor, George B. McClellan, now a member of the House at Washington, was elected by a plurality of 63,617. Even the borough of Brooklyn gave a majority (1,808) against Mayor Low, and a larger majority for Comptroller Grout, whom the Reform (or Fusion) party had at first renominated and who was removed from the Fusion ticket after he had accepted a Tammany nomination for the same office. During the latter part of the campaign Mr. Grout was one of the leading speakers on the Tammany side, and at the polls he received a few hundred more votes than were cast for Mr. McClellan. The latest figures for

the heads of the tickets are as follows: Low, 251,289; McClellan, 314,906; Dev-
ery, 2,935. It had generally been expected
that a larger vote would be cast for Dev-
ery, the deposed Tammany Chief of Po-
lice, who was running in opposition to his
former Tammany associates, and whose
speeches were an amusing feature of the
campaign. Tammany will control the
new Board of Aldermen by a majority of
more than two to one. In the powerful
Board of Estimate and Apportionment
the Reform Party will have only one of
the sixteen votes, having elected the
President of one of the small boroughs.
Very few fraudulent votes were cast, and
the count was an honest one. The dis-
comfiture of Hugh McLaughlin, the old
Democratic leader of Brooklyn, who op-
posed the Tammany ticket, establishes
the supremacy of Mr. Murphy, the suc-
cessor of Richard Croker in the leader-
ship of Tammany. Two years remain of
District Attorney Jerome's term, and he
gives notice that he will keep up his fight
against the gamblers, even if it should be
necessary to use funds contributed by
private citizens. General Greene, the Re-
form Commissioner of Police, will retire
at the end of the year. Mr. McClellan is
38 years old. It is thought that Mr. Mur-
phy will support him as a candidate for
the office of Governor.—The great ma-
jority in the city on the referendum for
the bill appropriating \$101,000,000 for
the improvement of the Erie Canal, to-
gether with the majority in Buffalo and
smaller favorable votes in a few other
places, overcame the opposition mani-
fested in many interior counties. The
majority in the State was about 270,000.
—In San Francisco, Mayor Schmitz, the
labor-union candidate, was re-elected by
a plurality of 6,000, a Republican and a
Democratic candidate dividing the oppo-
sition.—In Bridgeport, Conn., Dennis
Mulvihill, known as the "stoker" Mayor,
was re-elected, altho some had predicted
that his course at the time of the street
railway strike would cause his defeat. In
the neighboring city of Ansonia, Mayor
Stephen Charters, a labor-union leader,
was re-elected by a reduced majority.—
Mormon influence exerted in support of
the Democratic ticket gave Salt Lake City
to the Democrats by 2,300, altho in recent
elections almost as large a Republican

majority has been shown there. The line
appears to have been drawn strictly be-
tween the Gentiles an' the Mormon
Church.

Reciprocity with Cuba

Before the opening of the
extra session of Congress
it was asserted by oppo-
nents of the treaty of reciprocity with
Cuba that nearly forty Republican
members of the House would vote
against the bill which is designed to
make the treaty effective. The oppo-
sition is now stimulated and led by the
American Protective Tariff League,
whose representative in Washington
is ex-Congressman Tayler, of Ohio,
and whose purpose is to prevent the
reduction of any tariff duty by a treaty
of reciprocity. Some think that a long
tariff debate in the Senate cannot be
avoided. This year's sugar crop in
Cuba is said to be the largest ever pro-
duced on the island, amounting to
about 1,250,000 tons.—At the House
Republican caucus that nominated him
for Speaker, Mr. Cannon made an ad-
dress which was regarded as favoring
a policy of confining the legislation of
the coming regular session to the an-
nual appropriation bills. At the Dem-
ocratic caucus, Mr. John Sharp Wil-
liams, of Mississippi, was nominated
for Speaker and thus made leader of
his party in the House. Mr. Baker, of
Brooklyn, who recently rejected a rail-
road pass, introduced a resolution de-
claring it to be the sense of the caucus
that members "should not accept
passes or other favors from the rail-
roads." By a vote of more than three
to one it was referred to a committee.—
By order of the Secretary of the Navy,
three midshipmen of the senior class at
Annapolis have been dismissed from
the service, a court-martial having
found them guilty of hazing.

The Hague and Santo Domingo

After an interval of a
month The Hague
Court resumed last
week to continue the consideration of
the Venezuela case. This month's re-
cess was allowed so that the various
Powers could put in their counter-
pleas to the preliminary briefs that had

already been submitted. Last week the French and Belgian arguments were presented; Italian, English and German arguments were also heard. The arguments of the Allies were to the effect that Venezuela had only consented under threat of war to guarantee the blockading Powers 30 per cent. of the customs, and that an equal distribution of the 30 per cent. of customs among the other nations, therefore, would be unfair to the Allies, who had incurred great military expenses. The American case has not been argued as yet, but Mr. Bowen and Mr. Penfield have submitted to the Tribunal their preliminary statements concerning the position of this country. Mr. Penfield argues that if any Government is entitled to preferential terms it is the United States, because, by the warlike operations the United States claims that were being paid by Venezuela were discontinued for the time being. Mr. Bowen, in his statement, asserts that the Allies went to The Hague to avert the possibility of war, but why they resorted to warlike measures is a question they cannot answer creditably; and, he continued, if they went to war for a lack of good sense and trusting they would come out all right, they deserve to be punished for their folly.—The general situation in Santo Domingo remains about the same as last week. Ex-President Jimines, who, in the event of the revolution succeeding, hopes to be made President again, has left Porto Rico, where he has all along been watching the revolution, and is supposed to be on his way to Santo Domingo. Other leaders are reported to be converging on the unhappy Republic in order to wrest the fruits of victory from General Jimines. Another war ship has been sent by the United States to the scenes of action, for it is reported that all the Northern coast towns are closed to commerce.

England and
Ireland

Mr. John Redmond, the leader of the Nationalist party in Parliament, has made what is reckoned the most important agreement for a sale under the new Land Act. Mr. Redmond inherited from

an uncle a large estate at Wexford, and this estate he has just sold to his tenants, under terms by which one class of tenants acquire their holdings on payment of an annuity which involves a reduction of 20 per cent. on their present rates. This act of Mr. Redmond's has excited no little discussion among the supporters of the Land Act in Ireland. Mr. Redmond, it is only fair to say, has forgiven the tenants all arrears, amounting to £4,000, on condition that they pay him one-half a year's rent. More important for the status of the Irish party is the fact that William O'Brien has determined to give up his seat in Parliament for Cork City, and to retire from the governing body of the United Irish League. In a letter to Father O'Flynn, President of the Cork Branch of this League, Mr. O'Brien complains that he is attacked on all sides for his connection with the Land Act, and is abused "with a ferocity and a hatred beyond that incurred by any Irishman on this question. The policy which the Irish party, the National Directory, the National Convention and the representative boards of the country have approved, is made a subject of reproach and derision by a newspaper which is the only source of information for one-half the people of Ireland. Under these circumstances he feels compelled to give up his share in the leadership of the Irish party, and also to surrender the editorship of *The Irish People*. His resignation seems to have been forced on him by a letter of Michael Davitt to *The Freeman's Journal*, which bitterly denounced John Redmond for the terms under which he sold his Wexford estate. Mr. O'Brien has been Redmond's strong support in Parliament in the leader's attempt to conduct Irish matters with some degree of moderation.—In a speech at Birmingham, November 4, Mr. Chamberlain addressed some 9,000 of his fellow-townsmen, and again discussed the tariff situation. Among other things, he commented on Cobden's position and quoted Cobden's saying to the effect that the United States would some time abandon manufacturing and that "their workmen will go back to the land and dig and delve for us." Mr. Chamberlain remarked that Americans had not conceived their national destiny in quite this manner. Those who oppose his preferential tariff for the Colonies Mr. Chamberlain

attacked as "little Englishers" who lacked the ambition to bring the Empire more closely together.

Operation on the Kaiser On Friday, November 6th, Emperor William returned to Potsdam from meeting the Czar at Wiesbaden. At that time it was not known that anything was the matter with him. Sunday morning, to the surprise of everybody, the *North German Gazette*, which is scarcely read outside of official and journalistic circles, gave this announcement:

POTSDAM, November 7th.

His Majesty to-day underwent an operation for the removal of a polypus from his larynx. The operation was performed by Prof. Moritz Schmidt, and was most successful. His Majesty is only enjoined not to speak until the wound caused by the operation is healed.

VON LENTHOLD,
SCHMIDT,
ILBERG.

Professor Orth is in attendance on his Majesty at Potsdam, and has made microscopical examinations of the removed fiber. He declares this to consist of a soft, web-like membrane with few cells. Part of the cells contain tiny, brown-colored granules which are the result of previous hæmorrhages. He asserts that the polypus is entirely benignant in character, but adds that it still remains to be seen whether the granules are also really benignant. He is to give a lecture, at the express command of the Emperor, in the Medical Society Rooms at Berlin, on the exact nature of the illness. In estimating the seriousness of this operation it must be remembered that the Emperor was operated on in 1877 for a swelling behind the left ear, and also that both his father, Emperor Frederick, and his mother died from cancer. The first diagnosis of Emperor Frederick's case asserted that the growth on his larynx was of a purely benignant nature, just as in the case of the present ruler. However, the statements, both public and private, of the physicians attending his Majesty are direct and unequivocal to the effect that he is in no danger. The latest bulletin announced that he had slept quietly and was doing well, and it is expected that he will be entirely recovered in eight days after the operation. He is in other respects in ex-

cellent health, has already taken luncheon with Count von Bülow, and is planning a hunting party for the near future.

Russian Military Service

A strong light is thrown on the burden of military service in Russia by certain recent proceedings in Odessa. The military authorities in that town had observed for some time an extraordinary increase in the number of "free tickets" made out by the divisional military doctors to release soldiers who had served only a short period of their term. Secret police agents were set to work at Odessa and elsewhere, and many of the soldiers who had received these "free tickets" were hunted up, re-examined by special physicians and rigorously questioned as to the manner in which they had become physically unfit to complete their term of service. In this way it came out that many of these soldiers had deliberately tampered with their health in order to escape the intolerable burden of the army. The authorities succeeded in arresting an organized band of ruffians who have made a business for years of thus liberating young Russian soldiers. At the head of the society was a certain Kreek, who had under him a number of pseudo-doctors and touts; one of these touting agents would invite a young soldier to a restaurant, where he would set forth the terrible burden of military service, the dangers of death and the possibility of being drafted to some distant region where he would be under the command of brutal and arbitrary non-commissioned officers. When the soldier was thoroughly frightened, he would be sent to Kreek's headquarters and put in the hands of a physician, who would incapacitate him for military purposes, on payment of a certain sum of money. The young man might choose to become deaf, in which case the "physician" of the society would bore his ear and damage the tympanum irrecoverably. The society was prepared also to inoculate with any disease, and the circumstances of the affair are described as being nauseating in the extreme. Kreek and his accomplices have been sentenced to deprivation of all personal, civil and property rights and to two years' or more servitude in a correctional corps.

Hungary The situation in Austria-Hungary is one of complication within complication. There is the general opposition of Hungary to practically every measure adopted by the Imperial Government at Vienna, and there is furthermore a pretty general disagreement among the members of the Liberal party within Hungary itself. Count Apponyi is bitterly opposed to the slightest concession made by the party under the leadership of Count Tisza, and adopts a policy of obstruction which is at least effective. A program of the party recently adopted at Buda-Pesth includes the following points: All Hungarian military authorities are to correspond between themselves in the Hungarian language; the education of Hungarian cadets is to be facilitated in such a manner as to insure in time such an increase of Hungarian officers that their number may correspond with the proportion of Hungarian soldiers in the common army; the rights of Croatia and Slavonia remain untouched. The passages concerning the military prerogatives of the Crown need to be cited verbatim, as the development of the situation must largely depend upon the view which will finally prevail as to their adequacy. The program of the select committee contained the following clause: "The present condition of things in regard to the language of command and of service in the army is to be maintained on the basis of the constitutional prerogatives recognized as belonging to His Majesty in the year 1867." For this passage Count Tisza substituted the following clearer wording: "The party holds fast to the standpoint that the King has the right to maintain the language of command and of service of the Hungarian army—which constitutes a complementary part of the whole army—on the basis of the constitutional prerogatives recognized as belonging to the Crown in Article XI of the fundamental compact of 1867." Meanwhile the Czechs have been awaiting the end of the Hungarian crisis to claim for Bohemia whatever should be granted to the Magyars, and now send out a complete program of national requirements. This program demands electoral reform, pro-

claims hostility to all attempts to combine Bohemia economically or politically with the German Empire and calls for the use of the Czech language in the army.

The Far East The Russian Government acted at Mukden as was to be expected; having marched the troops out of the city, it immediately marched them back again, thus showing that it has no intention of abandoning Manchuria. Russia threatens openly to assume sole charge of the province unless China consents to dismiss Yuen, the Taotai of the city, and beheads another mandarin who was guilty of punishing Chinese bandits in the Russian employ. Tsang-Ki, the Governor-General of Mukden province, was, until recently, pro-Russian, but turned, at last, against Russia on account of her exorbitant demands. As a consequence he is now confined as a prisoner in his yamen (official residence) for his views. The Government at Peking has sent the Viceroy of Pe-chi-li province into Mukden to investigate the state of affairs there and, if possible, to arrange some settlement with the Russians. He went much against his own desire. It is known that China, through her Minister at Washington, has sought to interest America in the condition of Manchuria; Secretary Hay, however, has informed the Chinese Government that American can do nothing so long as Mukden is open to our commerce in accordance with the terms of the treaty. On the other hand, the appointment of Na-Tung to the Presidency of the Wai-Wu-Pu, or Foreign Office, is held by some to indicate that Peking has decided to accept support from Japan. Meanwhile, the negotiations between Japan and Russia at Tokyo appear to be progressing most amicably. At St. Petersburg interest is largely centered on the attitude of America toward the Far Eastern question. The *Novoe Vremya* expresses surprise at the hostile feeling shown in America toward Russia; Russia, it says, proved her friendship in the days of the Revolution, and offered no resistance to America at the time of the Spanish War; but now, when Russia is dealing with the difficult problem of Manchuria, America seems to forget all this and takes sides against her old friend.

The Triumph of Tammany Hall

BY GUSTAVUS MYERS

AUTHOR OF "THE HISTORY OF TAMMANY HALL," ETC.

THE politics of New York City has presented many strange vicissitudes, but never in its municipal history has the city experienced such a severe setback to decent government as that which was given last week, when, in a total vote of 569,130, Tammany Hall was restored to power by a plurality of over 63,000 votes. Exulting hopes that Mayor Low's administration would be continued have turned to blank despair. In New York City the best elements view the result with consternation, and throughout the civilized world, wherever Tammany and its misdeeds are known, the outcome has provoked the most intense amazement. Mayor Low's administration has been the best New York City has ever had; that over 314,000 citizens should deliberately vote Tammany back to power seems a verdict beyond comprehension. New York City has had its Fernando Wood and its Tweed and its other plundering administrations, but those administrations were installed and kept in power by an enormous fraudulent vote. The election last week, however, was practically free from fraud, so far as illegal voting was concerned. On election night General Francis V. Greene, Commissioner of Police, remarked in the presence of the writer: "This election was not stolen; it was fairly won." The popular mandate was, therefore, unmistakable. The very knowledge that Tammany's great plurality was legitimate all the more deepens the despondency of the forces of decency and accentuates the thoroughness of their defeat. And for this reason, also, all those past Tammany successes, in which fraud was so largely instrumental, seem insignificant beside the present victory. On its face the result of the election is ominous for future efforts toward good government. It seems to argue an inexplicable perversity—in fact, an indictment of human nature itself. It seems to prove that the

majority of New York City's citizens prefer the incredible alternative of government by a clique of known "grafters" to honest administration. It seems to prove that the majority are impatient of both the practice and the preaching of honesty, and that bold, unrestrained theft on a grand scale is the sum of their will. It seems to prove an intolerance of moral cleanliness, and a demand that the city shall relapse into the familiar, slimy, Tammany ways. It seems to prove that the example of good government given by Mayor Low's administration has not only been wasted, but, paradoxical as it may seem, has caused an overwhelming revulsion.

But has the result proven these things? In sheer disgust many good citizens will abandon hope in the settled conviction that the majority are knaves or dupes or both. Doubtless both of these elements were represented in Tammany's plurality, but it is idle to suppose that they were all-inclusive. Had the vote been close it could have been said that probably the slum vote turned the election, but where such an enormous plurality was given it is clear that deep operating causes pervaded the community. In its palmiest days, when the ballot laws were inadequate and invited abuses and when a fraudulent vote of 25,000 in a single election was a common occurrence, Tammany was lucky to count on a plurality of 70,000. In this election Tammany has been confronted with a solid, militant opposition; the low character of its leaders and its record has been abundantly contrasted with the excellence of Mayor Low's administration; all the newspapers, except one influential morning newspaper and two newspapers of meager circulation, were emphatically opposed to Tammany, and yet Tammany has won by a plurality that, in basic reality, overshadows all its former triumphs. It is astounding; it is bewildering.

What caused this result? What was

it that actuated thousands upon thousands of citizens who have no sympathy with "graft," vice and crime to vote Tammany into power?

The contributory causes were various. No one of these can be awarded precedence. Interwoven and working together, they operated to produce the aggregate.

New York City is a Democratic city, and Tammany Hall is the "regular" Democratic organization. Mayor Low is a Republican, and while he has appointed both Republicans and Democrats to office, the administration has been regarded by tens of thousands of Democratic partisans as virtually more or less of a Republican administration. Prejudice not fact was the basis of this view. But Tammany hastened to take full advantage of this undercurrent of feeling. Throughout the campaign it harped incessantly upon the necessity of a Democratic administration ruling a Democratic city. It pointed out the important bearing the election would have upon the Presidential election. This continued and skillfully put appeal to all the underlying prejudices of Democrats had a powerful effect. It won over to Tammany a large body of independent Democratic voters.

Conjoined with this factor was the irritation of many voters at the policy of conducting the city on the "blue law" plan. The cities in New York State have shown an increasing resentment at the excise laws imposed upon them by the Republican majority which the rural districts have in the Legislature. In the demonstration of this feeling New York City has been foremost. New York is a cosmopolitan city; and a large part of its population are opposed to what they regard as sumptuary laws. The slums seek the extremes of vices; but thousands of citizens who would not tolerate vicious excesses either in private or official conduct, look upon strict excise or other "blue" laws as an unwarranted deprivation of their rights as human beings. To the 2,500,000 tenement house dwellers in New York City Sunday is the one day of relaxation. To a majority of these, especially those of foreign birth and training, a little beer with their meals on Sunday is held either indispen-

sable or desirable. Most of them are hard-working, sober citizens, and they see no harm in having this form of refreshment on Sunday. The excise law, however, compels the closing of all saloons on Sunday. Tammany never enforces this law, because the saloonkeepers pay blackmail. The present administration has enforced the law. It has also, at times, enforced "blue laws" requiring the closing of stores, such as candy, cigar and stationery stores on Sunday. This policy aroused a blazing popular indignation, which not all the evident merits of Mayor Low's administration could counterbalance. It is clear that the mass of voters prefer an administration, however corrupt, which does not infringe upon what they hold as their personal liberties. They will put up with official extravagance and tolerate low characters in office rather than have a clean administration which, in its zeal to enforce the laws, subjects them to a series of petty tyrannies which interfere with their primary comforts.

Moreover, great numbers of the working classes were dissatisfied with the new excise law passed this year by the Republican majority in the Legislature. This law increased the liquor tax from \$800, the former rate, to \$1,200 a year. In order to meet this increase many saloonkeepers have charged 15 cents for a pint of beer instead of 10 cents, as formerly. The laborer who has to subsist on wages of \$10 or \$12 a week, and is accustomed to buying seven or eight pints of beer a week, has found this increase of 5 cents on every pint a severe drain upon his resources. Thousands of laborers regard the new excise law as simply a Republican device to reduce the taxation of the rural districts at the expense of the population of the cities.

This huge element of dissatisfaction was reinforced by thousands of property owners and business men. It does not speak highly for the morals of the community to say that rich and apparently respectable citizens prefer to pay blackmail to have sanitary, tenement house or other violations of the law overlooked rather than be put to the expense of complying with the law. I am not, however, dealing with moralizing but with fact.

Mayor Low's administration has not countenanced any of these violations; it has enforced the various laws sternly. In doing this it incurred the enmity of a large class whose morals may be said to reside in their pocketbooks. It is cheaper for them to pay a \$100 bribe in order to avoid expending \$1,000 for necessary alterations. To a unit this element not only votes for Tammany, but used its undeniably great pressure to urge others to do so. Owners of tenement houses are known to have warned their tenants the day before election that if Low was re-elected the rents would be raised. Intermixed with these three factors was the widespread personal unpopularity of Mayor Low. Personality is a powerful factor in elections—more powerful, many observers agree, than principle. At any time an election may turn upon it, either as a single force or associated with other questions. Mayor Low has given ample proof that he has neither the innate nor acquired knowledge of dealing with men—a prime requirement in a leader. The mass of voters look upon him as a "silk stocking"—as one who neither understands nor sympathizes with their life. These voters cannot reconcile personal pretentiousness or exhibition of hauteur with their theory of republican institutions. In brief, they are repelled by the sight, either real or fancied, of a public official seeming to place himself above them. Their idea of a Mayor is one who is popularly accessible, and who takes a pride in acknowledging that he is of the people. Rooted deep in the minds of the masses in New York City is a profound hostility to even the slightest symptom of aristocracy in government. It may not be expressed superficially, but it exists with a mighty force. No one who has studied the constituent voting elements in New York City can fail to be impressed with its prevalence. The mass of voters would rather be governed by proven "grafters" who are of them and mingle with them, than give encouragement to any man or movement which seems to forbode government by aristocracy. In a city where class distinctions are so notoriously exploited by Tammany Hall, nothing could be more destructive to the endurance of a good

government movement than the popular belief that the movement is headed by "silk stockings." It cannot be doubted that among New York City's mass of population the impression has gone deep that Mayor Low has placed himself on an altitude far removed from them; that he is distant from, does not and cannot understand their life.

Superadded to these other factors were the influences placed at Tammany's disposal by every corporation which has profited by, or expects to profit by, official favor, or which fears the hostile exercise of official action. The enormous contributions made by these corporations to the Tammany campaign fund have constituted the great scandal of the campaign. The subject is too great to be dealt with adequately here. Suffice it to say that Tammany, by grace of these corporations, had a larger campaign fund than ever in its history. Tammany's aim is not sentiment, but votes. Resounding platforms and dignified speeches sound well, but votes speak better in practical politics. To get out a full vote it is politically necessary that the "workers" should be well supplied with funds. These funds are used by Tammany in various ways; and even if they serve no corrupt end, they at least instill a mercenary enthusiasm into the thousands of "workers." There are over fifteen hundred election districts in the city, each of which is manned by a captain. Where the Fusion forces had \$40 to an election district, Tammany had \$600. The work of Tammany's "workers" was tremendously effective; in point of results it stands unsurpassed in the history of the city's elections.

Other factors helped to swell the result, but the first four I have outlined here conspired most to swing over to Tammany thousands upon thousands of voters who are not enrolled Tammany men and have no direct interest in the affairs of that organization.

While depressing, the outlook is by no means hopeless. Tammany will impose upon the city its usual misgovernment. A popular reaction and revolt will ensue, and if the decent forces nominate a Democrat of high courage, independence, and of attractive, sincere personality—one who appeals to the mass of the voters—

Tammany will again be defeated. Perhaps that will be years away, but those who are enlisted in the fight for good government must not be one-year volun-

teers, but must be prepared to continue the fight in adversity as well as when circumstances are propitious.

NEW YORK, CITY

Has the Tide of Prosperity Turned?

BY THOMAS F. WOODLOCK

EDITOR OF THE "WALL STREET JOURNAL"

THE theory of "cycles" in business—prosperity alternating with depression—is an old one in its essentials. It was, however, first systematically developed so far as it bore upon security prices by the late Charles H. Dow, founder of the publishing firm of Dow, Jones & Co., when he wrote financial articles for the *Mail and Express* of New York City during its ownership by the late Cyrus Field. Mr. Dow by a careful comparison of price records and a process of judicious generalization therefrom conclusively demonstrated that prices of securities moved in cycles as to time, and that, while the periods were irregular, there was enough regularity about them to justify recognition of a general law. According to this law—which seems to be pretty general in human affairs—progress is made in an undulating line continually rising above the line of progress and as continually falling below it by a process of overaction and subsequent reaction.

In the stock market, which must surely be regarded as about the best barometric record of general trade conditions available to the observer, the movement of prices is in a series of "swings"—as Mr. Dow termed them—and of these "swings" three different kinds were noted—viz.:

1. The main movement, usually running for a period of years;

2. The secondary movement usually running for from thirty to ninety days (occasionally longer); and

3. The tertiary movement—or the relatively small daily fluctuations caused by merely "traders'" operations.

At a given moment it may be said

that all three are in operation. The main "swing" is constantly doubling on itself in the secondary "swing," while the latter is also doubling on itself in the tertiary "swing." The forces governing the tertiary "swing," are, as I have said, the "traders" or small speculators endeavoring to coin the fractional fluctuations of the day. The secondary "swing" is the result of the stronger speculative forces endeavoring to make a larger scale of profits and willing to take weeks for the process. The main or primary "swing" is made by the general conditions of business over a period of years, and is the movement which alone is worth consideration in any general view of the situation. The thing to remember in connection with it is that it is a good record of the duration and extent of good or bad times. It is not necessary to explain in detail why this is so, as the general truth of the proposition that the movement in the prices of representative stocks is very fairly indicative of general business conditions is pretty evident.

Now, the facts as to the movement of security prices are clear. Without going further back than the close of the war we may note the following periods of large advance and decline:

1868-1873.....	Period of advance.
1873-1877.....	Period of decline.
1877-1882.....	Period of advance.
1882-1885.....	Period of decline.
1886-1892.....	Period of advance.
1892-1896.....	Period of decline.
1896-1902.....	Period of advance.

In the period of advance, 1886-1892, there was a temporary interruption caused by the Baring failure in 1890, but the silver inflation and the large wheat crop of 1891 caused renewed "boom."

The 1896-1902 period of advance ended last year, so far as security prices were concerned, and 1903 has been a period of continuous decline, almost uninterrupted, and practically unprecedented in character.

The notable thing about the foregoing is that the fluctuations in general business have very closely followed the fluctuations in representative security prices. Following the 1873 panic there was marked commercial depression which reached its high in 1877 just when securities were turning; in 1881 when securities were well on the down grade business was very good, but became decidedly depressed by 1885, when securities were beginning to go up again. In 1893 the business of the country was at its high in every branch when the panic broke, but it was prostrate from 1894 to 1896, and did not really begin to recover till 1897, by which time stocks were rising fast. When, on August 8th last, the stock market was on the verge of panic, and down an average of 40 per cent. from the highest prices of 1902, the general business of the country was at its very best. Price changes in the security market have thus in the past closely foreshadowed corresponding changes in general business; and if the past be a true guide we are at this moment facing a contraction in trade, the only uncertainty about which is its extent and duration. The questions that observers are asking themselves are whether it is depression or merely reaction that is to come, and whether it is to be long drawn out or merely a short surcease.

With the presumption created by the downward movement of security prices in the past year clear before us it is not difficult to see what the matter is. The country has enjoyed a period of extraordinary growth in wealth, thanks to abundant harvests and enormous production and sale of all kinds of goods here and abroad. In the early nineties the Western farmers were staggering under a load of mortgage debt. By the close of the century they were lenders of money in Wall Street, and by 1901 they were investors and speculators. The country, as a whole, thanks to its enormous exports of commodities, had greatly reduced its indebtedness to foreign capital, and like the farmer had gotten out of debt in

1900, but it quickly speculated itself into debt again in 1901. What with enormous business in merchandise and commodities, and a fever of promotion and stock-gambling of totally unprecedented intensity, it is not surprising that the supplies of loanable or "floating" capital finally became absorbed and "fixed," with the result that a general liquidation became absolutely necessary in the stock market. A halt in general business was bound to follow. The direct causes of the latter were the rise in the necessities of life—food, fuel and clothing—and the consequent demand of labor for increased compensation. These demands could only be met as long as the ball was kept rolling; the moment it stopped they could not be granted. The depletion of credits owing to the locking-up of floating capital stopped the ball rolling, and the process of reaction set in. It is now making itself felt in every line of business.

Happily, there are excellent reasons for believing that we need not apprehend a very serious or prolonged depression in trade. The main trouble is that we have *overdone* everything a little—most of all promotion and speculation. We have had a wonderful run of good luck, a wonderful period of growth in general wealth, and have, in the current slang phrase, "run it into the ground." It is not that we have to *undo* what has been done (as in 1893 with the Silver Purchase law) so much as that we have to *grow up to* what has been done. Our business has for the moment outgrown our capital, and our business men, especially our financiers, have had to learn that even the United States is subject to the general laws of trade and human nature. So far as can be seen, there is nothing in our commercial position that will not be cured of its ailments by a little economy and a little rest. But it is certain that rest and economy are emphatically needed for a time, if we are to avoid the use of more strenuous remedies. Next year is Presidential year, moreover, so that the time is opportune.

If there be anything disquieting in the outlook it is the labor question. Relations between employers and employees have been strained somewhat more than usual in the past year or two, thanks, largely, to the unfortunate prevalence of unwise counsels with the leaders on both

sides. The advent of contraction in general business, leading to curtailment of manufacturing, will create a condition in which labor will be at a marked disadvantage, and the result will be the generation of a considerable mass of passion unless the wisest and most conservative among the leaders can regain sway over the opposing forces. Nevertheless, so much has been done in the way of educating opinion on both sides that we may well hope for the best in the long run. The pessimists have not hitherto been the truest prophets in this country.

Human history has been summed up in a cycle of six words, thus:

War,
Poverty,
Peace,
Prosperity,
Pride,
War,

and as the Greek proverb has it, "Πόλεμος πατήρ πάντων"—"War is father of all things." Finance and commerce are, after all, a kind of war, and the historic cycle holds good for them, too.

NEW YORK CITY.

An Historical Discovery :

A Lost Treatise of Robert Browne, Founder of Congregationalism

BY CHAMPLIN BURRAGE

WHAT can be more fascinating than the work of the antiquarian, who carries on his investigations in such a country as Great Britain, with its countless second-hand book stores, book stalls, etc., and with its endless resources for historical research! Indeed, there is possibly not a land in all the world where so many rare books can be procured at so low a price as in the British Isles, provided one will but search for them.

Here, without looking further, the historical investigator may find, if he will, the field of work for a life-time. Matters of fresh interest constantly come to his notice. Treasures in the shape of books and manuscripts often come into, or pass through, his hands. And sometimes, at least, unexpected good fortune grants him a discovery of unusual importance in his special line of research.

To find anything new concerning Robert Browne after the indefatigable researches of many Congregational scholars is a rare occurrence, but for a hitherto almost entirely unknown treatise of his thus suddenly to reappear before the gaze of men, after the lapse of nearly three hundred and twenty-five

years, is rarer still. The writer of this article is sure, therefore, that many Congregationalists in America, as well as in England, will be interested to know that he has discovered the original of the greater part of the text of that book to which Dr. Henry Martin Dexter refers in "The Congregationalism of the Last Three Hundred Years, As Seen in Its Literature: . . ." (pages 78-9), when he says, that Browne "returned to England, where he published a book, whose name even I have as yet failed to recover, and which, so far as I am aware, now exists only in a few passages which were quoted from it by Bancroft, afterward Archbishop of Canterbury, in his famous sermon at Paule's Crosse on the 9th of February, 1588, and in the indignant comments made thereon by certain Scottish writers who reviewed that discourse."

What if Dr. Dexter had lived to this day to know that a writer had found this lost work, evidently the very copy that Richard Bancroft used in preparing his sermon, and that its contents would throw such new light on the early part of Robert Browne's career as to require its rewriting!

Such at any rate is the case, and the discoverer finds especial pleasure in calling attention to the contents of this treatise, because from the time that Bancroft preached his famous sermon until to-day hardly any one has even mentioned this work, and we may suppose, therefore, that very few have ever seen it. The title, fortunately or unfortunately, is still wanting, but nearly three-fourths of the text remain in the unique copy brought to light by the writer, and near the beginning, underlined in ink, is a passage providentially preserved which includes the two well-known sections quoted by Bancroft and somewhat besides. This passage, which made certain the identification of the treatise, reads as follows:

"Yea and further I Iudge, that if the Parliament should establish such names, and those the officers according to those names, which seeke their owne discipline that then in stead of one Pope we should haue a thousand and of some Lord byshops in name, a thousand Lordly Tyrants in deed, which now do disdaine the names. This haue I found by experience to be trewe, both in forreine contries and in myne owne Contrie. I can testifie by trial of Scotland, which haue traueled it ouer in their best reformed places, as in Donde, Sat. Andrewes, Edenborowe and sundrie other Townes. And haue knowne the king in great daunger and feare of his lyfe by their Lordlie Discipline, the nobles and people at great discord and much distracted, and yet all men made slaues to the preachers and their fellowe elders. So that myne owne ears have hard the king by name to be verie spitefully abused by their preachers in pulpitt, his doings and commaundements called in, reuoked, or repealed, or els established and performed as he durst or could do for feare or daunger of them. Also in euerie Towne I found the chiefe magistrates in awe of them, much murmuring grudging and whispering conspiracies to be made on all hands, some tymes them on the kings syde to be put out of office, and their aduersaries put in and some tymes them on the preachers syde put downe, and others sett vp. Further I haue sene all manner of wickednes to abound much more in their best places in Scotland, then in our worser places here in England. And to conclude when I came away, all the whole land was in a manner wholie diuided into parts, much people in armes, and redie to ioine battel, some with the king, and some against him, and all about the preachers discipline."

Thus much for the identification of the treatise.

A little over two years ago the writer, on his first visit to England, one day came across a volume largely composed of manuscript letters. One of these was signed, "Your Worships humble to comman[n]d, Robert Browne, writte[n] this last of December: 1588." It consisted of twelve folio pages, the text of the letter covering nine of them. It was in the main beautifully and compactly written in an uncommonly legible hand for that period, and on the back of the last leaf, in the rather scrawly writing of another but contemporary hand, were the words:

"M[r] Brownes aunswer to M[r] Flowers letter. For his iugement in diverse particuler point[es] in this letter yo[u] may not accompte of it. For he hath reformed them and hym selfe likewise. The word[es] to be looked vppe I haue rase [underlined] w[ith] my pen."

The writer at once noticed the excellent preservation of this letter,—the clean, untorn pages; the regular writing, unmistakably like the *fac-simile* of Robert Browne's signature to be seen in Dr. Henry Martyn Dexter's "The Congregationalism of the Last Three Hundred Years;" and, further, the interesting character of some of the material in the letter.

About a year ago, on the writer's return to England, the same volume again came to his notice. Once more he became interested in this manuscript, and desiring to gain a greater familiarity with the peculiar hand-writing of that period, he determined to begin to decipher this document, and if it proved valuable, to read it through, and to make at the same time a legible transcript. He commenced the task at once. Several days passed; the passage quoted earlier in this article had been transcribed, as also a good part of the remainder of the text, when one evening the writer happened to think it might be worth while to see if Dr. Dexter knew of the existence of this particular letter. He had not read far in that learned specialist's great work when he came to the words quoted from him above, with the passages cited from Richard Bancroft's Sermon. As he looked over the latter, it seemed to the writer that he was reading strangely familiar words, and he realized with a start of surprise that he had been deciphering the original of this very lost Treatise, and glancing

over the text of the letter more closely he saw that the underlined passage quoted included both of the citations in Pancroft's Sermon. Then he read these words in the scrawly hand on the back of the last leaf of the letter, "The word[es] to be looked vppe I haue rase [underlined] w[i]th my pen," and then with sudden intuition he saw that Bancroft had quoted from this very letter, and that it had never been printed, so that it was no wonder that Dr. Dexter did not even know the title of this lost Treatise, for it had never had a title.

As one looks over the letter, however, may not one perhaps justly come to believe that the following words from the last paragraph before the signature may have been one cause of the preservation and present good condition of the manuscript, and that they may yet safeguard it as a memorial of this man, until the ink fade away and the paper return to dust?

"Thus Louing Vnckle I haue spent some howers, to shewe my duetifulnes towards you, & to gratulate you with a piece of scribled paper this new yeares euen. I would it were such, as that you might take it for a new years guift: which if you like not, it is no more worth, then your fancie thereto, doeth afford it. Yet I beseech you, how so euer you dislike it, let it rather ly in the bench hole safe, then be consumed with fier, because I haue no copie thereof, & if it appear in the light at anie time, that in no case it be anie præjudice or daunger to me, seing I wrote it by your demaund."

But where has the letter been all these years? That we may probably never know. Thus far we can only be certain that it was written by Robert Browne December 31st, 1588, (Old Style), or January 10th, 1589, (New Style), and that on February 9th, 1588, (Old Style), or February 19th, 1589, (New Style), Richard Bancroft preached his noted Sermon. From that day to this we may suppose the letter has been lost to the world, for it never seems to have been quoted from again until this year 1903. May we then perhaps suppose that the manuscript was returned for a while at least to Mr. Flower's "bench hole" for safe keeping? Particulars we cannot, of course, expect to know, but we may, nevertheless, well believe that that letter has had a history in its already long existence of three centuries.

Altho the letter at first glance appears so perfect, it really lacks one folded sheet (four pages), which probably never will be identified, if indeed it exists. Even in its present condition, however, the letter makes a document of about six thousand words or more, and contains, we may be quite sure, the most valuable and probably most interesting portions of the Treatise. For this we may well be thankful.

The general contents of the Treatise may next be outlined, for we are dealing with no ordinary letter. To any one who will but hastily glance through this manuscript there will appear abundant evidence that Robert Browne has at least roughly grouped what he desired to say under several main headings, evidently suggested by a letter from his uncle, Mr. Flower, containing questions "concerning names and titles, auctoritie and government" in the Church. The main divisions, as they are indicated from place to place in the development of the Treatise, seem to be the following:

1. A short Introduction on the mystery of the presence of Antichrist in the Church. (This quickly merges into the first main section of the Treatise namely:—)

2. A Discussion of "the names of Elders, pastors, doctors, deacons."

3. A Discussion of "the offices" of Pastors, Elders, and lastly of Bishops. (A portion of this section at the close is probably wanting.)

4. A Discussion of the "state of the Church." (A very considerable portion of this section has reference to Antichrist and the interpretation of the Apocalypse. Probably the greater part of this division is lost.)

5. A Discussion of "ecclesiastical discipline."

6. A Postscript concerning the word Presbyter.

This plan may serve to convey a general idea of the contents of the Treatise, but for want of space no detailed account of the views therein expressed may be given at this time, except as to some extent indicated in the two following quotations, which possibly may be considered in part, at least, rather remarkable passages for Robert Browne to have written:

"Now that I condemne or at anie tyme haue condemned all England or all Churches of England for wanting or as wanting discipline, it is vntrue.

"I. Cor. 4.20. Rom. 14.17. Luk. 17.21. Mat. 13.19. Mat. 4.23.

"For I say and alwise haue saied, that who so hath the word of God, and doeth live according to it, he hath the discipline, government or kingdome of Christ.

"Thirdly that for auoiding of heresies and strange opininions [*sic*], none be admitted or suffered to refuse or withdrawe them selues which hould not the doctrine of christianitie after some exacter forme of catechisme, and be also able to geiue a good reason of their religion and profession in all such matters. And that therefore if they haue conference, readings or expositions, in priuate houses, the officers appointed for that purpose do serch and trie their opinions and doctrine and see their orders, and if nothing be erroneously and disorderlie attempted, that they be suffered, yea though some smaller fault or error be committed or escaped, yet if a greater fault happen, that they be punishable accordingly.

"Lastly that none be suffered to haue their voice or right in chosing church offices and officers, but onely such as are tried to be sufficiently grounded and tried and to be able to geiue a reason of their faieth and religion. And that the ciuil Magistrats may if they will, be both present and directers of the choise, yet permitting anie man to make iust exceptions against them which are to be chosen [:] Further that they, which are to ordeine, consecrate or pronounce them authorised, do it not in their owne name, but by voice and testimonie of the most of those wyser sort, whose consent and voices for the most part he hath gathered and doth shew. Also it skilleth not who do pronoun[ce] and consecrate them whether bishop or other, so that it be according to the forme aboue mentioned and the parties be a wise and good man, and the officers chosen be not by number, as that there must needs be but one preacher and no moe suffered in such a parish, also two, three, or syx other helpers, arbitrators or presbyters if they will haue them so called but that for teaching, who so hath bene priuat[ely] tried verie often, and then is both willing and called openly to vse his guift may so continew, yea and be further also authorised if no dislike be iustly shewed [:]"

1. This writing furnishes us with a second letter of Robert Browne's still existing in manuscript, this being far the more extended and important, and probably the earlier, of the two.

2. The existence of this Treatise in the form of a letter determines forever the fact, that, contrary to Dr. Dexter,

Richard Bancroft did not quote in his Sermon from a printed book of Robert Browne's, of which even the very title is lost.

3. In this letter is to be found the title of another writing of Browne's that appears not to be mentioned elsewhere—namely, "a seuerall treatisse in latine, touching the herring fishes hauing a writing of letters upon them, taken in the east seas." (This also probably was never printed, and the present writer feels certain that Browne's "treatise . . . against one Barowe" was nothing more than another letter of his, which Bancroft in some way secured and referred to in his Sermon.)

4. This Treatise makes it clear that Robert Browne's health had already been undermined and his spirit crushed by harsh treatment, so that tho still a young man he could write in one place, "I am pore enough and broken to to [*sic*] much with former troubles, and therefore had no need of further affliction," and in another, that he had already "bene in more then twentie prisons." What wonder if even thus early his mind had been impaired by such persecution, or that his buoyant courage of earlier years was gone!

5. This letter gives us a new portraiture of Browne,—one that attracts rather than repels, wherein is revealed in this young man a certain sadness and tenderness not usually ascribed to him by those who have depicted his character.

6. This Treatise has further a most important bearing upon the question as to whether Robert Browne in heart ever really conformed to the Church of England. It may be said that he certainly seems at this time to have been at least a little more favorable to the Established Church than in former years, but he also says in one place, where he has been writing concerning the "state of the Church," that he has "conceiled some matters, offensiue to be delt in," so that he may have left some things unsaid which we might be glad to know. No other known writing of his, however, of which we have any remains, gives so good an idea of his views at this time concerning the Church of England and church discipline as this. (A whole "platforme" of Church discipline, the

product of his thinking after his outward conformity began, forms part of the Treatise.)

7. Lastly, the words in this letter, "For before my first voiage beyond sea, and sence my last retourne," unless very loosely used, suggest, contrary to Dr. Dexter, that Robert Browne after all did visit the continent more than once. This will require the historian again to look over the accounts of his life given by Fuller, Heylyn, Collyer, etc., and thus to reconstruct the story of the early part of Browne's career as may be possible and necessary.

The writer believes that the result of such reconstruction will be in outline to this general effect: That Robert Browne went to Holland and very likely to Middelburg twice, first in the latter half of 1579, or early in 1580, and but for a short time; that there he may have joined Cartwright's congregation, but probably falling in with Dutch Anabaptists or with those of a tendency toward Anabaptist views, he soon became dissatisfied even with Cartwright's ideas of reformation, and, on his return to England or before, finding that at Norwich there were a large number of Dutch people of some-

what advanced views, he journeyed thither; that among the Dutch in Norwich he met with his first successes, and that after a time he was able to win to his way of thinking a small company composed chiefly of English, but also of at least one or two Dutch people; that in the autumn of 1581 he returned to Middelburg, this time bringing most of his little company with him; that here in 1582 his three earliest and best known books were published; that in 1583 he left Holland forever and crossed to Scotland; that during the next two years or so he must have been much of the time in various prisons, where his ardent hopes of reformation were to a considerable extent successfully crushed, and that at the time this letter to Mr. Flower was written, sick at heart and impaired in bodily and mental powers, he seems like a man in the dark seeking for that which he nowhere can find, even the elusive golden *via media* between conformity and nonconformity, where he might enjoy liberty of conscience and freedom from bodily punishment,—a road, however, that unfortunately had not been opened to the public in his day!

LONDON, ENGLAND

What is God?

BY H. C. HOWE

AND what is God? The Blacksmith truly
says,
God is the anvil, and the hammer, fire
And iron, and the bare space beside the door,
And patient horses waiting to be shod;
To which the farmer, God is April days
And broken ground, and sunbrowned arms
that tire
Holding the plough handles while the glebe is
trod
From chill daybreak until day is no more.

What is God's will? Hear the woodchopper
speak:

To hew the forest down and let the sun
In on the shadowed ground; my axe and I
Are ministers that serve God's sacred will;
The Planter answers, from the living creek,
I turn the streams, and let the water run
Upon the sands and plant my orchards still
As God desires, beneath the brazen sky.

The mountain goat knows God, God is the
rock
And the scant cleft-sprung herbage, and the
plain
With dwindling trees, and cascade's cooling
spray;
And watchful eagle soaring slowly past;
The spotted pickerel darting with a shock
Upon his prey sees God in every stain
In the bottom sand, cool hollows overcast,
And water weeds that hold green light of day.

Hear the wind laugh that drives the tumbling
cloud:

I am God's will, and move in his domain,
The broad sea-bosom, and the mountain-top,
Across the western sun, and through the night.
God's are we all, respond the starry crowd,
We look on lovers and on hopeless pain,
We know God watches for our twinkling light.
We are his will, as is the least dew drop.

CORNELL UNIVERSITY, ITHACA, N. Y.

The Life of Gladstone

BY WILLIAM GARROTT BROWN

THE biographer of Burke and of Cobden, the best living writer of vigorous and resonant English prose, and equipped also with an ample experience in public affairs, Mr. Morley

Octagon Room at Hawarden, where Gladstone kept his letters and documents.

needed no special warrant of personal association or of a formal nomination to the office for undertaking a life of Gladstone.* But because he did undertake it on these grounds, the task became as laborious and exacting as it was already challenging and conspicuous. He passed under an obligation to his countrymen, to all English-speaking peoples, to the

thoughtful reading public of the world: an obligation to do his work in full detail. He must make a complete and fortified account of that long life which is doubtless of wider interest than any other that belongs to England in the nineteenth century—a life which he justly compares with but two other contemporary careers, Cavour's and Lincoln's.

All this he has done, and with a spirit and ability incontestably adequate to his wide responsibility. He has done more, much more. Judgment, insight, sympathy, good taste, literary skill—these high gifts have been fairly lavished on his imposing theme. He has not merely told the story of a wonderful career; he has found and followed the right “bio-

graphic clue” to it all. He has disclosed with consummate clearness an extraordinarily intricate character. He has solved the riddle of a personality that puzzled half the world. More still: in these three ample volumes are many chapters and episodes that may separately tempt a desultory interest and fill an idle hour, but for an interest more sustained and serious, an appetite more robust, the whole is an abundant but an ordered feast. Here is no loose, rambling train of anecdote and incident, no mere arrangement of documents and drawing of inferences, but a free and flowing narrative, a firm-jointed, whole biography, a stately, balanced, fascinating book.

Let me put my praise of it in the simplest way, and hasten—lest in this brief space I omit it altogether—to make what abatement of it my mood permits. Not particularly given to the steady reading of long books, I have followed this undeviating narrative of nearly two thousand generous pages with an interest that caught fire at the beginning, never once went out, and rose at the end to a glowing enthusiasm. No partisan of Gladstone, I was won to respect, to faith, to admiration, to affection, and was stirred by the closing scenes to an emotion which I did not think that any pen but that long silent pen of Macaulay could ever arouse in me again with parliamentary battlepieces and the arrayal of English scenes and characters and classes, and that old pomp of a funeral in Westminster Abbey.

The mention of Macaulay's name suggests a way to state plainly how I think that Mr. Morley, without any derogation from the striking excellence of his work, might have adapted certain parts of it to the needs of readers not familiar with all the men and causes that have arisen in English politics since the first Reform Bill. With his decision to make the book a biography and not a history no reader has a right to quarrel. But there are places, particularly in the first two volumes, where readers may consider that

* THE LIFE OF WILLIAM EWART GLADSTONE. By John Morley. 3 vols. New York: The Macmillan Co. \$10.50 net.

he has not been at sufficient pains to acquaint them with questions, situations, personalities, which they must understand if they would understand the course and attitudes of the central figure. Macaulay's plan of stating, sweepingly and strikingly, the elements of situations and the strong points on both sides of a question, of picturesquely grouping characters and forces, might have been the best plan for dealing with such sub-

ly. We would have welcomed, for example, such portraits of Peel and Disraeli, of Granville and Hartington, as he has made for us of the friends and the adversaries of Burke. Without distinct conceptions of Gladstone's associates and opponents it is hard to be sure that we have the right human insight into his conduct in certain crises.

And with all the advantage there is in studying a life from its inner sources, we

cannot estimate it a right without a constant reference to its outer aspect and its mutual impingements with other lives. Sometimes, I think, a reader will fear that he is too sedulously accompanying Gladstone, enlightening and elevating as that companionship is; that it would be better to withdraw from him a little oftener; to take one's stand in the crowd about him and observe him from a slight remove; to close the open book of his motives and impulses and go into the House of Commons and hear him speak. I do not mean that Mr. Morley neglects to show us Gladstone from these points of view; he does

Gladstone. From a painting by Sir J. E. Millais at Christ Church, Oxford

jects as Maynooth and the Divorce Law, the Oxford movement and the Eastern Question. Of course, we all know now what serious faults there are in Macaulay's presentments: faults of too great emphasis and too glaring contrasts and superficial analysis. But no one has ever pointed out those faults more clearly than Mr. Morley. We would gladly trust him to use a method whose peculiar temptations he so thoroughly understands, and which he has shown that he knows how to use skillfully and brilliant-

ly. We would have welcomed, for example, such portraits of Peel and Disraeli, of Granville and Hartington, as he has made for us of the friends and the adversaries of Burke. Without distinct conceptions of Gladstone's associates and opponents it is hard to be sure that we have the right human insight into his conduct in certain crises. And with all the advantage there is in studying a life from its inner sources, we cannot estimate it a right without a constant reference to its outer aspect and its mutual impingements with other lives. Sometimes, I think, a reader will fear that he is too sedulously accompanying Gladstone, enlightening and elevating as that companionship is; that it would be better to withdraw from him a little oftener; to take one's stand in the crowd about him and observe him from a slight remove; to close the open book of his motives and impulses and go into the House of Commons and hear him speak. I do not mean that Mr. Morley neglects to show us Gladstone from these points of view; he does observe him in these ways, and always with a rare balance of sympathy and judgment. My feeling is merely that he might oftener have turned from the diary, and particularly from the letters—by no means Gladstone's happiest means of expression—to the tracts and speeches, the books and articles, and to the talk and writings of other men about him. But these two general strictures, if they are just at all, hardly apply to the admirable third volume. There, scarcely any means to explain, to illus-

trate, to vivify, is neglected or used otherwise than skillfully and powerfully; and because this is so, one is almost tempted to attribute the method in the earlier parts to an inclusive and artistic plan. There is an effect of cumulation, of drawing ever nearer to an ever swelling theme, of the renewal of an energy which, in fact, has never waned. The sense one gets of being at last in the very midst of the action is indescribably exhilarating to one's interest and stimulating to one's own imagination. It is as if we had long been watching a distant vessel, at first small on the horizon, slowly advancing and growing and rising up out of the sea, but with many a stop and curious tack and some long, outward reaches, as though it were perplexed about its bearings; and now it stands up clear above the great curve of the ocean, and with a firm and steady course comes straight our way, until at last we see the foam at the prow, we hear the beating engines and the shouting voices, we feel our own slight craft rocking with its mighty wash, and then, even as it passes, a mist falls down and mantles it, and it goes staggering onward, like a great ghost, into the unknown.

It is hard to see how any but a very cynical reader of this book can cling to the doubts of Gladstone that have always found lodgment in a considerable number of minds: I do not mean doubts of his integrity or even of his adherence to his own difficult ideals, but of his fitness to be associated with the greatest good men of his century and with the famous champions of English liberty in other centuries. For my own part, I was amused at my own boyish ardor in the matter of his principal rivalry when—the book scarce finished—I chanced to find an American woman, in a review of Mr. Bryce's "Contemporaries," hinting at a superiority in Disraeli of sincerity as well as ability, and contrasting their courses during our American Civil War. Mr. Morley, and Gladstone himself, make enough, in all conscience, of an error of Gladstone's judgment at that time, which, in the knowledge he then had of American affairs, was rather unfortunate than egregious or deeply discreditable. It was, in truth, no such simple matter for a foreigner to make up his mind on one

side of our great controversy, as Mr. Morley intimates when he mentions Cairnes's "Slave Power" and but two of Olmsted's books as sufficient material for an understanding of it and enough to justify an Englishman in disregarding the entire Southern contention.

But the sting I found in this American woman's partiality came, no doubt, from a deeper resentment at the hardness of another rare, illustrious woman; from the pathos of that last interview when the old Minister, growing blind and deaf, laid down before the old Queen the intolerable burdens he had borne so long. "When I came into the room," he entered in his diary, "and came near to take the seat she had now for some time courteously commanded, I did think she was going to 'break down.'" But she did not break down. On the contrary, the conversation, as he tells us, "may be called neither here nor there. Its only material feature was negative. There was not one syllable on the past except" that she thanked him too profusely for an old service to her family! And this for a leave-taking of the servant who had first been sworn of her Privy Council fifty-three years before, of the statesman who had lighted up her whole long reign not more by the splendor of his deeds and talents than by the white example of a life as pure as her own. Mr. Morley forbears comment, but we may recall a remark which he has made elsewhere: that women do not judge character either so soundly or so kindly as men, because they do not know so well the ordeals of practical life which teach both justice and character.

Country squires and Bagehot's "enjoying English gentlemen" may go on judging him as women judge, tho they cannot be as hard as the best woman can with a man that is not on her side. Lord Salisbury showed in his admirable memorial speech in the Lords that even a Tory could apply to this character a more masculine standard and that masculine sense of integrity which Lord Derby had showed long ago when he kept trying to draw Gladstone away from the Peelite group to take in the party of birth and property the place which for want of him was falling to Disraeli. But few of Lord Salisbury's

class would join, even yet, in his tribute to "a great Christian man." An American, to measure Gladstone's moral heroism when he came at last to trust completely his own liberal sympathies and convictions, particularly in his fight for Ireland, must come by some chance into a realization of the prejudice he defied—of its might in England, and of its quality. A good tho unpleasant way to sense it is to speak out innocently for Ireland and Gladstone before an enjoying English gentleman—enjoying, let us say, a cup of tea, with an elaboration of refined enjoyment few Americans can acquire, and conversing over it with the ripest culture and with the last Oxford modulation in his tones. The experience that follows makes one feel that the epithet "bloody" and the invective "damn your eyes," tho now confined to cockneys and sailors, are fairly accurate expressions of an English mood which is not so circumscribed.

Gladstone began himself with a great weight of prejudice, tho his prejudgments were of a different sort; and that he did not have the "unalterable perseverance in the wisdom of prejudice" which Burke thought so valuable in English character, is the reason why many Englishmen have never understood him

and never will. He puzzles Americans another way. They cannot understand why he should so long have borne the burden. They cannot understand how, in 1864, he precipitated a crisis by words which seem to them innocuously mild, by venturing to hold "that every man who is not presumably incapacitated by some consideration of personal unfitness or of political danger is morally entitled to come within the pale of the constitution." That sentence did, in truth, stand for a prodigious progress, for the lifting of mountains. The strength and the fineness of those loyalties and traditions with which he began, the glorious freedom which at the last he had honestly earned by trying out every other principle in society—these are the poles of this statesman's greatness, the marks of his growth and range. His loyalties were to no selfish interests, but to ancient bulwarks of authority, to inspiring glammers of antiquity, above all, to solemn and mystical religious ideals.

And his progress was not the measure of his weakness or his insincerity. For an answer to that sometimes openly declared but oftener hinted and intimated charge, for the clue to the puzzle of his life, Mr. Morley wisely goes into his most inner and individual nature and

Courtesy of the Macmillan Co.

Hawarden Castle

experience. It is to be found in the long, exalted letter which he wrote to his father on leaving Oxford, desiring his consent to enter the Church; in the searching rules he had even earlier made for himself—binding himself to strive for the spirit of love, of sacrifice, of purity, of energy—rules which there is multiplied evidence to show that he obeyed every day of his life; in his unequalled industry, tho he had no need to work; in his choice, for a charity to which he gave a great part of his time, of the hardest and most thankless and dangerous of all fields—the field of “the great sin of great cities.” In these records of a majestic conscience and a tireless sympathy lies the true explanation of what his great world saw and wondered at.

In these and in the powers and equally marked peculiarities of his mind and temperament; for he was from the first “a character.” The

novelist who should invent for us such another might rest in security of fame. As it is here disclosed it reminds one strikingly of Lincoln’s, now by likeness and now by contrast. For a while, indeed, I could not help remarking a little enviously how far more fortunate this English leader was than ours in all the earlier parts of his life—in

his home of wealth, his vigorous, successful father, his Eton and Oxford, his friendships with such men as Hope and Hallam, his sitting under Newman, his tutelage from Peel, his easy entrance into politics and office—all so unlike that story we know of the young prairie giant. The strength and happiness Gladstone got from culture and from charmed associations were indeed great. He himself, however, put his finger on a joint in his armor that rougher rearing might have mended, when he says: “There was a singular slowness in the development of my mind, so far as regarded its

opening into the ordinary aptitudes of the man of the world.” And how shall we hold it against him that he had better opportunities than another if he took every one of them as an opportunity for self-improvement and for service? Or that the best of all our modern life was open to him if he pressed into it with a great desire to live it all the noblest way?

It is true his character was not simple, but highly complex, delicately fretted and ramified with as elaborate an architecture as ever was displayed in the building of a man. But how shall we belittle him for that if nevertheless he had a spirit great enough to run through it all like the fire of a furnace, as a strong heart pours red blood through arteries and veins? A powerful and ardent soul informing an intricate character, and wielding to good purpose an elaborate machinery of talent—this is the

Gladstone Mr. Morley pre-

sents to us. His conception is of a trained athlete—the athlete and champion of morality, justice, liberty; a wrestler with old wrongs and an uprooter of the prejudice of centuries; a strong swimmer for whom life had presented no fit opportunity if it were not a stormy sea. The tone

and manner of the whole book is chosen well. It is

that of addressing squarely the largest human motives; of literary wholesomeness; of an advocate warmed, full-voiced, but deliberate and confident. One feels throughout the tough fiber of English character and the English constitution, and the sinew of the champion of change.

The inestimable value of Gladstone to England was in his turning the currents of public opinion and shaping the body politic to face a new age of progress and of freedom. But the value of this splendid life was universal. It made the best qualities of mankind not merely effective, not merely praiseworthy in a sober garb, but brilliant and fascinating. Whoever will not surrender them to force shall have forever the light of that golden

*CATHERINE GLADSTONE

(Miss Catherine Glynné married William E. Gladstone July 25th, 1839.)

lamp which, in Mr. Morley's noble figure, he always upheld. Whatever new leader shall anywhere arise in the long fight for reverence, reason, culture, purity, justice,

liberty, they shall be inspired with his dauntless energy, they shall hearten their followers with his name.

DURHAM, N. C.

A Macedonian Appeal to the American Conscience

[It is not wise to publish the name of the writer of this article, who is a resident of Turkey. He knows of what he speaks, and what he says deserves attention.—
EDITOR.]

HERE is a story in an ancient book about a man who dreamed one night that he saw a certain Macedonian standing on the shore and shouting a plea to the dreamer to aid his countrymen. So moved was the seer by this summons that he felt it to be a divine call and started off the next day to do what he could in the line desired.

There rings in the ears of the writer to-day a similar appeal, and he sends it on to the men of conscience across the sea. He is well aware, however, that an appeal to the conscience is useless where there is no ability to act. Hence the object of this article is not only to show the desperate need of help for Macedonia, but also to show that the United States of America can and should give such help.

There is a tendency in some quarters to salve the conscience with the remark that the newspaper reports of atrocities are doubtless much exaggerated. In the past there has been some foundation for this charge. It is impossible adequately to impress those who have not lived in Turkey with the weight of tyranny which bears upon the people ordinarily and daily. But in their efforts to do so the Bulgarian papers have exaggerated so much, have lied so unblushingly, have fabricated so many outrages, have cried "Wolf" so often, that now, when the wolf is tearing the flock and seems likely to annihilate it, the outside world listens in semi-indifference.

The present situation, however, is such as to make one rather wish to minimize than to exaggerate its horrors, lest the

easy-going shrink from facing the facts squarely and the fastidious turn from them in disgust. Even one of the Bulgarian-hating Greeks lately told me that he could not sleep nights for thinking of certain things which eye-witnesses had related to him as occurring in the Monastir region. An English friend also tells me of a young German who was in that district in a capacity which threw him with the soldiery. Not being gifted with official German's usual cold-blooded complacency toward wholesale murder (when committed by those who can bestow railway concessions), he threw up his situation and fled the region in dismay. In order that Americans may be informed of the condition of affairs I select a few instances which come from such trustworthy sources as to preclude any doubt of their truthfulness.

A former pupil of an American school, where every effort is made to inculcate truthfulness as a cardinal virtue, came in as a refugee from the ruined village of Smilevo. This was the place which the soldiery burned and to which they then compelled the villagers to return from their hiding-place in the woods. Of these non-combatants many were "killed, wounded and missing." A younger sister of the woman mentioned is missing. This woman confirms the statement of others that soldiers threw little children into burning buildings. Other people were shot in trying to run out of burning houses. Six maidens, seeing the orgy going on in the village, made a dash for the woods. Soldiers chased and quickly overtook them. Their screams were

heard for about an hour. Then silence fell and the soldiers returned to the village, without taking the trouble to bury the corpses. And that deed of hell was committed in the twentieth century, no further from Buda Pest, the handsome capital of Hungary, than is Philadelphia from Cincinnati.

In a certain hospital is a woman whom a friend of mine has seen. She has five great gashes on her head and neck. She was fleeing from her village with her baby in her arms when a cavalier on horseback attacked her. As she instinctively threw up her hand to protect her head four of the fingers were sliced off. She says that she dropped her baby and it was hacked to pieces by the valiant warriors. And German officialdom (I charge not the German *nation* with such crimes) may chuckle that the Turk is given a "free hand."

The late official order forbidding the troops to bring any more kidnapped children into Monastir may have puzzled some American readers. This shows that they live where the practice of sodomy is not common.

It is better to draw the veil over details at this point. There are certain general facts* which may be stated. Men who have been over as much of the ground as the Turks will allow them to estimate that 140 villages have been burned in the Monastir Vilayet. Let us divide this by two. These villages probably average over 100 houses each, but let us divide this also by two. With an average of five people to a house you have 17,500 people homeless (less those who have been killed), and winter not two months off. Or, taking the highest estimate, you have

* Since writing the above, more accurate statistics have come to hand. A gentleman with the best facilities of any one, except the Turkish officers, for learning the facts gives the figures following as the result of careful investigation:

District.	Villages attacked.	Total houses in them.	Houses burned.
Ochrida	40	3,259	3,021
Resna	19	737	722
Kastoria	23	3,021	2,717
Presba	5	275	262
Florina	5	1,500	1,500
Monastir	3	510	500
Demir Hissar.....	4	767	725
Kitchevo	5	160	77
Krushevo	6	163	163
	110	10,392	9,688
Krushevo City had shops and houses burned.			600

Grand total.....10,288
Counting 5 to a house, at least 50,000 are homeless.

70,000 people in this condition (minus those killed). There was a great outcry in America last year over lack of coal to warm good houses. What if the houses themselves had been lacking?

It is a notorious fact, already widely reported, that after the only doctor in Krushevo had been killed, the only drug shop destroyed, and wounded people (mostly *women*) were lying in bare, looted houses in a dreadful condition, Hilmi Pasha, the good Hilmi Pasha, Inspector-General of the Province, appointed to introduce Austro-Russian "reforms"—Hilmi Pasha refused the Sisters of Mercy permission to carry medicines to the place. "It is a condition and not a theory which confronts us."

"But," it is argued, "the Bulgarians are just as savage as the Turks." Let us see. I admit that America herself has suffered at the hands of Bulgarians in the outrageous capture of Miss Stone and the blackmail levied for her release. But no violence was done the person of the captive. And the great American nation is just enough to remember that the women and babies of the Monastir region had no part in planning or executing the capture. And, after all, would it have occurred if there had been good government in Macedonia?

The most brutally barbarous acts yet done by Bulgarians were the throwing of a bomb into an open-air theater in Salonica, where many women and some children were seated, and the placing of the infernal machine which wrecked the train near Adrianople. In the latter case several Turkish women were hurt. But the committee had warned the railway not to transport passengers. The man who placed the bomb did not know that women would be hurt, altho he may not have cared. My point is that he did not lay his hands upon and slaughter women directly. And the women were not violated before (or after) being wounded. So also the well-dressed Salonica dames whose screams filled the air when the bomb burst near them—altho none of them were hurt—were subjected to no nameless outrages, such as have become so common in the Adrianople and Monastir districts that reports of them scarcely excite comment. But, granting that the Bulgarians were just as bad as the Turks

in every respect, would that not be all the more reason for stopping the whole ghastly carnival of outrage? Were there none but armed insurgents and soldiers in the country it might be a different matter. But shall unarmed and helpless women and children be tortured and done to death and no man lift a finger? The Macedonian cry for help is plain, piercing, heart-rending.

But it is claimed that the United States has no responsibility in the matter. Has he no responsibility who, with a good revolver in his hand, sees a ruffian choking a woman to death in an alley? "Ah, but the cases are not parallel." Very well, change the illustration. Has he no responsibility who sees an officer trying to rescue a maiden from two or three kidnapping "cadets," who are dragging her to a bawdy house, when his strong arm, or the weapon in his pocket, might turn the scale?

"But America can't go to war with Turkey." No, America is too far away to wage a successful war with Turkey. But America can stop the excesses which the Turkish soldiery are committing tomorrow—if she will. How so?

The British nation is deeply stirred by the state of affairs in European Turkey. So is France, but she is so tied to Russia (whom nothing but her appetite ever stirs) that she will do nothing. England hesitates and is distracted because of her fear that the history of the Armenian affairs will be repeated. She wished then to intervene, but found that her European

neighbors were preparing, the moment she became embroiled with Turkey, to make a united attack upon and humiliate her, if they did not even dismember her Empire. It lies with the United States to prevent a repetition of that history. She owes England a heavy debt of gratitude for her attitude during the Spanish War. Now is a golden opportunity to pay the debt. In short, let America say to England: "Go ahead and take such measures as you think best to establish order in Macedonia. If any Power but Turkey attacks you, count on me to come to your side." The simple knowledge that such an agreement existed would prevent any need of carrying it into operation. The sole result would be that England would be given a commanding position in the European "Concert," and the other Powers would hasten to adopt her suggestions and co-operate with her in carrying them out, lest she get too great an influence over Turkey by doing it alone. That this would be the result is the opinion of every Englishman and American on the scene of disturbances. Of course, America must be ready to back her promise by force if necessary. But her very readiness would make it unnecessary.

Hence I contend that the American conscience should be moved by the Macedonian cry of to-day, since it is entirely in America's power, without taking any rash step, and without firing a gun, to grant the relief for which that cry pleads.

TURKEY.

My Evolution Theory

BY ANNA TEMPLE WHITNEY

I do believe with all my heart
That dogs as little puppies start.
That tiny kittens cats will make
If they the proper method take.

That eggs change into cock or hen,
And baby-boys turn into men.
And apes now swinging on the trees
Had parent apes for centuries.

But oh, confusion worse confounded!
This theory wise men have sounded:
That dog and cat and cock and hen,
And little apes and great big men,

Were all one time mixed up together,
And knew not which was which, nor whether
The dog would be a crowing hen,
Or man an ape, or apes be men.

BRYN MAWR, PA.

The Discoverer of Radium: Madame Curie at Home

BY MADAME J. W. BIENSTOCK

[Madame Bienstock, who is a graduate of the Woman's Superior Normal School at Sèvres, near Paris, where Madame Curie is one of the professors, has held the chair of Physical and Natural Sciences at the Girls' College of Tours, and now—tho on leave of absence—fills the same post in one of the girls' colleges of the city of Paris. To her statement about Madame Curie's thesis for the doctorate of philosophy may be added the fact that from this thesis was made up the interesting article credited to her published by THE INDEPENDENT of June 25.—EDITOR.]

MADAME SKLODOWSKA-CURIE, the learned discoverer of radium, lives in the suburbs of Paris, far from the center of the great city. Of course, I do not refer to the fashionable center, to the Boulevards and the Opera, but to the University center, to the Sorbonne and the grand special schools. Just outside the walls of the capital, in a little one-story house, are to be found Monsieur and Madame Curie.

I called there recently, and it was Madame Curie herself who opened the door when I rang, and who led me right into

her study. A writing table, two rather hard armchairs, two others with straw bottoms, a couple of bookcases with glass doors through which you could see volumes, papers and vials thrown together pellmell, an iron stove in the middle of the room—such is the furnishing of this plain study, where curtains, rugs and hangings are conspicuous by their absence. In fact, the whole little abode is furnished in this same simple fashion. You quickly perceive that you are in a spot where no thought is given to material comforts, and whose inmates are

wholly wrapped up in their studies, with neither the time nor the means to consider useless things.

The mistress of the house is as simple in her attire as is the furniture. You perceive this at the first glance. Her dress is so plain that nothing can be said about it. No thought has been given as to how it fits. It is evident that all attempt at what the English call smartness is quite foreign to this soul. And yet nature has adorned Madame Curie with certain charms that more than one elegant Parisienne might envy. She is tall, well proportioned, with magnificent light yellow delicate wavy hair, which harmoniously frames a fine straight forehead. The features of her face are fine and regular; the eyes a light blue, very expressive and soft; the mouth alone, with its thin lips, giving a slight touch of hardness to the expression of the physiognomy. But whatever hardness is there quickly disappears when Madame Curie speaks and becomes animated in conversation.

Madame Curie, who is now thirty-six years old, was born in Warsaw. Her early education was acquired at the high school of her native city. On leaving school, as her parents were not rich, she tried to earn a little money by giving lessons to small children. But this thankless task did not satisfy the young woman, in whom a thirst for higher things soon began to show itself. Instead of teaching others, she longed to study and learn herself. The vision of going to the University began to haunt her. But Russia does not encourage the intellectual development of women and shuts the doors of her universities to them. So Russian girls who wish to complete their studies must go forth to foreign lands, to Germany and Switzerland, and especially to France.

It is easy to imagine the difficulties of all sorts which now stared this young woman in the face, particularly as she was almost penniless. But youth is brave and sanguine, especially when the aim is a noble one. So at the age of twenty Mademoiselle Sklodowska started for Paris. She has told me the story of her first year at the French University. She first obtained permission to try for the degree of master of sciences. She

still has vividly before her the material hardships of her student life at that time, and the anxieties that beset her on all sides. She was never sure of where next day's meal was to come from, but forgot all in the joy of acquiring new knowledge.

During this arduous period of post-graduate study an unexpected and important change occurred in the prospects of the young student, who, till then, was wholly absorbed in her work. Mademoiselle Sklodowska found herself making experiments in the chemical laboratory side by side with a young man who had already attracted the attention of his professors, who saw in him the promise of a remarkable scientist. This young man, Pierre Curie, began to take a sincere interest in the young woman by his side. He gave her the advantage of his wider experience in study and in life. They spent many hours each week working at the same table. In a word, study brought them together, and love united them. When Monsieur Curie, after some brilliant scientific labors, obtained a professorship, which gave him a modest income, he married Mademoiselle Sklodowska.

Monsieur Pierre Curie, who is to-day one of the professors in the Paris School of Industrial Physics and Chemistry, is as simple and as modest as his wife, who, since their marriage, has been associated with him in all his scientific work. I may even say that they are not without a certain physical resemblance. Monsieur Curie is tall, slender, blond, with dark blue eyes, which light up a frank, pleasing face.

At the start, the material situation of the young couple was not very bright. Neither had any fortune, and with the few thousand francs which they earned it was no easy task to make both ends meet at the close of the year in such an expensive city as Paris. So they went out into the suburbs of the great capital, and established themselves in the little town of Bourg-la-Reine, distant two or three miles from the walls; and in order to save the railway fare, husband and wife, in all weathers and at all hours, made the journey by bicycle from their modest lodgings to their laboratory in the dingy old Rue Lhomond, where they

have made their important discoveries. When it is known that the highway from Bourg-la-Reine to Paris is paved much of the distance and incumbered in many ways, these goings and comings on "the wheel" were not holiday rides, especially in the case of the frail, young wife.

Soon a child came to the struggling couple. The little daughter is now seven years old, a dear, small blonde, in good

mittee of the Sorbonne for her degree of Doctor of Sciences. This body, composed of such men as Professors Lippmann, the geologist; Bouty, the physicist, and Moissan, the chemist, awarded her the degree with the warmest expressions of congratulation on the able way in which she defended her thesis.

This thesis was devoted to a presentation of Madame Curie's labors and re-

Madame Curie and Four of her Students of the Women's Superior Normal School, at Sevres.
The Photograph was Taken by Another of her Students

health, full of life and tenderly cared for by the loving mother. So Madame Curie is not only a scientist, whose name is well known throughout the world, but a model wife and mother, another and most striking example of the fact that the new woman does not differ in this respect materially from her often more pretentious sister.

Last summer Madame Curie appeared before the distinguished examining com-

searches concerning radio-active bodies, and fully proved that an astonishing force has been suddenly discovered in nature—a force more wonderful than the X rays. These facts being satisfactorily established, Madame Curie took up the examination of the rays emitted by the radio-active substances as regards the action exercised on them by the magnetic field or induced radio-activity. But I do not dwell on this second part of Ma-

dame Curie's thesis, which, as she herself admits, attempts little more than to hint at what future research may accomplish. She means soon to take up this work, and she hopes in a year's time to have completed the study of this portion of her thesis. Full of faith and courage, Madame Curie, after three months of well-earned rest, will resume her labors in her husband's laboratory and assume once more her professorial duties at Sèvres.

The Superior Normal School at Sèvres, on the Seine near Paris, is a state institution, where, after a competitive examination, young women are admitted who, on graduation, are given places in the girls' colleges. This school does for young women what the famous Normal in the Rue d'Ulm, Paris, does for young men. In order to take part in the competitive entrance examination candidates must already have taken their bachelor's degree, or an equivalent to it. The number of new students admitted each year is very small—four or five for the sciences and eight to ten in letters. The faculty is made up of the most distinguished professors of France—such men as Darboux for higher geometry, Appell for rational mechanics, Poincaré for physics, Perrier for the natural sciences, Van Tieghem for botany, Tannery for the general sciences, Gernez for chemistry, etc., while the professors for letters are not less celebrated. Such is the school and such the body of professors with which Madame Curie is associated. But I anticipate a little.

In order that a woman may have a chair in a girls' college, and especially in those of Paris, she must have passed the very difficult competitive examination known as the "*agrégation*." So when Madame Curie, who already held the master's degree in mathematics and the physical sciences and had already done special scientific work of recognized importance, wished to secure a position in one of the girls' colleges, she was met with the objection that she had not passed the *agrégation*. Nothing daunted, she set to work to prepare for this examination in the department of mathematical sciences, and was received with honors in 1900. Madame Curie was now an "*agrégée*." And the reward she was to

receive for this effort was much greater than she could have hoped for even in her most sanguine mood. Instead of a chair in a simple girls' college, she was to be given a post in the highest of all the state institutions for women and to become the colleague of the leading professors of the University of Paris. She was to enter the Sèvres school as a teacher.

In 1900, the very year Madame Curie passed her last examination, Monsieur Poincaré, who filled the post of physics at Sèvres, was chosen rector of one of the French universities. Thereupon, Madame Curie was given an appointment never known before in the history of the school. She was placed in charge of the courses in physics leading up to the degree which opens to its possessors the professorships in the women's colleges. When this nomination became known at Sèvres, consternation reigned for a moment at the school. Never, until then, had a woman held a full professorship, except in modern languages. But here was a woman who was expected to teach one of the most difficult branches of science, and who was to succeed one of the most eminent men of science of whom France can boast. Would she be equal to the occasion? everybody asked in the quiet study halls of Sèvres. She was without doubt very learned, but she was a woman and a foreigner besides. Nor had she risen step by step from the lower to the higher posts, but at one bound was placed on the top round of the professorial ladder. But this feeling of mistrust soon disappeared when the new professor was seen at her task. Madame Curie quickly convinced even the most skeptical that she was in her right place. Her students now feel the greatest admiration for her learning and the sincerest esteem for her personality.

Such was the report that was made to me when I revisited my old school home the other day in connection with the preparation of this little article. And when I sat last week with Madame Curie in her study, I completed the report by learning what the teacher thought of the pupils. She is delighted with the school and the students. She says that it is with real pleasure that she goes down to Sèvres twice each week. She is much

attached to her students. Her only regret is that they are so few—five in the first year and four in the second. Her lectures for Sèvres require long and care-

ful preparation, and it seems a pity that such a small number of students profit by them.

PARIS, FRANCE.

Madame Curie in her Own Garden. From Photograph Taken by her Husband

Autobiography of a Football Player

[Every year at the end of the season the football critics select the eleven supposedly best players from the colleges of the country to form what they call "The All American Team." Theoretically these players are chosen from any of the colleges in the land, but as a matter of fact Harvard, Yale and Princeton generally make up nearly the entire list. The following article was given in an interview for THE INDEPENDENT by a member of last season's "All American Team"—the unqualified choice of all the critics.—EDITOR.]

WHEN I was a boy of ten or twelve years I began to play football. I played in a small yard with other small boys, and tho we were ignorant of rules and deficient in science we knew something of football traditions, and, clad in sweaters and wearing improvised armor, we ran about the arena or wallowed on the sod most bravely.

Soon after I was twelve years old I was sent to a small academy in Massachusetts, where they had a team composed of the larger boys who played against other teams of similar schools. It was a good team as far as it went, and had the respect of us small boys, who carried water for the struggling heroes;

but it didn't live up to the extreme rigor of the game. It omitted practice on account of rain, there was no strict training, and no one cared very much whether the school won or lost. In fact, at this school football was treated as an ordinary amusement instead of being made an end in life. If a fellow made a bad play the thought of it did not torture him so that he would want to go and die. Football here was classed with golf and tennis.

We small boys admired the members of the football team in this school, but we felt that they were of our own clay and human. Not so was our attitude toward the members of the teams of the

great colleges to which we were going. In our imaginations those giant figures seen afar off loomed as demi-gods; we never for a moment doubted that Beecher, the Traffords, the Poes, and their like were superhuman. This feeling lasted till we actually reached college and came in contact with our heroes. Sometimes it lasted even longer.

After I had attended the little school for two years I was sent to one of the great preparatory schools, where they had a splendid football team which played matches with the best schools of the vicinity, sometimes going as far as fifty miles for a match. During my first year I only played on the second eleven, yet they carried me around as a substitute, so that I had all the fun and excitement of the matches without the anxiety of the actual player.

Next season, however, I was put on the big team, and I shall never forget what happened to me the day after I played my first game. It was at once apparent to me that I had become a different man in the estimation of my schoolmates. I was pointed out as I walked across the yard, and was even cheered as I entered the class room. I began to taste the intoxication of fame. I soon found that practicing with such a team that makes work of sport was very different from anything I had experienced on the academy team. The sense of responsibility was oppressive, and I knew what it was to lie awake worrying over my own deficiencies and those of the team, in which the honor of the school was involved.

Besides, life during the training season was slavery. It was work from morning till night, and the restrictions were very annoying. All our afternoons were given over to field practice, and all our evenings to running through signals, tackling the dummy, and so forth, on the floor of the gymnasium.

In addition to this we had to keep up with our studies and attend recitations in the mornings, so that as we were obliged to go to bed at ten o'clock there was hardly a minute of the entire day that we could call our own.

Membership in that school team was a great honor, but it had its drawbacks.

People of no football experience re-

gard the matches as the hard features of the players' season, but that is a mistake.

I was never hurt in any of the matches in which I participated while at this school. That is to say, I received no injury that laid me up. I got bumped at times, and was sore in places for a day, and once I received a muscle bruise that kept me from play for two days, but such things don't count. I never wore a nose guard in any of these matches.

The school teams that we played against were all decent and fair; there was no foul play, but a fair struggle of the men on their physical merits, with "May the best men win" the prevailing sentiment.

Football, under any circumstances, is a fierce game, and no matter how fair players are injuries are liable to come. Every man who plays at the colleges and big schools loses five or six days out of a season on account of petty injuries, and by the end of the season two or three men out of the thirty who comprise the team and its supports are pretty well "bunged up," but tho I have been following football for many years there never was a man permanently injured while playing on any of the teams of which I was a member. The worst that ever happened to any of my comrades was a strained knee, putting him out for a season. But football is above all a game of personal encounter, and as long as this is the case—and it would not be football without it—there will always be more or less physical danger connected with the sport.

From the large school of which I have spoken I then went to college, which I reached at the age of eighteen. I was a big, husky, heavy limbed fellow, one of several hundred freshmen. I was not entirely a stranger, because my fame had preceded me from the preparatory school, and some of the boys of the school I had just been attending came on with me. I might parenthetically add, however, that several of the smaller colleges had already asked me to come to them, and offered me all kinds of inducements except money.

A few days after arriving at the college the newspaper of the institution invited all freshmen who desired to try for

places on the football team to present themselves to be tried out. I was one of about a hundred freshmen who answered this call for candidates.

We went to a part of the football field and there were taken in hand by two coaches appointed by the captain of the 'Varsity team. These coaches were experienced men. They took in our points very fast; in fact, could tell a good deal about us by our general appearance. They are generally graduates working for love of their alma mater.

The first day we practiced falling on the ball, the coach dribbling the ball along the ground and calling on a man to show how well he could fall on it. The coach superintended the operation very closely, rebuking any lapses of art, speed or vigor, and showing the correct style—for the coach is always one who in his day has been a "crack."

Falling on the ball may, to the outsider, seem a very simple thing, but it is not quite so easy as it looks. There is art in learning how to fall without hurting one's self. It has to be done quickly under exciting circumstances, and the clutch on the ball has to be sure. Some men never can learn how to fall on the ball, just as some men never can learn how to dive.

After a day or two of drill in falling on the ball we were set to tackling the dummy. The dummy is a suspended stuffed figure of the size, weight and shape of a man. The player rushes at it, seizes it and throws it down, just as if it was a running opponent. This is about as good practice as tackling a real man; and, of course, tackling a real man is hard on the man tackled, as he gets heavy falls. So the dummy suffers in his stead.

After four or five days of this preliminary work the coaches had come to some conclusions about the men as material, and having picked out a freshman team began making us run through signals.

These signals are given by the quarterback, calling out numbers like 7-14-12, 3-11-9, etc. The variety of these signal systems is infinite. They are arbitrary, and the secret of them is known only to the coaches and the players. At the call of, say, 9-8-4, the play which that represents is made, and by making it often thus in practice the men engaged in the

movement reach a certainty and swiftness and massed strength that cannot be obtained in any other way, and are very effective against an enemy who does not understand what is coming. Of course, in this preliminary work there was no opposition to the execution of our maneuvers, and this made it much easier for us.

In the fullness of time I got a place on the freshman team, tho I had not as yet shown any football genius.

I had never been really ambitious, but rather a humble minded follower of football; in my wildest dreams it never had dawned on me that I might one day be selected to play on the 'Varsity. In my eyes the 'Varsity men were still superhuman, and I was awestricken in their presence. I did not for a moment imagine that I could withstand one of these heroes.

This spirit gave me a setback that might have had serious effects on my future, for one day I was called upon to go in as a substitute, and match my force against that of the great ones. I was afraid to try my best, for fear of breaking some rule and angering them. Practically I let them do as they liked with me, because I thought that with all their great experience they must know what was right. The consequence was that never again during that season was I called in to play with the 'Varsity, and for a long time I never knew the reason.

Meanwhile, I took part in the matches of the freshmen. As long as we played against other colleges all was well, but one time our opponents were members of the Young Men's Christian Association, and then we found a great change.

Our match with these young men took place in a Connecticut city of about 10,000 inhabitants that was fairly bursting with local pride or vanity.

We had traveled far to play the match, and we were very kindly treated by our opponents and their friends at the Young Men's Christian Association building before the play began. They seemed very pleasant, decent fellows.

But on the football field a marked alteration was seen. The people were bitterly hostile to us. They wanted to see the local men win, no matter how, and leading them on was the Mayor and all the city officials. The players partici-

pated in this spirit, and we soon found that we were in the hands of the Philistines. Both referee and umpire were local men, and while keen to catch us violating rules so as to put us off the field, they allowed their own players to commit all sorts of rule violations. It was a very nasty experience for us. The young Christians standing opposite us assailed us with foul names, tempting us to strike them, so that we could be ruled out. They slugged, they kicked and committed all sorts of fouls, and finally wound up by seizing the ball which we had fairly gained on a touchdown, running with it, and making a touchdown themselves.

We protested; but the crowd was howling for our blood, and the referee ruled against us. A little later time was called, and we were declared defeated. As soon as we returned to the Young Men's Christian Association building our opponents were as sweet as ever.

In the following spring I went out for spring practice.

During the succeeding fall I received from the captain of the 'Varsity a circular note, asking me to get back to college early so as to try for the 'Varsity team. I knew that I was one of many to receive such invitations, and I had little hope of success. Still I turned up at the appointed time, and spent a week getting toughened by falling on the ball, tackling the dummy, etc.

One of the coaches gave me a tip to the effect that the coaches generally were prejudiced against me, because it was thought that I had made a "sandless exhibition" at the time when I was called into play in the 'Varsity field. This was hint enough, and I could see where I had made a mistake. Luckily when I had an opportunity to redeem myself I was lined up against a 'Varsity man, who was not an overstrong player, and when I found that I could hold him even, it gave me a great deal of confidence.

I soon found that I had to play hard, and I did play hard. A man can't stop to be polite in football.

The coaches were very different in their methods. Some were great drivers, whipping the men with their tongues, and dispensing opprobrium that is as brutal as it is, to nineteen men out of twenty, ineffectual—for instance, telling a play-

er that he was "quitting;" others were quiet and civil, never abusing the men, but trying to make them use their wits to play a "heady" game. Some told us how to evade the rules; how, for instance, to hold a man unseen by the umpire.

I don't think there is much foul play in the big games now. I know that, fine as my opportunities were, I saw little of it. Of course, there is rough tackling, and men are thrown heavily, but that is allowed by the rules. There used to be a trick by means of which when one of the backs was kicking for goal, three or four of the opponents made a dash through the line and threw him heavily. The result of that was to make him nervous. Next time he went to kick at goal he would be thinking more of the men who were to fall on him than of the drop kick he was to make. It was a good trick, but the new rules have wiped it out.

After the usual preliminaries I was, much to my surprise, actually appointed to a place on the 'Varsity team. Then the serious business of life began. I had to go to the training table, and came under the despotic authority of the manager of that institution.

All smoking and drinking had to be given up, except such drinking as might be prescribed by the manager, an old and most experienced coach, who watched us with the utmost vigilance and austerity. Most of the men were cut entirely off from ales, wines, beers and alcoholic liquors, but there were exceptions. Some were advised to drink ale for their appetites, and in my case they gave me whiskey in ginger ale. Once in a great while some player is given champagne. Of course, no one is forced to drink against his principles.

The food is plain, but of the very best; beef is the staple, and steaks and chops in great demand. We could have pretty nearly anything we wanted with the exception of pastry. We were allowed tea and coffee. Toast took the place of bread, and we had fruit to any extent.

But we were under orders all the time, and we could not eat as much as we wanted for lunch. We could eat heartily as we liked at breakfast and dinner, but for lunch we were on short allowance, as the struggle in the football field could not be entered upon just after we had eaten heartily.

Saturday nights this rigor slackened off, as we had all day Sunday in which to recover any tone lost by feasting, so we were allowed to have a regular *table d'hôte* dinner, beginning with oysters and ending with ice cream.

The 'Varsity games are on an ascending scale. Our first trials each season are against teams from the smaller colleges, which, we think, we can easily defeat. At this period the team is not yet determined upon. Some of the men have only been chosen tentatively, and may be removed for cause seen by the captain without the benefit of any civil service rules. As the season advances the games grow harder and harder, and the team solidifies.

Yet the games which I felt to be most severe have been those which came earliest in the season, before I became toughened and while the weather was still hot. By the time that the real big games arrived we were all in such condition that we were never out of wind, and at the game's end could have gone on playing about as well as ever.

In practice and in all the early games we wore protective armor and nose guards, but we stripped for the big battles, being contented to risk a broken nose and a few injuries if we could increase our speed. We took much of the padding out of our trousers and wore lighter shoes.

I was in all the big games of two seasons, and had all the ordinary experiences of a man in such position, and what I found hardest of all was not playing, but waiting.

There comes now and then a moment when the other side has the ball on the thirty-yard line, and is kicking at your goal, and by the rules you have to wait in crouching expectancy for the ball to be put in play. If your opponent takes his time it is misery—supreme, helpless misery.

The qualities of a football player vary with the position to which he is assigned. The center and two guards should each weigh about 200 pounds or more. They should be six footers, broad shouldered and deep chested. What is required is that they shall be strong, so that they can push hard, and will have the weight to back it. The center should be cool

and good at guessing what the other side are about to do. The tackles and ends should be selected chiefly for speed and tackling ability.

For a quarterback the essentials are speed and quickness of mind and body. He must be able to run fast and to dodge well. Of course, he must have courage, be able to tackle effectively, and have all the qualities of a general perceiving the weakest spot in the enemy's line, and taking advantage of any mistakes made by his opponents. The quarterback should weigh about 150 pounds.

For fullbacks the coaches get the heaviest men possible without sacrificing speed. They generally weigh from 170 to 180 pounds. The halfbacks are lighter.

Football has not hurt me, and I doubt if it has hurt the colleges. It is a strenuous and most engrossing game, and when the season is on the men of the team are quite likely to have so much on their minds that their studies do not get the attention they would ordinarily receive. The body is so tired and the nerves so prostrated that it is generally a physical impossibility to turn one's faculties to study between the practice hour and bedtime. But, on the other hand, the football season is short, and the game and its traditions are vigorous and healthy. Football tends to keep men from other evils, which might include smoking, drinking, gambling and dissipation.

Before closing it may be interesting to note some of the side incidents of football, such as being interviewed by reporters, invitations to make speeches at Young Men's Christian Associations and public dinners, and feminine adulation, which frequently takes the form of letters written by unknown sentimental young ladies, and general all around college idolatry. But, after all is said, I freely acknowledge that football, as now played, is no longer a recreation. It cannot be played for the pure fun of playing. The game is too hard, and we players are always thankful when the umpire blows his last whistle at the end of the season. But our sacrifices are worth all they cost, for we have fame and the emoluments of fame. And is not fame, when it is honorable and deserved, considered by all men one of the greatest prizes in life?

Phillip Slevin's Queer Courting^{*}

BY SEUMAS MACMANUS

AUTHOR OF "THROUGH THE TURF SMOKE," "THE BEND OF THE ROAD," ETC.

FOR all Phillip Slevin was a fine, and fine-looking, fellow, and a brave and a courageous one, too—among boys—he at length discovered to himself that he was the veriest coward before one little girl. The little girl was Mary M'Entee—a black-haired, blue-eyed, and certainly winsome enough looking lassie, and a neighbor of his own, moreover, with whom he had been on the most familiar terms since the time that both of them were called "no hight at all, at all." When at length he awaked—so to speak—one harvest to find that he was sadly and badly in love with Mary, and that he should like to tell her so, and that he should like to court her for a wife, all the courage at once left him, and, despite the great conceit he hitherto had had in himself, he found that, after all, he was the most pitiful and contemptible creature in creation, and hadn't the nerve of a weeshy wee mouse.

As formerly, he could meet little Mary and chat with her on any and every subject under the sun except the one that was uppermost in his heart, and, in fact, sticking in his throat and choking him, struggling to get out. Had he had any manly instincts about him, as he often remarked to himself, he should have found no difficulty in approaching Mary on such a subject, inasmuch as, by all signs and tokens, her affections weren't pre-engaged—at least Phillip felt confident they were not pre-engaged; tho if he had only known it, which he didn't, there were cute people in the parish who could hint otherwise. Among all the girls of the parish, every one of whom had a boy, and boys, and still boys to spare, Mary, alone, winsome and pretty as she was, didn't court with any; but, indeed, altho we knew it not, maybe this was the very thing that daunted Phillip most. If there had been a rival, or rivals, against whom he would need to take the field, I do believe his courage would have rallied to his support and spurred him to success. As it was, however, poor Phillip sighed in solitude, dallied and delayed, and, figuratively speaking,

kicked himself for a coward twice 'round the earth's orbit, while still Mary courted with no boy, and still he feared to pay her court. And, at the end of two years, having grown desperate, he resolved to punish himself by exile, so early on a Monday morning he traveled the hills into Donegal town, and took his passage to sail for America from the port of Derry ten days later. And who in the parish wasn't sorry when the news ran like a moor fire that Phillip Slevin was about to show them his heels? None.

Now it was October when the nightly devotions usual in that month, and to which the boys and girls, young and old, thronged, were held in the Chapel. Father Ned, the warm-hearted but eccentric priest, took a deep, personal interest in his flock and zealously and jealously guided their footsteps on the narrow path on which they should tread, never hesitating even to use his good, stout staff when necessary, to drive them into that path and to keep them there. Father Ned had an eye that could see round a corner, and he used to say that with such people to look after he sorely needed such a power, "For there are more winds and twists in them," he would pathetically add, "than in the Ainey River."

One abuse in particular against which, periodically, he was won't to use both sermon and stick—use them vainly, tho—was that of courting without serious intent. And, after the Rosary on one of these October evenings—when Phillip Slevin had just had his passage a few days taken—Father Ned mounted the altar and inveighed against it again, sorely and sorely; in particular pitching into the girls of the parish at a furious rate, expressing his opinion that they would court a pair of trousers on a stick; while, as for the boys, he told the congregation it was a well-known fact that the boys used to boast it was never the girl they courted that they would marry. While he had the charge and the care of them, he said, he wouldn't tolerate it that any girl's name in the parish should be coupled with that of a boy who might, after a twelvemonths' courting, suddenly lead a bride past her door in

^{*} Copyright, 1903, by THE INDEPENDENT, and also copyrighted in Great Britain and Ireland.

the morning; and that if a girl was to be courted it had got to be done at her father's fireside. He let the girls and boys know, without any mincing of words, that he would thrash, within an inch of his life, any boy who courted along the roads; that if a girl got a little taste of a stick, too, she would only have herself to blame; that, in particular, they weren't to go and come in couples to and from the October Rosary; that he would watch out and lie in wait for such, and after they had got clear of his hands he'd wish them luck.

As you may well suppose, the girls and boys of Knockagar felt by no means happy under the lash of Father Ned's sarcasm; for that conscience which doth make cowards of us all made every one of them writhe as they knelt there on the hard floor, with his jokes and his scornful words dropping on them like bombshells. I said every one of them writhed, but this was wrong. There were two young people in the chapel who did not writhe; but, true to that instinct of poor human nature that makes us pleased with the discomfiture of others, more especially when that discomfiture might have been ours, but by accident is not, keenly enjoyed the sore castigation which their less fortunate brothers and sisters were receiving. One of these two was Mary M'Entee, who was knelt close to the altar, and the other was Phillip Slevin, who was knelt by the door. As affliction draws mortals together, so does gratification; as they went from the Chapel, by the Brably Road, Phillip, smiling at his downcast fellows, who had not even the courage to return him a look of defiance, beheld Mary, and drew to her, and, as he stepped out by her side, called her attention to the fact that, for once in their lives anyhow, the courting couples were on this night separated; the abashed girls gliding along by themselves and the boys keeping by themselves also. Mary was smiling amusedly at the whole thing; then, observing and criticising the poor shamed boys and girls that passed them, they walked along in good humor with themselves over the event. But soon a sentence that Phillip spoke was abruptly broken short in the middle, and poor Mary, startled and frightened by hearing him suddenly ejaculate "Oh, good Lord!" turned round in time to ob-

serve Phillip drag his shoulder from out of Father Ned's grasp and spring away from the slash of a descending staff.

"Ho! Ho! Ho! ye disobedient reprobate," shouted Father Ned, as he sprang after him. "Let me get a hold of ye." But Phillip, with his heart in his mouth as he sped along the road, had no desire to obey this request; for he knew Father Ned of old, and he knew well that just now his reverence was in no mood for chopping logic or listening to cold reason. The wings that fear is said to give to one's heels soon carried him out of the reach of Father Ned, who, after pausing at length to shake his stick and send a vengeful vow after him, returned to have it out with Mary. But, behold ye, when Father Ned came back, Mary, too, thinking discretion the better part of valor, had disappeared!

After mass on the Sunday following Father Ned, who was in an angrier mood than the congregation had beheld for a month of Sundays before, reverted again to the matter of the boys and girls courting, despite all his discourse and warning on the subject just three nights before, and to the fact—a fact that made his voice pregnant with dread portent as he related it—that immediately on quitting the Chapel that night a certain young man and a certain young woman, both of whom he could now see in the congregation, struck up together and went along courting as light heartedly as if he had just given it his blessing.

Poor Mary, who on this day had come to mass filled with fear and trepidation, had taken care to kneel in a remote corner, but, as Father Ned proceeded, she, poor girl, seemed to feel that every eye in the congregation was fixed on her. She hung her head, she blushed most painfully, and finally the tears came chasing each other down her cheeks and fell on the floor, giving sound—so it seemed to her—like the big drum of Tullyard, when Phaudrig Mor swung the sticks. Poor Mary heard, or understood, little more of Father Ned's discourse than I have recorded, until before he came down off the altar again he announced that he wanted the couple to whom he referred to come to him within twenty-four hours' time, till he would discourse them.

There and then Mary, plucking up a

desperate courage, resolved she would do what she should have done at first—go to him immediately and explain her innocence and Phillip's. Accordingly, when mass was over and having still knelt in the remote corner till almost all the congregation had gone, she got up and went out of the east door, and around the Chapel to the Sacristy, where she would intercept Father Ned as soon as he had disrobed and would clear herself in his eyes. When she got as far as the Sacristy door, however, she felt that her eyes were still too red from weeping, so instead of going in direct she passed to the other side of the shrubbery clump which stood in front of the Sacristy door and window, sheltering it—to the spot where the old women who wanted offices read or confessions heard used to come before mass and exchange the gossip of their townlands while they awaited the arrival of Father Ned at the Sacristy—and here stood to air her eyes and muster her courage.

By a peculiar coincidence, the minute after Mary had left the east door Phillip Slevin, who in his own way had suffered during Father Ned's discourse as much as she in hers, quitted the west door with the very same resolve in his mind—to explain to Father Ned his complete innocence without another minute's delay. When he reached the Sacristy door he found it necessary to go round the shrubbery clump, that he might draw a long breath and recruit the courage that seemed already slipping him. And when Mary, hearing a foot, looked up and saw Phillip, with his pale face and the frightened look in his eyes, and knew that he was on the same errand as herself, and thought of how he had come round the clump for almost the same purpose, she couldn't—despite her own grief and mortification—restrain a smile that played all over her features, and then developed into a little ringing laugh. When Phillip suddenly saw Mary he gasped, next moment he took in the whole situation, and Mary's laugh made him laugh also.

"Phillip," said Mary, then, "it is sore the heart is in me; but, when I seen the look you had in your face—seen you were as bad as I am, and worse—and

that both of us were on the self same errand, sure I couldn't help myself but laugh at the comicality of it"—and still fronting each other, both of them laughed again. Phillip was so overcome that he had to put his hands to his knees to do so. In a twinkling his laugh twisted off into a scream, for he felt himself taken by the collar in a firm grip, and he saw a big hand grip also the arm of a suddenly-silenced, spell-bound, Mary. "Aye!" said Father Ned; "Ay! at it again, outside the very door of my Sacristy, and breaking their hearts laughing at me for my trouble!" As he spoke the priest shook the collared Phillip till the teeth rattled in the poor fellow's head, and then he led both of them forth speechless, and under the gaze of the several old women who, having delayed to fill their holy water bottles, were now only gossiping their way across the Chapel yard, turning their faces for home—led both of them forth thus, speechless, and under the gaze of these old women, and into the Sacristy. He never relaxed his grip on Phillip's collar or on Mary's arm.

"Phillip Slevin," Father Ned said, in awful tones, "is it, or is it not, your intention to marry this girl?"

His speech instantly returned to Phillip, and with it an accession of something or other that was probably desperation rather than courage. He looked Father Ned in the face, and he said, "Marry her? Ay, and a hundred thousand welcomes if I only thought she would take the likes of me." The murder was out.

"And you, madam," said Father Ned, sternly, "whether would you sooner marry or be named off the altar?"

Mary raised her head slightly, and looked shyly up at the priest. "I think, Father Ned," she said, "I would rather marry—Phillip."

The amount of undue emphasis which she placed upon the last word was probably too slight to be detected by a casual listener, still it was enough to make Phillip's heart thump in his bosom.

At their father's expense, Mary nowadays occasionally tells the story to her daughters. But poor Phillip laughs as heartily at it as any of them.

ST. CHARLES, DONEGAL COUNTY, IRELAND

Literature

Mr. Yeats's Recent Writings*

MR. W. B. YEATS commands a very pretty prose. In general it is as easy, simple and expressive as any one would care to read. But every now and then it seems to trouble, and you begin to see its turbid and opalescent surface mantle with strange shadows, illusory and undefined, and yet vaguely suggestive, "like a half-faded curtain embroidered with kings and queens, their loves and battles and their days out hunting, or else with holy letters and images of so great antiquity that nobody can tell the god or goddess they would commend to an unfading memory."

For Mr. Yeats's work as a whole and for the movement of which he is a representative the significance of such passages, however occasional, is not to be overlooked; and in the first article of his *Ideas of Good and Evil* he himself has unriddled their secret. All poetry, he says there, consists in the consciousness of tradition, whether written or unwritten. But this tradition of Mr. Yeats's is evidently of a peculiar kind. Indeed, it is not so much what most of us in a plain way of life would call tradition at all, as the resurgence of such *débris* and wreckage of prenatal experience as have become dislodged in some way from the bottom and floated up through intervening strata of consciousness to the light, all ghostly and startling in the moment of resurrection, with the evidences of their long, unfathomable submergence still clinging about them. In other words, it is a sort of retrospective *Ahnung* or misgiving, a boding backward to that other great forgotten eternity behind us. For this reason, declares Mr. Yeats, genuine poetry is always "strange and obscure, and unreal to all who have not understanding," and, "instead of that manifest logic, that clear rhetoric of the 'popular poetry,' glimmer[s] with

thoughts and images whose 'ancestors were stout and wise,' 'anigh to paradise' 'ere yet men knew the gift of corn.'"

Of these things which stir obscurely, like little Enceladus's, below the consciousness of self and which, as the poet of his own race and its revival, he would like to take up into literature, Mr. Yeats has made a very curious and interesting collection in *The Celtic Twilight*. Perhaps what strikes a critical reader most

W. B. YEATS

strongly in the traditions mirrored in these imaginings is their childishness, their moral irresponsibility, as compared with the deeply human significance of the traditions which have gone to make up every great original literature. There was something more momentous than the mischief of tricky sprites behind the Greek drama—there was something more behind the romantic Celtic literature of the Middle Ages, or it had never laid hold of all Europe.

If now one turns from this criticism and this collection of crude material to

* IDEAS OF GOOD AND EVIL: \$1.50. THE CELTIC TWILIGHT: \$1.50. WHERE THERE IS NOTHING: \$1.25. IN THE SEVEN WOODS: \$1.00. New York: The Macmillan Co.

Mr. Yeats's recent literary use and application of them, one will have, it seems to us, a very practical test of their inadequacy. It is not singular that a spirit with Mr. Yeats's bent should prefer suggestion to expression. But the practical difficulty with this kind of suggestion is that it is unrepresentable, that it affords no ground for representation to inhere in and simply introduces trouble and confusion into the art which attempts to represent it. For either a work of art must be "neat, finite, self-contained, and rational," in which case it cuts off suggestion entirely; or else it must be content to remain more or less vague, formless and inane. And such we find Mr. Yeats's work to be in every case where he has tried to catch his traditional will-o'-the-wisp. So it was with his "Shadowy Waters" and "Land of the Heart's Desire." And so it is with *In the Seven Woods*, where the frequent felicity of his verses cannot altogether disguise the vacuity of his figures, and, above all, with *Where There Is Nothing*, which seems to us little better than nonsense.

In short, this is not the kind of thing that one would write if reason were on her seat keeping balance among the faculties. And tho we say so with assurance, we say so with reluctance too, because we were very favorably impressed with some of Mr. Yeats's earlier work. That one's mind should become subdued to what it works in is nothing strange, and after what has passed it will not astonish the reader to find him professing a faith in things that are not generally believed in nowadays by the enlightened, in symbols and magic, and quoting copiously the poets of the vague, Blake, Shelley and Rossetti. Indeed, it begins to look a little as tho his writings were hypnotized, as it were, by force of a fixed idea, rather than inspired by natural enthusiasm. And it is just such considerations as these which make us suspect that the Irish Revival is nothing after all but another form of decadence, no spontaneous movement but an abuse of spirit, like mysticism and symbolism, which it resembles strikingly by its attempt to claim for the irrational a large portion in literature. Oh, how woful the need—were this a text to preach on—of some principle of authority in life and literature to-day!

Variation in Animals and Plants

THE existence of variability in plants and animals is, of course, essential and fundamental for any process of evolution. This has long been clearly recognized, and the observations made by Darwin and others have been the basis of much speculative inquiry. In recent years much more attention has been paid to this aspect of the question and a considerable amount of material has been collected by many observers. Dr. Vernon, himself an active worker along these lines, has endeavored to gather together the more important facts thus far observed and to discuss the bearing of them on the biological questions involved, more particularly with reference to evolution. The result is this little book,* written in a popular, but not too popular, style, and suited to the requirements of the general reader.

The first section of the book deals with the facts of variation and the methods adopted for their examination and comparison. It is interesting to see what complex schemes have been devised for the presentation of these facts, which have been gathered in large and still increasing quantities. The graphic method has been applied to this study, as numerous diagrams testify. The outcome of this branch of the inquiry is not everywhere as great as one could wish, but the number of students thus employed is very large, and it will be observed on examining the references that the share of American investigators in this work is large and creditable. To many this kind of research seems exceedingly tiresome and the results slow in coming and somewhat uncertain withal. There can be no question, however, that such methods must in the long run prove exceedingly valuable and that this form of learning will in the end enable us to hold at least one "eel of science by the tail."

In the second section an examination is made of the causes of variation. Here a vast fund of detail is presented and the reader learns how complex are the influences which bear upon variability or may be justly assumed so to do. In the

* VARIATION IN ANIMALS AND PLANTS. By H. M. Vernon, M.A., M.D., Fellow of Magdalen College, Oxford. New York: Henry Holt & Co. \$1.25.

third section, much briefer than the other two, variation is discussed in its relation to evolution. These portions of the book will prove entertaining as well as instructive even to those who are not particularly familiar with zoological and botanical matters. All through the book rather more attention is paid to animals than to plants, a treatment of the question quite justified by the material on hand and also by the distinctly more interesting nature of zoological variation.

The facts set forth by our author cover a wide range of inquiry, from the influence of the mere volume of water upon the growth of snails to the exactness of resemblance in twins and the likeness of offspring to the parents. Nearly every page suggests a question well worthy of patient investigation. If it be felt that the results are somewhat indefinite, the reader will feel satisfaction in getting a clear idea of the nature of the problem, and that is always a great gain.

Distinctly speculative, but attractive as well as novel, is the effort of Dr. Vernon (p. 358) to find in the recent researches on "internal secretion" an explanation of no inconsiderable part of variation. The last dozen years or so have shown that many glandular structures of the body act not by pouring out some special secretion upon a free surface, but by forming some peculiar substance or substances which enter the circulation and in some fashion, usually far from being clear as yet, contribute to the well being of the organism. While this idea is not new, having been suggested under the name of "interstitial secretion" nearly a century ago, the experimental evidence for it is of quite recent date. Vernon suggests that the agency by which the environment is enabled to act upon the germ-plasm and thus bring about changes in the organisms of the next generation is to be found in "a chemical influence, through products of metabolism and specific internal secretion." This is a proposition which invites study and may prove fruitful in results. At present we can only say that the facts thus far known make such an explanation plausible, but are not sufficient in quantity or quality to enable us to use them as

a firm foundation. There must be much experimental disturbance of metabolic processes and of glandular structures known to act by internal secretion before this explanation becomes even a good working hypothesis.

The Papal Monarchy

AFTER the last sieges by Totila (546-549) Rome was abandoned by its inhabitants, and for forty days lay desolate. With the ruin of the Western Empire complete and with the Lombards ravaging St. Peter's Patrimony, St. Gregory the Great ascended the papal throne and became the herald of the overlordship of the Popes, which was destined to continue until Philip of France, seven centuries later, rudely dragged Boniface VIII from his chair and left him to die in prison. Of this age, when "Priesthood ruled over Europe with crozier and scepter, sword and pen, with Bible, canon law and prophetic oracles sanctioned by penalties from which neither individual nor nation could escape," the present volume* narrates the history. Tracing the rise and decadence of the temporal sway "until royal authority took away its rod of dominion, the King became Pope and the Pontifex Maximus retired into the holy place before him."

But not with its task unfulfilled:

"The Barbarians, free men but destitute of culture, had been brought under the creative influence of a humane religion; they had been taught the elements of Greek and Latin civilization, and equality before the law, which was a principle at once Christian and Roman, had begun to be established as the foundation of modern liberty. . . . All over Europe learning was held in honor; the universities were centers of intellectual freedom. Slaves had become serfs. Serfs had been largely emancipated. War itself put on the graces of chivalry. There was a Christendom, the ideals of which were, at least, peace, brotherhood, holiness. From Councils, provincial or Ecumenical, emerged a sense of the nation's unity, and in due time a Law of Nations. Every church gave shelter to innocence, if sometimes also to guilt. Hospitals, almshouses, cloisters opened their gates to the sick, the aged and the outcast. Talent with-

* THE PAPAL MONARCHY, FROM ST. GREGORY THE GREAT TO BONIFACE VIII (590-1303). By William Barry, D.D. New York: G. P. Putnam's Sons. With maps and illustrations. \$1.35 net.

out regard to birth might aspire, and not seldom attain, to the highest seats in a spiritual order which held the temporal in check and made for independence." . . .

Finally declares the author:

"It is difficult to imagine how Europe could have survived from the fall of the Empire to modern times, had there been no central supreme and acknowledged power like the Papacy, guardian at once of faith, learning, law and civilization."

There is food for controversy in this and for somewhat acute disputation, too, when one meets such concrete statements as that Dante, Shakespeare and Goethe would all have preferred Innocent III to Calvin, St. Bernard of Clairvaux to Jean Jacques, and St. Francis of Assisi to Voltaire.

On the other hand, it may be doubted whether any writer within the pale of the Roman Catholic communion could have dealt with the subject more fairly and frankly than Dr. Barry has here done. If he defends Pope Innocent in his crusade against the Albigenses, because "in the year 1208 heretics appeared much as anarchists appear to us now—insane revolutionaries that cannot be reasoned with, but must be cut off by the strong arm of the law," and if he allows the "grand refusal" of Celestine to pass without censure, he scores Boniface VIII as the "most miserable of Popes," concedes that Sergius III was "malignant, ferocious and unclean," and characterizes Formosus and his successors for many a day as "spectres, often dabbled in blood, passing over the stage in a lugubrious masque of anarchy."

So well is the book written that one closes it with genuine regret that a larger canvas has not been chosen, coupled with the hope that it is merely the preliminary sketch of a larger and fuller history. Dr. Barry's style is vivid, often dramatic, and never gets dry except when the obvious exigencies of space compel him to compress into the briefest of paragraphs the treatment of subjects which deserve chapters. At the present day, when the Concordat between the "eldest son of the Church" and the Pope stands in peril of dissolution, the work is singularly timely and informing.

Recollections: Personal and Literary. By Richard Henry Stoddard. Edited by Ripley Hitchcock, with an Introduction by Edmund Clarence Stedman. New York: A. S. Barnes & Co., \$1.50.

To read these rambling and entertaining reminiscences is like sitting with an aged man before a pleasant fire of a long winter's evening and hearing him tell of

"Old *familiar* far-off things
And battles long ago."

Indeed, we fancy that some such process would not ill describe the actual composition of much of the book. It gives a vivid picture of the difficulties that confronted the young literary aspirant in the early years of the last century—difficulties which Stoddard faced manfully and won through with stout heart. He was apprenticed to many trades before it became possible to serve the muse with all his time and energy—was legal copyist, match-seller on the streets of New York, bookkeeper in a bankrupt brush and bellows factory, blacksmith, iron-molder, carriage-painter and clerk in the customs, by turns; but always literature was his ambition, and one by one he grew to know the men and women who then ruled on the slopes of the American Parnassus. Not the least interesting pages of his memoirs are those that tell of his meeting with Willis, Bayard Taylor and Park Benjamin, and Lowell and the lesser lights of New York and Boston. These relations were mostly amical, but they are not without acrid memories with which one does not know whether to be most amused or grieved. Stoddard has his reasons for disliking Poe, but one is inclined to think the naïve recrudescence to-day of this old battle might better have been suppressed.

"Do I blame Poe?" he says. "The gods forbid! With a race of hardy New England sailors behind me, and behind him a stock of hard-drinking Marylanders, his father an inefficient player, and his mother a fairly good English actress and vocalist,—who am I, pray, that I should censure anybody?"

That is, we submit, not quite nice; nor does this criticism of an exquisite poem seem quite free from personal spite:

"The parent of 'Annabel Lee' was Mother Goose, who in this instance did *not* drop a golden egg."

However, such passages are entertaining after all, and they call up vividly the spirit of the times when Stoddard was in the thick of the fight.

Contemporary Men of Letters Series. Edited by William Aspenwall Bradley. New York: McClure, Phillips & Co., 75 cents net a volume.

Walter Pater. By Ferris Greenslet.

Bret Harte. By Henry W. Boynton.

As Mr. Bradley says in his general statement, this series is designed to satisfy a legitimate curiosity in regard to living authors and those who, tho dead, may still be properly studied as belonging to our time. The volumes are made up with all the taste which distinguishes the books that come from these publishers, and promise well. Mr. Greenslet's monograph on Pater is a thoroughly sympathetic and penetrating study of that essayist, is indeed written in a style which often conveys something of the impression of Pater's own language. It does not seem to us that Mr. Greenslet quite sufficiently emphasizes the decadent side of Pater's genius and character, but there is large room for difference of opinion here.—Mr. Boynton gives more attention to the actual events of his subject's career, and criticises Bret Harte with a touch of causticity.

Crabbe. By Alfred Ainger. New York: The Macmillan Co., 75 cents net.

This new volume of the English Men of Letters is quite up to the level set by Sir Leslie Stephen in his *Life of George Eliot* and by Mr. Augustine Birrell in his *Hazlitt*, and it has the greater advantage of bringing before the public one of the classic poets of English Letters who is read far less than the intrinsic value of his poems would warrant. Indeed, it may well be said that a return, in some respects, to the methods of Crabbe would do much to save our modern magazine poets from the cheap vaporizing about nature and the flaccid treatment of humanity which render their verses so thin and false. The life of Crabbe had already been set forth at length by his son, so

that the task of the present biographer was a comparatively easy one. He has, however, taken advantage of some new material to explain more clearly how the poet contrived to exist during his early London days. The critical passages are sound and penetrating, altho, in our judgment, not ranking Crabbe's work quite so high as it deserves. We observe one curious omission. No mention is made of what is perhaps the most powerful of all Crabbe's poems, his "Peter Grimes." No extract can give any adequate conception of that tale of tragic

WALTER PATER

horror, yet we are tempted to quote the following lines if only to show his skill in uniting human emotion with natural description:

"When tides were neap, and, in the sultry day,
Through the tall bounding mud-banks made
their way,
Which on each side rose swelling, and below
The dark warm flood ran silently and slow;
There anchoring, Peter chose from man to hide,

There hang his head, and view the lazy tide
 In its hot slimy channel slowly glide;
 Where the small eels that left the deeper way
 For the warm shore, within the shallows play;
 Where gaping mussels, left upon the mud,
 Slope their slow passage to the fallen
 flood; . . .
 Where the small stream, confined in narrow
 bound,
 Ran with a dull, unvaried, sadd'ning sound;
 Where all, presented to the eye or ear,
 Oppress'd the soul with misery, grief, and fear."

Bryan's Dictionary of Painters and Engravers. New Edition. Revised and enlarged under the supervision of George C. Williamson. Vols. I and II (A to C and D to G). New York: The Macmillan Co., \$6.00 net a volume.

Bryan's Dictionary of Painters has been a standard authority since it was first published in 1816. Since then it has been frequently revised and enlarged to accommodate the ever growing list of artists. But during the last decade there has been such a radical change in the methods of art criticism that it has been found necessary practically to rewrite the lives of many artists, besides adding seventy-two new biographies to the new edition. Whole essays have been written on the more important painters and engravers by the leading critics of the day, who have shown much knowledge of their subjects, with great discrimination in writing for the public as well as for specialists, making this dictionary indispensable to every one interested in art matters. The study of the methods of the great artists is much aided by a large number of illustrations of their work in full-page half-tones and photo-gravures. It is necessary to add, however, that the biographies are marred by occasional grave mistakes of a kind that would seem inexcusable in so elaborate and learned a work. Take, for example, these two errors which appear on the first few pages of the first volume. That Beatrice D'Este should be called the Duchess of Mantua, in place of her sister, Isabella, is perhaps not a very important slip. But the following error is incomprehensible, where it is said of Angiolo Allori, who was born in 1502, that he "painted the most celebrated personages of his time, among whom were Dante, Boccaccio and Petrarch."

The Jewish Cyclopaedia: A descriptive record of the history, religion, literature and customs of the Jewish people from the earliest times to the present day. Complete in twelve volumes, with more than 2,000 illustrations. Vol. V. New York: Funk & Wagnalls Co., \$6.00.

This great and notable work progresses now rapidly toward its completion, which is promised by the end of 1905. The editing is excellent, and the most competent scholars in Europe and America, Christian as well as Jewish, are numbered among the contributors. While the number of distinguished Jews included in the work makes this very much of a biographical dictionary, the articles of more general interest are very instructive. In this volume such articles as "Egypt," "Education," "Festivals," "Fasts," "Esther," "Ecclesiastes," are full of curious interest, and the illustrations are not such as are found in other encyclopedias, often taken from old and rare sources. We repeat our commendation of the work, which is essential to libraries and ought to be possessed by all who care to study the history, the religion and the antiquities of the Hebrew nation, the only one which has maintained an existence ranging from the beginnings of civilization down to our own day.

The Shadow of Victory. By Myrtle Reed. New York: G. P. Putnam's Sons, \$1.50.

This is a story of frontier life about a Western trading post when that section was still red with Indian warriors. It is one of those old-fashioned tales that charm the reader without being a work of literary art. The characters in it act as we imagined people acted long ago when our imaginations were young and undisciplined by facts or conditions.

The True Abraham Lincoln. By William Eleroy Curtis. Philadelphia: J. B. Lippincott Co., \$2.00 net.

Perhaps not one of the several biographies of Abraham Lincoln is so well adapted for popular reading as this one, which is truthful and is all the more laudatory because of its truth. With great care and excellent judgment the author has collated and selected from an immense mass of material the substance of his book, and the result is a work where every paragraph is possessed of a vivid interest. No man who has ever walked

in high places has ever had a more difficult task to fulfill than Lincoln, and how well that great task was done none but close students of the period and of the man and the men who made the time what it was can ever form more than a superficial notion. Mr. Curtis is such a student, and we have to give him our grateful thanks for his labors. The book is worthy of every one's reading, and should be placed in the hands of every youth in the United States. The story—it reads like a story—is told mostly in anecdotes and extracts from the many biographies of Lincoln, Seward, Chase, Grant, McClellan, and others; yet there is nothing we would omit, some that, in its present comparative position, seems absolutely new, and much revealing characteristics and powers of which not enough has been previously made; such as his military skill, unsuspected by himself or others, until drawn forth by the country's need, and his diplomatic ability, for which, during his life, he did not receive the credit which was justly his due. The "true Lincoln's" faults are not overlooked, while his grand qualities here stand forth all the brighter by the side of his few defects.

A Sequence in Hearts. By Mary Moss. Philadelphia: J. B. Lippincott Co., \$1.50.

"She was a handsome, boyish creature, well built, athletic and pleasantly approachable,"—when a woman of this kind gets into a society novel, the more effeminate ladies may as well take a back seat, for soon or late the "boyish creature" will put her hands on the top rail of the story and vault gallantly into the most desirable man's arms. This is precisely what happens in *A Sequence in Hearts*. Indeed, it is the only delightful thing that does happen. Such stories are usually cleverly written; the trouble is they are founded upon a super-refinement of sensibility. There is no real occasion for the suffering endured, and nothing in the situation that warrants a natural display of feeling. And this is why such books, however entertaining, make but a fleeting impression. They do not really take hold upon the sympathies or imagination.

Pebbles

A LOT of money that nobody ever had has been lost recently.—*The New York World*.

....Extract from a contemporary: "We must protest with all our power against the disgusting and degrading spectacle of a prize fight which took place on Saturday between Jeffries and Corbett. Full details will be found on page 6."—*Punch*.

....A missionary in China was endeavoring to convert one of the natives. "Suppose me Christian, me go to heaven?" remarked Ah Sin. "Yes," replied the missionary. "All right," retorted the heathen, "but what for you no let Chinamen into Australia when you let him into heaven?" "Ah," said the missionary, with fervor, "there's no labor party in heaven."—*The American Federationist*.

....At the next station a furious mob was assembled. The air was filled with missiles and hoarse shouts. "A lynching!" I exclaimed, in horror. "Either that," rejoined my companion, who, as I afterward learned, while not an American himself, had closely observed the customs of the country, "or else a newly married couple are about to depart on their bridal tour." Anyway, it was fascinating, in a manner.—*Life*.

...."What are you feeding to those hogs, my friend?" the professor asked. "Corn, professor," the grizzled old farmer, who knew the learned gentleman by sight, replied. "Are you feeding it wet or dry?" "Dry." "Don't you know if you feed it wet the hogs can digest it in one-half the time?" The farmer gave him a quizzical look. "Now, see here, professor," he said, "how much do you calculate a hog's time is worth?"—*Lippincott's Magazine*.

ANECDOTES OF FAMOUS MEN.

DAVID.

"Rash youth," murmured the multitude as the daring son of Jesse advanced toward the glowering Goliath, "you are going to your death." "At least, I shall have my fling first," laughed the lad, producing a suitable pebble from his scrip.

NAPOLEON.

"That battery commands the position. We will take it," tersely remarked the Man of Marengo. "As your Majesty pleases," replied Ney, "but it will cost France dear." "Have it charged," returned the Emperor, testily.

BRUTUS.

"Come, Noble Brutus, would'st drive with me this fair Ides of March?" anxiously asked Antony. "Willingly would I, had I not promised to sleigh with Casca," replied the brutal conspirator, as he fingered his dented Damascus.—*Yale Record*.

Editorials

Panama and the Canal

IN considering the important questions which have arisen in connection with the separation of the State of Panama from Colombia, we should carefully distinguish between fact and rumor, evidence and the assumptions that are due to bias. It was entirely natural that Panama should assert her independence. After the extraordinary and almost contemptuous rejection at Bogota of the canal treaty that had been signed at Washington by Colombia's representative there, and signed at the end of prolonged negotiations in which the requirements of Colombia were satisfied, there was a general expectation that the Isthmus State would secede. This rejection, followed as it was by suggestions of extortion to which neither our Government nor the French canal company would submit, seemed to compel and to justify the withdrawal of the State so directly interested, a State having scarcely anything in common with continental Colombia, and from which Colombia had for a long time drawn large revenues without making return in the form of public improvements. It was known that our Government resented the discourteous action of Colombia, but there is no evidence whatever that it connived at the revolt on the Isthmus or encouraged the revolutionists of Panama. Mr. Roosevelt and Mr. Hay are incapable of entering into such an intrigue.

Did our Government, after the proclamation of independence, assist the revolutionists, except so far as an enforcement of the treaty of 1846 incidentally aided them? Wherein did our action differ from that which we have taken there in past years for the protection of the freedom of transit? We had no war ships at any Isthmian port, except the "Nashville," which entered the harbor of Colon the night before the revolt. Her commander insisted that the Colombian soldiers, who arrived a few hours later, should not be transported on the railway. Our marines, whom the Colombians outnumbered ten to one, were

landed for the protection of the railway property and of American citizens. They were stationed among the cars and at the freight houses, and were soon withdrawn.

In the past, under the requirements of the treaty, and sometimes at the request of Colombia, we have taken similar action, when it aided the Bogota Government and was to the disadvantage of revolutionists. This time it happened to assist the revolutionists because they were in possession, being substantially all the inhabitants of the Isthmus. We would not permit any fighting, because it must have taken place at or near the terminals and tracks of the railway. The inviting points of attack are Colon, Panama and other places on the railway that connects these two cities. The Colombian soldiers were not driven out of the country by our forces; unsupported and outnumbered, they accepted the terms of the revolutionists, who paid their passage on the passenger steamship that bore them away.

It is reported that our forces are now instructed to prevent the landing of any other party of Colombian troops. We have no right under the treaty to do this when the landing point is not near the railway, nor any right to prevent Colombians from attacking revolutionists at a considerable distance from the railway, unless it can be shown that in either case the freedom of transit is restrained. But no Colombians have attempted to land, since Tovar's troops sailed away, and Colombia has no soldiers on the Isthmus.

Those who severely criticise our Government admit that the recognition of the *de facto* Government of the Isthmus, on the 6th, was justifiable. It was thus recognized for commercial purposes and because there was no other authority with which we could deal for the protection of free transit and American citizens. But while full political recognition of the republic (not yet organized) has not been announced at Washington, it was virtually granted in the message of the 6th to Bogota, in which the President

commended to "the Governments of Colombia and of Panama" a peaceful settlement of their differences, thus placing the Isthmian Junta upon a political equality with the Government of Colombia.

This is one indication of the haste that, if we accept semi-official statements of purpose and policy, characterize the treatment at Washington of this delicate and complicated situation. The President added that he was bound to prevent the disturbance of traffic across the Isthmus "by unnecessary and wasteful civil wars." He is authorized and required to maintain freedom of transit, but it is not for him to enforce there any decision of his own as to whether a civil war in progress in Colombia is unnecessary or not. If our Government undertakes to enforce such opinions as to civil wars in South America, it will have its hands full.

It does seem to be the intention of the Washington Government to proceed in this case, so far as the projected canal is concerned, without the deliberation which the subject requires. This opinion, however, is based in part upon published statements apparently made by authority, but not official. We are told that full political recognition will be given to the new Republic as soon as it shall have been organized. M. Bunau-Varilla has already been appointed the diplomatic representative of Panama in this country, with extraordinary powers, and it is reported, apparently with his consent, that he is at once to begin negotiations for a canal agreement. If our Government negotiates with him, it thereby recognizes Panama as an independent and established republic.

In view of our own protests addressed to Europe forty years ago, we should be cautious about the hasty political recognition of a seceding State. We should at least wait for and duly consider the diplomatic utterances of Colombia, for to that nation we are still bound by "the ties of friendship, long and happily existing," according to the President's message of the 6th inst. We are not bound by the treaty of 1846 to guarantee her sovereignty on the Isthmus against insurrection, but we are required by considerations of international comity to wait for an expression of her views, and by other considerations to defer complete

recognition of Panama until there shall have been a little time for ascertaining whether these 300,000 people can maintain an independent Government, can assume and carry the obligations of treaties that "run with the land," and can meet the other local obligations which we sought to impose upon a nation of 5,000,000 of people in the canal treaty recently rejected. Another indication of undue haste is shown in the apparently authoritative statement that the President sees no necessity for new legislation to provide for canal negotiations with Panama, and even for the construction of a canal on the Panama route, altho the Spooner act says a treaty with Colombia must precede the purchase of the French company's property. Congress will have something to say about that.

This extraordinary haste, shown in acts and in what seem to be trustworthy statements of purpose, has given color to the charge that our Government was not neutral but was in active and useful sympathy with the revolutionists before and after the 3d inst., altho we find no proof whatever that the action of our naval forces exceeded the requirements of the treaty of 1846, as these have been defined in recent years.

The Elections

LITTLE, if any, change in the attitude of the people toward national issues was disclosed by the State elections of last week. The continued decline of Mr. Bryan's influence was shown by the defeat of the Fusion party in Nebraska, and the complete rout of Mayor Tom L. Johnson's forces in Ohio. Mr. Bryan has regarded Mr. Johnson with especial favor as a candidate for the Presidential nomination. We do not mean to ascribe the overwhelming defeat of the Mayor of Cleveland to that. We should prefer to say that Mr. Bryan's assistance and commendation could not save him from political burial under an adverse majority of 120,000 votes. The truth appears to be that Mr. Johnson suffered from the hostility of the McLean Democrats, chiefly in the southern part of the State; that the farmers were repelled by his advocacy, at other times, of the single tax; and that some signs of a decline of prosperity con-

firmed in many minds the teachings of Senator Hanna, that the entire industrial and commercial fabric was already beginning to shiver and shake at the thought of possible Republican losses in Ohio. The great Republican majority marks a personal victory for the Senator, who has again been forced to repel the suggestion that he ought to stand for the Presidency.

A Democratic majority in Maryland does not make the race issue a paramount one for next year's national campaign, but it keeps Senator Gorman before the public as a Presidential candidate. The defeat of his party, which he labored diligently to prevent, would almost have taken him out of the field. Tammany's success in New York may give the State's vote in convention to Mr. Cleveland, because the new Tammany Boss, Mr. Murphy, thinks the Ex-President ought to be nominated. It may be observed, however, that the prominent Democratic journal now calling loudly for his nomination because he "would be more likely than any other Democrat to carry New York, New Jersey and Connecticut," was expressing its "deliberate conviction" a few days before the recent election "that the success of the Tammany ticket on Tuesday next would destroy any chance that the Democrats might otherwise have of electing a President in 1904."

In another part of this issue Mr. Gustavus Myers has set forth the causes of the recapture of the city of New York by Tammany. The overthrow of the almost ideally excellent Reform government over which Mayor Low has presided is greatly to be deplored. But we cannot agree with some persons who predict a relapse into the corruption, vulgarity and infamy of the Croker-Van Wyck administration which the people condemned at the polls two years ago. Reform has set a high standard since that election, and the city must profit by that record, even under Tammany rule. The Government cannot now fall back to the level of those dreadful days. Mr. McClellan suffers from no taint of personal corruption or dishonesty, and he is a man of good impulses. To what extent he will yield to bad influences we shall know in due time. He is young and ambitious, and he will make some resistance. Comptroller

Grout remains in office, and there are two years more of District Attorney Jerome's term. The prospect is not very encouraging, but it might be much worse. Those who voted for the beaten ticket should strive to insure victory two years hence by removing, if possible, some of the causes of this year's defeat, by perfecting their organization, and by subjecting the acts of the new Government to that careful scrutiny which has so effectively promoted the cause of municipal reform in the past.

The Passion for Uniformity

FEW Americans realize the extent to which centralizing tendencies in legislation and in administration have modified the earlier practice of local self-government in the United States. The overthrow of the dogma of States Rights by the Civil War was the least of the changes that have been manifested since 1860. In every commonwealth the functions that once belonged wholly to townships or to counties have to a great extent been taken over by the State government. State boards or State superintendents of education watch over the local organization of the schools, State commissioners of charities hold the local overseers of the poor up to uniform standards, State boards of health prescribe rules and procedure to local boards, and in certain States, notably in Massachusetts, which in many ways is the most democratic commonwealth in the Union, the police system itself has become in part a State institution.

Most of these changes have been beneficial. A higher standard of service and a broader conception of administrative duty have resulted from the compulsion placed upon local organs of self-government to conform to standards of grasp and efficiency imposed by the will of a relatively large body of people. It is, however, a question worth raising whether we may not lose more than we gain if we carry centralization much beyond its present limits, indulging a passion for mere uniformity of statute and of governmental methods, without considering whether diversity in many matters is not more to be desired.

No one will deny that in picturesque-

ness and in general interest a country, a State or a local community gains much by differing in manners, in customs and in institutions from its neighbors. The infinite charm of Europe for the American is largely consequent upon the division of its territory among independent nations, each of which has in a good degree preserved its own traditions and has cherished its own peculiar aims. Life would lose something inestimably beautiful and morally valuable if the processes of assimilation should go so far as to bring all the European peoples to a dead level of uniformity in their social habits and political activities. The forces making for uniformity in this modern age are almost irresistibly strong. World intercourse has banished the picturesque costumes of only half a century ago. Even Japan is adopting the convenient but certainly not artistic Western garb. Machine industry has destroyed handicrafts, and with them a large measure of artistic feeling. Convenience, comfort, luxury even, have become our objects, and in a sense our standards. And we do not often enough ask ourselves whether they are always worth the price that we pay for them.

This price is more than a surrender of the beautiful and the picturesque. These are its conspicuous elements, and our attention is so fixed upon them that we come to think of them as the only ones. And being a practical people, living in a practical age, we say that it is a pity to give them up in exchange for the useful, but that, after all, the useful is more necessary. The truth, however, is that the real price that we pay for too much uniformity is the loss of individuality, and individuality is the perfect flower and fruit of the rational and the moral life. It is in individuality that a man or a nation realizes the possibilities of idealism, and fulfills the law of progress and of life.

Now individuality is largely a product of the daily action and reaction between man and the objective conditions of his existence. His institutions and his laws imperceptibly mold his nature, determine his aims, and stimulate or discourage his struggle to rise above the plane of a merely animal existence. Whenever, then, we deliberately destroy any diversity of

manners, of customs or of laws, just because it will be more convenient to live under a *régime* of uniformity, we are destroying in some group of human beings their spontaneity, their natural and unconscious way of doing things, and drying up the springs of individuality. We are substituting a forced or mechanical conduct for that which is a sincere expression of personal ideals.

Doubtless there are many matters in respect of which here in the United States further progress toward uniformity is still on the whole to be desired; and many others in which we would not return to a former variety. Certainly we should not wish for the sake of diversity to allow each commonwealth to set up tariff barriers against the free commerce that now prevails throughout the Union. Assuredly we should not wish to go back to such diversity as that which tolerated human slavery in the plantation States, nor to that which permitted the Mormon Church to build its social fabric upon the barbarian foundations of polygamy. Nevertheless, whenever the question of any further attempt to bring about uniform legislation or uniform administration is raised, we should look carefully into all the conditions, and inquire whether the end to be achieved by uniformity is after all so vital that we can afford to sacrifice the moral freedom, the spontaneity of conduct, the differentiation of ideals, which have within them all the potentialities of beauty and of individuality in our social life.

Church Union and Church Federation

THE leading organ of the Methodist Episcopal Church in this country, edited by Dr. Buckley, welcomes the proposition of the sixty Episcopal bishops who met lately in Washington, for conferences with the Presbyterians and Methodists looking toward some form of reunion. At the same time it sees that this is impossible without a radical change on the part of these bishops from what has been and is still supposed to be their attitude and claims. It recalls that when our Episcopal brethren were in conference on this subject with the Presbyterians THE IN-

DEPENDENT consulted the Episcopal bishops of the country, and learned from them, by their individual replies, that they could not admit the regularity of a ministry not episcopally ordained—that is, that union meant reordination and submission to the Episcopal view. To talk of union on that basis is pure moonshine. To ask union by submission is an insult. There can never be union, and never ought to be, except on the basis of inclusion of those who hold varying views. Accordingly, *The Christian Advocate* says:

“None of the Evangelical denominations, so-called, that recognize each other's ministry and sacraments, can possibly take a step which would take away the power of that recognition from them.”

But where union is impossible, may not federation be feasible? This *The Christian Advocate* suggests:

“It would be a most glorious spectacle for Protestantism, leaving out, of course, those who deny the deity of Jesus Christ (for all who deny that practically declare all who admit it to be idolaters), to raise the banner of genuine Christian unity, presenting thus to the pagan world, to the Roman Catholic, the Greek, the Russo-Greek Churches, and to Mohammedanism, a body thoroughly unified, representing Christianity free from what they believe to be yokes that had their origin in many elements which do not spring from the seeds planted by Jesus Christ, but from the love of power, organic and individual. It might then claim to be The Catholic Church.”

This can be accomplished only by federation, and such federation is one of the crying needs of our Protestant Churches. Some of our denominations in their national meetings have pronounced in favor of it. It would maintain the separate entity of denominations that are not ready to consolidate, and yet would be an evidence to the world of their essential and spiritual unity. We understand that it ought to be the business of such an organization as the National Federation of Churches to seek such a federation of denominations. It might be invidious for any one denomination to take the lead in inviting a conference for federation, for we have in this country no one confessedly pre-eminent denomination, as they have in England. But this Federation of Churches, which has hitherto labored to secure fellowship in labor in cities and

towns, might well send a proposal to the national body of every Protestant denomination in the country asking it to appoint representatives to meet in Washington in 1906—which will give time—with a view to the establishment of a federate union of the entire body of Churches. If this existing Federation of Churches does not thus present the matter generally, why should not the various National Conferences, Conventions, Assemblies, Synods and Councils independently make the proposition and appoint committees? We commend this proposition to those of every denomination who are interested in the visible unity of the Christian Church.

The Macedonian Appeal

WE do not wonder that a resident in Turkey, who does not believe in wholesale assassination, such as has been carried on by the Turkish soldiers in Macedonia, and who is near enough to know and feel its horrors, should be so stirred up by it that he would appeal to this country and to the civilized world to put an end to these shocking atrocities. In an article in this week's INDEPENDENT he persuades himself, and would persuade our Government, that we can do this. He says that Russia and Austria and Germany do not wish to interfere; that France is withheld by her obligations to Russia, and that only Great Britain, of all the European nations, has the heart to intervene, but that she is prevented by the knowledge that Russia and Germany, perhaps, would seize the opportunity to break up the British Empire. What he desires, then, is that the United States should guarantee Great Britain against attack while engaged in her merciful work.

That some Power should intervene is most desirable. We have hoped that Russia and Austria would do so, as they have threatened. Nor is it yet clear that they will not, if the insurrection breaks out again in the spring. That England can do it alone, and against the will of Russia and Austria, is incredible. She cannot now repeat what she could do in Cromwell's day. To be sure the duty seems clear if anyhow possible. What

the United States did for her neighbor, Cuba, to put a stop to a period of chronic war, ought to be done by some neighboring Power in Macedonia, and the duty comes first on Russia and Austria as next at hand. If they will not, then France or Germany, aided by Italy, should do it. If they will not, then the duty would come to England; but it is futile for England to attempt it against the will of the neighboring Powers.

But our correspondent says that England could and would do it if the United States should tell Russia and Germany to keep their hands off. We would it were so, but we fear it is not. In the first place, England would require a binding treaty of alliance for the purpose. On the side of Great Britain a Government can make a treaty, even a secret one; but on our side a treaty has to be ratified by the Senate, and we have no faith that our Senate would ratify such a treaty with Great Britain as that country has made with Japan. We are tied by our Constitution. It is by no means clear that our Constitution does not unfortunately tie our hands. We have had very uncomfortable evidence to this effect, notably in the rejection of a treaty of arbitration, where a minority of the Senate prevented the ratification. The same trouble would, we presume, prevent the ratification of a treaty of alliance with Great Britain for the liberation of Macedonia from misrule.

Further, were such a treaty effected, it is by no means clear, as our correspondent believes, that our alliance would prevent the armed opposition of Russia and Germany. We could do little except with our Navy, nor could England. We fear that the alliance of England and the United States would be resented and resisted by Powers whose land forces are overwhelming. We could not safely go into such an alliance presuming that we should not be called on to back it up with war—a war that might involve the whole of Christendom, and that thought should give us pause.

We fear the time has not come when we can play the part of a stronger and elder brother to the whole world, protecting the oppressed everywhere. We do not find it easy to do it even in our own country. We should be champion where

we can, but we cannot everywhere; and we do not see how we can now in Macedonia. This much we can do, express our horror and send aid to those who suffer, to save them from starvation. When Greece was struggling for independence Lord Byron gave his life to their cause, and Julia Ward Howe's husband risked his own. This they could do; we can at least give bread and clothing.

The Farm Home

THE farm home of the present day is associated with privileges that even the city could not indulge fifty years ago. White sugar was a rarity, if not a vanity, while few of the store conveniences which now constitute necessities of life found a place in the country house. The conditions of life were such that pneumonia, typhoid fever and a whole gamut of similar ills were looked upon as inevitable accessories, if not orderings of Providence. The farmer expected to provide his own meat, fruits and vegetables, while the housewife made her own soap and candles, and did her own dyeing, spinning and weaving. A strike in the coal fields would not have affected a farmer's home seventy-five years ago, had coal been known as a fuel. Stoves even were unknown as cooking apparatus, and were barely introduced as heaters. Barns were so constructed that swallows found little difficulty in entering through the cracks to swing their nests from the rafters.

As late as 1840 not one farmer in one thousand had seen a steam car, and plank roads were not so common as corduroys. Machinery was just lifting the farmer from his knees, where he worked with a hook to reap his grain, to ride upon his harvesters and do in a single day the work of twenty men. The farmer of half a century ago was old at forty and worn out at fifty. To-day he is erect and stalwart at eighty. The steam age, in spite of the relative depression of agriculture, leaves us with a kindly impression of what it accomplished for the tiller of the soil. It enormously reduced the amount of manual labor necessary for field work.

American country homes are in espe-

cial contrast with those at the beginning of the nineteenth century in their surroundings. The evolution of new and nobler fruits and vegetables was one of the amazing achievements, accomplished mainly since about 1840. The strawberry was doubled in size, over and over again, until now it is at least eight times the size of the wild berry. Nineteen hundred and three reports six strawberries filling a quart basket. This is more than one hundred times the size of the old field berry. Three thousand years of study and experiment had not accomplished as much in making the flora of the world of economic value to man as did the latter half of the nineteenth century. The work of Mr. Burbank alone outmeasures that of whole centuries preceding. Such men, like wizards, touch the weeds of the field and turn them into edible products. It is hard to tell just what will be the end of this magnificent triumph of experiment and investigation. Nature cared only for the propagation of species; man is working on the line of developing richer qualities of food and higher grades of beauty. It is the march of the brain through the centuries that all along the way achieves more delicious pears, like the Sheldon and the Anjou; nobler apples like the Northern Spy and Baldwin, and those combinations of beauty and utility which every year appear in our rose beds and our lily beds. The work of experimental stations has scarcely begun. We have every reason for supposing that the development of flowers and fruits will go on even more rapidly in the future. We shall have hardy oranges as far north as New York, and the peach belt will be widened well up into Canada. The triumph over aridity of soil, by a national system of irrigation, will be followed by an equally complete triumph over conditions of the air and climate.

The twentieth century begins its work with one achievement of agriculture even more important than those already recounted, the evolution of the market. It was hardly worth our while to have plowed the prairies and planted the great river valleys so long as we were compelled to burn our corn for fuel, and fatten swine with wheat. The question to-

day is, Will we be able to supply the markets that are opening before us? Our corn, our wheat and our apples cross the Atlantic to Europe, and the Pacific to China and Japan. The Pacific States cannot furnish one-twentieth part of the food products that are now demanded by the opened markets around that great sea of the west. China offers to take all the apples that can be grown from Vancouver to San Francisco, and when the Isthmian Canal is finally dug it will absorb a large share of the fruit as well as the wheat of the Mississippi Valley.

Changes in the way of rapid transit are startling only to those who can look back over half a century. The indications are that electricity will work even greater changes in the years ahead. At the present rate of progress the trolley car will have bound together nearly all our scattered villages and hamlets, and even reached the most remote farmer before 1925. It will become the great carrying vehicle—directly from field to market. Co-operation in the way of building, reaping, harvesting and domestic industries is taking a new and broader sweep. Co-operative marketing follows co-operative production. This will work a revolution in more directions than one. It will require a more accurate system of grading our products, and will develop a higher degree of economic education. Science is showing us the values of the most despised weeds and neglected products. The corn stalk and the cotton seed are as important as corn and cotton themselves. A noted chemist says: "I believe there is not a by-product or a residuum, or a weed in our fields, that will not be found to be of value to human beings." This is a wonderful world, when we find out its possible adjustments and get things fitted together. Even the Russian thistle, which so alarmed our Western farmers, is now sown on the ranches as a superior food for cattle and horses.

Looking ahead is always more rational than looking backward, and for a farmer it is just now more attractive. We are in a very good position for more commanding progress. We have the world's market; we have the transportation, and we are developing the wit to solve new problems. We shall introduce

on the farm more economic habits as well as more enterprise and skill; we shall concentrate sufficient labor of an educated sort to keep production equal to the enormously increasing demand. The one greatest lesson is to make our brands unimpeachable, and our word as good as our bond. The word *Yankee* must cease to mean sharpness, and stand for unblemished honor. Tact, honor and industry are the trinity of human thrift. American agriculture will not be able to dispense with any one of the three.

The Value of a Tag.

The commercial damage of a bad memory is illustrated in the reports of the lost property branch of the London police. During the last year there were received 47,434 articles found in public carriages, which, compared with the figures of the preceding year, shows an increase of 7,213. The total for the last five years is 206,417 articles. Analyzing and classifying the 47,434 lost articles of the past year it appears that they included 3,452 bags, 2,373 articles of men's clothing and 2,374 articles of women's clothing, 1,118 articles of jewelry, 231 watches, 3,486 purses, 845 opera and field glasses, 334 rugs, 977 sticks, 10,636 miscellaneous articles and 21,608 umbrellas. Thus it will be seen that the umbrella by a large plurality maintains its distinguished pre-eminence in the records of forgetfulness. Here is a fruitful subject for psychological investigation. What is there in the moral or physical nature of an umbrella which leads to such a vast number of them being annually numbered among the lost and abandoned? No deductions can be drawn as to the relative weakness of the masculine and feminine memory from the London statistics, for with remarkable impartiality it appears that the number of male and female garments lost was within one of being the same. No generous male statistician would take advantage of the fact that this excess of one was feminine. It would be interesting to know of the umbrellas lost how many were male and how many female, but the records do not preserve such distinctions. Nor can we tell the vast total of umbrellas which are annually

abandoned in London by inconsiderate owners, for it must be noted that those recorded are simply those that are left in public carriages. We know nothing of the number left in stores and hotels and restaurants. Among the miscellaneous articles left in railroad trains and in cabs were valuable dressing bags, bicycles, several live birds, fowls, dogs and a rabbit. Nearly one-half of the total number lost in public vehicles were restored to their owners. The amount of rewards paid to drivers and conductors was about \$16,000. The unclaimed articles were returned to the drivers and conductors who found them. The London system of turning over all articles found in public conveyances to a special bureau of the police, instead of to a lost property department connected with each company, doubtless results in a far greater number of restorations to owners. The London cab driver is so well trained that the cases are extremely rare in which the cab driver will risk losing his license by appropriating the property found in his cab. The total number of larcenies for 1902 in London was 7,544, or less than one-sixth the number of the articles lost in public vehicles; while the total number of felonies committed relating to property were 29,675, fewer than the losses through forgetfulness that are recorded, and doubtless a great many more are not recorded. Thus when we compare the action of the public conscience with that of the public memory, it is the latter which seems to lack development. Sad as are the regrets which are due to the abstraction of property by a thief, those which are due to the abstraction of the owner are much more numerous. It is worth noting that every one of these 47,434 articles could have been returned to the owner if the simple device of a tag with an address had been used.

Dr. Dowie Dr. Dowie has come and gone. He has advertised himself well, and has had tremendous audiences of those who wished to see and hear some new thing. Sometimes he spoke decently and often ably, too; sometimes he ranted and raved. His language was not always elegant, and he has the power of abuse. And he received abuse

and ridicule in return. We still believe that he is not a conscious fraud, but rather one of the multitude of men who have honestly persuaded themselves that they have a divine commission to readjust humanity. He is rough in his language, but so were Elijah I and Elijah II; and Elijah III has come far short of the spirit and power of the first Elijah, who, if he spared his tongue, which we doubt, hewed his enemies to pieces with the sword by the hundreds. Dr. Dowie seems to have made few converts, and he has not found faith enough here to cure many, if any, sick. We presume that he will return to Zion City with no sensible addition to its population or its wealth, and with some loss of prestige. But this was not the way to gain converts. He should have begun in a less spectacular manner, and expected a gradual growth in the way of nature. His is a sad delusion, but one that we doubt not has made better and purer men and women of a multitude of his adherents. But any earnest delusion does the same, even Babism.

That Return Ticket

It is reported that Pius X will not remain a prisoner in the Vatican, but will in a short time visit other parts of Rome and Italy. We knew he would. And we know why. It will be remembered that when Sarto left Venice for the conclave he bought a return ticket. Return tickets are not transferable in Italy and there are no scalpers. Now the time is nearly up for the expiration of that coupon, and no Italian of peasant training would be willing to waste it even tho he possessed the treasures of the Vatican. It was the thought of this return ticket which made Sarto so reluctant to assume the office to which he was elected. Cardinals Ferrara and Vannutelli beseeched him to accept the tiara, but he begged them with tears to select some other candidate, as there was an insurmountable obstacle to his becoming Pope. Finally a whisper from Mgr. Merry del Val showed him there was a way by which he could use that return ticket even tho Pope. It was for this diplomatic suggestion that Merry del Val was recently raised to the position of Secretary of State to the new Pope, as we knew at the time he would be. The truth of our theory is demonstrated by

the number of things it explains. Ordinarily, of course, such revelations as this, showing that all great historical events depend on petty personal motives, are not published until some fifty years after the parties concerned are dead, and when the standard histories are being written, but in this case we are so free from fear of contradiction from the Vatican, and direct evidence is so absolutely lacking, that we give it to the world now. The reason why editors devote so much space to divulging the secrets of kings and courts and explaining the private motives of statesmen is because it is so easy and so perfectly safe. If there is contradiction they can appeal to posterity, which is even slower in rendering its verdicts than the Supreme Court.

Polygamy in Utah

While we believe that polygamy is dying out in Utah, it certainly is not extinct. Doubtless it is still taught and practiced more or less, and it may be that polygamous marriages are still celebrated in the endowment houses. Many of these cases of polygamy—we trust most of them—remain over from the period before President Woodruff's famous Manifesto forbidding or discontinuing it. This was hardly a "revelation" forbidding polygamy, but was the prophet's direction to cease contracting such marriages for political reasons. Apostle Reed Smoot, elected to the Senate, recently admitted that he knew of at least 750 cases of polygamy. It was on the strength of their solemn promise to give up polygamy that Utah was admitted as a State of the Union. We believed them; we still believe that polygamy is doomed, but there is too much of the practice still maintained. The Apostle Joseph F. Smith is now living with five wives, two of whom were probably taken since the Manifesto was published. Apostle Smoot says he has but one wife, and we suppose it is true; but if he knows of 750 cases of polygamy still practiced, he is guilty in not trying to have the practice abolished. We can give the names and facts as to scores of such unlawful marriages—many of them cases in which it is physically impossible that the marriage should not have taken place since the issuance of the Manifesto

and the promise to obey the United States law. We do not refer to these cases to show that Apostle Smoot should not be admitted to the Senate, but to express the dissatisfaction of the American people with the way in which the laws are violated. The argument against the admission of Apostle Smoot is simply this, that he is in part responsible for the government of the Mormon Church and the State of Utah, which allows this condition to continue.

For the success in getting at last a concession for an American expedition for excavation in Babylonia both Minister Leishman and Dr. Banks deserve great praise. When, after years of waiting and the death of the chief generous promoter, President Morton, the American Committee was disbanded, Dr. Banks, supported by Mr. Leishman, stuck to the plan, and Mr. Leishman offered himself to provide the necessary means to carry on the expedition for two years. Then came the Beirût incident and the American fleet anchored in Beirût; and the Sultan sent to have the application returned to him which had been definitely refused a few weeks before, and it was speedily granted. And just then came President Harper with sufficient funds to adopt Dr. Banks and his expedition and make it an assured success; but we must not forget the credit due to the patient faith of Dr. Banks and Minister Leishman.

We mentioned last week the courageous articles in *The South Atlantic Quarterly* on Southern race and literary questions. The writers are Southern Methodists connected with Trinity College, a Southern Methodist institution in North Carolina. But now appears the organ of that Church in North Carolina rebuking Professor Bassett and the others for their utterances, not because they are wrong, but because, to speak plainly, discussion should be suppressed, right or wrong. It says:

"Those who attempt to teach the people now on this subject are playing with fire. . . . No matter how honest Professor Bassett may be, nor how just his views, in the main, it is untimely. There was a time when the expression of anti-slavery views would not be tolerated, and a man had to choose between keeping such views to himself or leaving the country."

Such a comment is cowardly and disloyal to truth and to God. But we fear Professor Bassett will have to "leave the country."

We received not long ago from a clerical subscriber a copy of a circular, sent him by one William H. Farr, who posed as the head of the "Nashville College of Law," composed in most extraordinary "hifalutin," and offering to present the recipient, on account of his distinguished scholarship, the degree of doctor of laws. It was evident that there was a fraud contemplated, as there is no such institution competent to offer degrees. It is a pleasure to know that the man is now under arrest, for fraudulent use of the mails. Our advice is, to take no degrees without residence and study in an institution of established character. From correspondence schools get all the instruction you will, but take no degrees—nothing beyond diplomas of work done.

We are glad to be able to present this week a character sketch of Mme. Curie, the discover of radium and polonium. Her success is a new and striking proof that women can succeed in the most difficult physical studies. The inferior education of women has hitherto prevented their taking their fair part in mental achievement, and men said that women were essentially inferior. Now the multitude of women seeking the highest education is bearing fruit in scientific and historical papers of great value presented to every learned society. Mme. Curie's discoveries have almost revolutionized our notions of chemistry.

Plans are now being perfected to send relief to the suffering refugees in Macedonia, a hundred thousand of whom are in danger from starvation and cold during this coming winter. Subscriptions are invited, to be sent to Kidder, Peabody & Co., Bankers, Boston. A trustworthy article in this week's issue makes the need plain, and must appeal to those who love their neighbor in distress. We did well for the Armenian sufferers; we should do the same for those of Macedonia.

Insurance

Per Capita Fire Loss in Large Cities

AN interesting report on the fire loss per capita in the larger cities during 1902 has been issued by the National Board of Fire Underwriters. The details of the report have been obtained through the chiefs of the various fire departments in the cities named and the data is consequently quite conservative, as these officials would, of course, wish to make as good a showing as possible. Arranged in a graduated scale, the list is as below:

Washington, D. C.....	\$0.49
Topeka, Kan.....	.71
Salt Lake City, Utah.....	1.11
Baltimore, Md.....	1.34
Peoria, Ill.....	1.51
Omaha, Neb.....	1.51
Detroit, Mich.....	1.56
Cleveland, Ohio.....	1.57
Newark, N. J.....	1.64
Des Moines, Iowa.....	1.66
Milwaukee, Wis.....	1.66
Philadelphia, Pa.....	1.66
St. Paul, Minn.....	1.74
Indianapolis, Ind.....	1.75
Brooklyn and Queens.....	1.88
San Francisco, Cal.....	2.01
New York City, N. Y.....	2.04
New Orleans, La.....	2.08
Manhattan and Bronx.....	2.09
Chicago, Ill.....	2.19
Portland, Maine.....	2.66
Louisville, Ky.....	2.71
Minneapolis, Minn.....	2.74
St. Louis, Mo.....	2.87
Boston, Mass.....	2.88
Seattle, Wash.....	3.00
Cincinnati, Ohio.....	3.09
Kansas City.....	3.20
Hartford, Conn.....	3.92
Memphis, Tenn.....	4.33
Atlanta, Ga.....	4.74
Birmingham, Ala.....	8.58

The ratio of loss from electrical fires to the total was 4.31 per cent., as compared with 3.4 per cent. the previous year.

ROBERT J. HILLAS, for twenty-seven years in the service of the Fidelity and Casualty, has been advanced from the Secretary-Treasurership to the Vice-Presidency.

....Embezzlements and defalcations for the month of September, as tabulated in the current issue of the monthly

Bulletin of the Fidelity and Casualty Company, show a most alarming increase over the large total of the preceding month. In the department of Court Trusts, in which no defalcations appear during August, there is in September a total loss of \$560,000, because of various breaches of trust. Firms and corporations suffered losses, because of financial infidelity, \$208,971 greater in September than was the case the month before. The September items are given in the following table:

Banks.....	\$52,398
Benevolent institutions and societies...	12,280
Building and loan associations.....	1,500
Court trusts.....	560,000
Federal and State.....	8,716
Firms and corporations.....	487,650
Insurance companies.....	6,404
Municipal.....	5,307
Transportation companies.....	5,955
Miscellaneous.....	104,027
Total.....	\$1,244,237

....In a very attractive volume recently published under the title of "The First Business of the World," Vice-President D. P. Kingsley, of the New York Life, has assembled certain of his addresses and other papers. The material entering into the book is in the nature of messages to the men who were identified with the New York Life Insurance Company during the period between the years 1892 and 1903. Several of the papers have appeared at various times in THE INDEPENDENT. Some of Mr. Kingsley's sentences are epigrammatic and the whole book is charged with enthusiasm. The business of life insurance is presented by Mr. Kingsley from various points of view and some of its less known applications are explained in a luminous manner. Several included sermons from the *Bulletin* are particularly bright and readable. As an example of book making, "The First Business in the World" is very creditable. The typographical effects are good, rubrication being judiciously introduced throughout. The Life Insurance Creed bound in as a frontispiece is a well executed example of modern illumination. The volume is bound in half morocco by Stikeman & Co., and reflects credit upon that firm. In many respects the book is more satisfactory than any previous volume in its class we remember to have seen.

The Independent

VOL. LV NEW YORK, THURSDAY, NOVEMBER 19, 1903 No 2868

Survey of the World

The New Republic of Panama

M. Bunau-Varilla was formally received by President Roosevelt on the 13th and recognized as the Envoy Extraordinary and Minister Plenipotentiary of the new Republic of Panama. Three days earlier the Junta had appointed a Commission (Dr. Manuel Amador, Federico Boyd and Carlos Arosemena) to visit Washington and advise with him concerning a canal treaty. They will arrive at New York this week. At last accounts the Isthmus was peaceful, and the new Government was working smoothly. Seventy-five "dissentients" have been expelled from the country and shipped to Cartagena at the republic's expense. It was announced on the 9th that our Government had decided to forbid and prevent the embarking of Colombian troops at Buena Ventura or any other port for the Isthmus, and that our war ships would enforce this decision, which indicated a policy believed to be "in the interest of the general good." On the following day this decision was modified, because it authorized an act of war. The "Boston" was directed to go to the vicinity of Buena Ventura and to give warning to any troops that might embark there that they would not be permitted to land on the Isthmus.—The protest submitted to our Government in behalf of Colombia was made by Minister Herran, on his own responsibility. He had had no communication with the Bogota Government. On the 10th President Marroquin cabled to the Junta that action upon the treaty would be taken in August next, and that General Reyes was on his way to Panama as a Commissioner, who would seek to preserve

peace and the national honor. At the suggestion of M. Bunau-Varilla, the Junta replied that he would not be received or permitted to land unless he should be duly accredited to the Republic as an Ambassador. As his mission would be in accord with Mr. Roosevelt's advice to Colombia, our Government has decided to extend to him the courtesies of a war ship upon his arrival. Late reports indicate, however, that he has started from Bogota with an army to subdue the revolutionists. In response to a message of sympathy from President Plaza, of Ecuador, President Marroquin telegraphed that Generals Reyes, Caballeros, Ospina and Holguin were marching to the Isthmus with a large army. Similar dispatches were sent to the Colombian Minister in Peru. It is said to be impossible for an army to reach the Isthmus by land, owing to the mountains, the hostile Indians, and the impenetrable tropical forest. General Holguin, at Bogota, asserted last week that Colombia would never recognize Panama, but would exhaust all her resources and every drop of blood in putting down the rebellion. There was a riot in Bogota on the 8th, when a mass meeting denounced Marroquin's Government and demanded that he be deposed. The city is under martial law. Four days later the house of the American Vice-Consul at Barranquilla was stoned by a mob. President Marroquin has appealed to all the South American countries, denouncing the revolution and asking them to co-operate with him in reclaiming the Isthmus. The report that President Castro would take advantage of the situation to obtain revenge for Colombia's sup-

port of Venezuelan revolutionists has not been confirmed. Our Government does not intend to send troops to the Isthmus. The crews and marines on board the vessels at or near Isthmian ports number nearly 5,000 men.—Delayed dispatches from Bogota, dated the 10th, say that Generals Reyes, Holguin and Ospina started on that day for Panama, not at the head of an army bent upon suppressing the Isthmian traitors and revolutionists—as President Marroquin said in his message to the President of Ecuador—but on a diplomatic mission, with full power to offer a satisfactory treaty and any other concessions that would induce Panama to enter the Colombian fold again.

Attitude of our Government

By the action of Mr. Hitt, in the House on the 9th, the purpose of the Democrats to question the Administration concerning Panama appears to have been forestalled. Mr. Hitt introduced a resolution requesting the President to send to Congress, if not incompatible with public interests, all correspondence and other official documents dealing with the Panama revolt. A similar resolution has been introduced in the Senate by Mr. Cullom. At the end of the week there had been no speeches in Congress on the subject, altho Mr. Livernash, of California, had tried in vain to make one. The attitude of the Democrats in the Senate has not been defined, but it is expected that they, or a majority of them, will oppose the ratification of a new treaty and will insist that the Spooner Act requires the President to take up the Nicaragua project. Mr. Hanna will be made chairman of the Canal Committee, displacing Mr. Morgan. It is understood to be the opinion of the President that no further legislation is needed to authorize him to negotiate a canal treaty with Panama. Work upon such a treaty will be begun this week. It is said that the canal strip will be ten miles wide, instead of six, and that Panama will give the United States a perpetual lease of it. Some say that the treaty of 1846 is sufficient warrant for the establishment of a protectorate over Panama. The negotiations will be facilitated by the presence on the Isthmus of Rear-Admiral John G.

Walker, chairman of the Canal Commission, who started for Colon a few days ago on the "Mayflower," with Rear-Admiral Coghlan.—There were given to the press, at the White House last week, passages of the forthcoming message of the President as they were written two or three weeks ago, before the revolt. In these passages the President spoke of the rejection of the treaty at Bogota, and said that our Government, "in accordance with our settled policy of behaving with scrupulous fairness and generosity toward our weaker sister Republics on the south," had sought to proceed by treaty, altho "it has sometimes been questioned whether a treaty was necessary, high authorities on international law holding that a canal can be dug as an incident to exercising the power to prevent the obstruction of traffic across the Isthmus." We were warranted in saying that the canal must not be dug by any foreign Government or any private company. It was time, he thought, to declare that the beginning of the canal must not be much longer delayed. This nation would not permit any body of men permanently to obstruct one of the great world highways of traffic, and the refusal to permit the building of the canal amounted to such obstruction. He continued:

"It seems evident that in a matter such as this we should finally decide which is the best route, and if the advantages of this route over any other possible route are sufficiently marked we should then give notice that we can no longer submit to trifling or insincere dealing on the part of those whom the accident of position has placed in temporary control of the ground through which the route must pass; that if they will come to an agreement with us in straightforward fashion we shall in return act not only with justice, but with generosity; and that if they fail to come to such agreement with us we must forthwith take the matter into our own hands."

This is what the message would have said if the revolt had not taken place.—Owing to the assertion of the Colombian Consul-General at New York that the Colombians were clamoring for a German protectorate and urging their Government to offer land in return for such protection, Chancellor Von Bülow and other authorities at Berlin have emphatically said that no such proposition would be entertained and that Germany follows with sympathy the efforts of the United

States to establish order on the Isthmus. She has already recognized the *de facto* Government of Panama.—President Marroquin on the 16th cabled to the President of the United States Senate a protest against the hasty recognition of “a barracks *coup*” in Panama, expressing a hope that the Senate and the people of this country would admit their obligation to assist Colombia in maintaining the integrity of her territory and repressing the insurrection. “In thus demanding justice,” said he, “Colombia appeals to the dignity and honor of the American Senate and people.” At the same time, the Colombian authorities cabled from Bogota to London for publication a long message purporting to give the substance of a protest addressed to our Government by President Marroquin, who is said to have asserted that our Government is responsible for the secession of Panama because it fomented the separatist spirit, hastily acknowledged the independence of the revolutionists, and prevented Colombia from suppressing the rebellion. He desires this protest to be known throughout the world.

Cuban Reciprocity in Congress

At the opening of the extraordinary session of Congress, on the 9th inst., the desks, and even the chairs, of many members were covered with flowers given by their admiring friends. Owing to Senator Hanna's recent victory in Ohio, the floral offerings in his honor were noticeable for their profusion and beauty. Some of those who approved Representative Baker's rejection of a railroad pass had placed at his desk a floral railway locomotive six feet long. The closing of the restaurant bars (owing to the prohibitory legislation of the last session) did not escape the attention of members. Mr. Cannon, of Illinois, was elected Speaker, receiving 198 votes to 166 for his Democratic opponent, Mr. Williams, of Mississippi. In appointing the Ways and Means Committee, Mr. Cannon retained the old members who had been re-elected, adding five to fill vacancies. Mr. Williams leads the minority, taking the place of Mr. Richard-

son, who voluntarily retired.—In his message concerning the Cuban treaty the President repeated the arguments with which the country is familiar, saying that the proposed legislation was demanded “not only by our interest but by our honor,” and reminding Congress of the restrictions of the Platt Amendment and the granting of naval stations. “Cuba,” said he, “is loyally observing her obligations to us, and she is entitled to like treatment by us.” He pointed out that the treaty would harm no American industry, but would benefit many industries by enlarging our export trade. It was also for our interest “from the broad standpoint of international policy,” and was “desirable as a guaranty of our good faith” to the young republic. “We must help Cuba onward and upward, and in helping her we shall help ourselves. A failure to enact the needed legislation would come perilously near a repudiation of the pledged faith of the nation.”—A bill to make the treaty effective was reported on the 13th from the Ways and Means Committee by a vote of 14 to 2. It contains a proviso that the passage of it “shall not be construed as an admission on the part of the House that customs duties can be changed otherwise than by an Act of Congress originating in the House.” Ample protection, the committee says, will remain for sugar and tobacco. It is expected that a vote will be taken in the House on the 19th.—Even the labors of the Protective Tariff League have not prevented a marked loss of strength on the “insurgent” side. At the beginning of the week it was expected that nearly all of the Republicans would vote for a rule excluding all amendments, and that the bill would go to the Senate without the amendment, concerning the sugar differential, that was fatal in the preceding Congress. The House Democrats will oppose this rule, and will strive to amend by removing the differential and by excluding the clause which forbids for five years a reduction of the Dingley duty on sugar by treaty with any other country. But they have voted in caucus (95 to 15) to support the bill, even if they shall fail to amend it. In the Senate, however, there will be a prolonged tariff debate that may defer final action until the regular session.

Politics and
Kindred Topics

Inquiries made in
Washington by a New
York newspaper that

has called for the nomination of Mr. Cleveland have drawn from a large majority of the Southern Democratic Senators or Representatives who have replied, the opinion that his nomination would be sharply disapproved in that part of the country, some even saying that not one-tenth of the party would vote for him. In the South the drift is toward Judge Parker or Senator Gorman. Mr. Murphy, the Tammany leader in New York, who some time ago favored the nomination of Mr. Cleveland, is now said to prefer Judge Parker.—The President has urged Senator Hanna to retain the chairmanship of the Republican National Committee, and conduct the campaign of 1904. A final decision has not been reached by the Senator.—At the White House there has been authorized a denial of the report that the President requested the Pope to appoint an American cardinal, or that he asked that a cardinal be sent to attend the St. Louis Fair, or that any relative of his has visited the Vatican as his representative.—Action upon the nomination of Brigadier General Leonard Wood to be a Major-General has been deferred by the Senate Military Committee until changes against him shall have been heard. The opposition is led by Mr. Teller, who is said to have the support of Mr. Hanna, as the friend of Major Estes G. Rathbone, formerly Director of Posts in Cuba, who was prosecuted and convicted with Neely. Mr. Teller thinks that General Wood ought not to have been “jumped” over the heads of several hundred officers who were his seniors in the service. Major Rathbone asserts in his charges that General Wood granted or confirmed, just before the end of the military occupation of Cuba, a valuable concession to the company controlling the game of Jai Alai in Havana, thus giving the company vested rights for ten years; and that after this action was taken he accepted from the company a silver service worth \$5,000, and pearl jewelry valued at \$3,000, having caused the same to be admitted at the port of Havana free of customs duties. The

game of Jai Alai, as played on the company's property, is accompanied by much betting.—Many petitions against the admission of the Mormon Senator, Mr. Smoot, have been received by the Senate. The Salt Lake Ministerial Association asserts that polygamy is openly practiced by the President of the Mormon Church and several of the Apostles, and that this practice has the approval of Mr. Smoot. Senator Hoar recently said in the Senate that the question concerning the Senator from Utah was purely a judicial one, and that the petitions were as much out of place as similar appeals would be if addressed to the Supreme Court concerning a pending case. Mr. Dubois and others opposed this view of the matter.

In the
Philippines

The War Department has a reason to expect that a final settlement of the question of the friars' lands will be made before the departure of Governor Taft for this country, on December 23d. Owing to pressure from Rome, the price demanded by the religious orders, which was at one time \$14,000,000, has been so reduced that the Insular Government now hopes to obtain the property for about \$6,000,000.—An impressive demonstration in favor of the appointment of A. W. Fergusson, now executive secretary of the Commission, to the vacancy that will be caused by the transfer of Governor Taft to Washington, has been made in Manila by 3,000 Americans, Filipinos and foreigners, representing factions not heretofore in agreement. Telegrams in favor of Mr. Fergusson have been received from 21 provincial boards and 9 conventions of municipalities.—The anti-slavery law enacted by the Legislative Council of Moro Province has been approved by the Commission. It prohibits slave-hunting and provides for the confiscation of all vessels engaged in the slave traffic. In Mindanao, the Moros of Lake Lanao have resumed hostilities and killed three soldiers of the Twenty-eighth Infantry. In Jolo, Captain Rumbrough's battery of artillery has been attacked by the natives, who have fortified their position. General Wood reports that “the issue has been raised and must be dealt with promptly.”—From the Agricultural Association of Panay and

14,000 tobacco workmen of Luzon messages have been sent to Washington asking for the removal of all the tariff duties on Philippine products. Senator Lodge has introduced a bill repealing all of these duties, except those upon sugar and tobacco, which he would fix at 50 per cent. of the Dingley rates.—At Iloilo several followers of "Bishop" Aglipay have returned to the Roman Catholic Church. This is regarded as a severe blow to his organization, which was in a flourishing condition there.—General Allen, Chief of Constabulary, argues in his report that the number of troops in the islands (now 18,000, at 70 posts) should not be reduced, because they are needed for the restraint of intriguing Filipinos in remote districts, who are sometimes able (as was "Pope" Rios, in Tayabas) to cause fanatical uprisings and local insurrections. Rios claimed to be an inspired prophet. He organized municipal governments, had a staff of 25 Major-Generals and 50 Brigadiers, levied taxes, and led his deluded followers to believe that he would soon be King. The Philippines, General Allen adds, are the natural base for troops that may be needed in the Orient.—The Japanese Minister at Washington has received from his Government an official statement as to General McArthur's report concerning the negotiations alleged to have taken place between the insurgent commander, Trias, and the Japanese Consul at Manila. By our Government the matter was brought to the attention of the Emperor, who caused an inquiry to be made in January, 1901. Consul Hojo said that during a pleasure trip in Cavite he met Trias, who asked if Japan would supply the insurgents with arms in return for coaling stations and railroad franchises. He replied that Japan could neither give any aid nor consider such a proposition, and he advised Trias to submit to the authority of the United States. Altho nothing to the discredit of Hojo was disclosed by the investigation, the Japanese Government deemed it expedient to transfer him to another post.

Porto Rico and Cuba

In his annual report, the Governor of Porto Rico says that the situation is one of hope. Proof of progress is to be seen, and of a strong current in favor of

Americanism, notably in the establishment of free schools, the adoption of American codes, free elections, and uniform tax laws, and the use of the writ of habeas corpus. At last accounts 70,000 children were attending the 1,014 schools, in support of which the year's expenditure was \$547,000. An encouraging growth of commerce is shown in the increase of exports from \$12,309,000 to \$14,866,000; and for the first time the balance of trade is in favor of the island, the excess of exports having been \$687,000. "Law, order and peace," says the Governor, "have been successfully maintained, with no aid whatsoever other than the regular constabulary of the island, which is a body of native born men." He recommends that corporations be permitted to own 5,000 acres of land, instead of only 500.—The postmaster of San Juan, now in Washington, takes a less favorable view, complaining that Americans interested in business on the island do not reside and spend their money there. The owners of sugar plantations, he says, get rid of their incomes in the States or in Spain. He hopes the erection of large hotels will make the island a popular winter resort.—The Cuban Congress has voted \$50,000 to Gen. Maximo Gomez, as a testimonial of gratitude to the old commander of the revolutionary army, who is said to be in straitened circumstances. President Palma recommends that \$1,500,000 a year be spent in making roads.

The Hague Trial Ended

The Venezuelan Arbitration Tribunal adjourned last Friday, after having set during the week and heard all the oral arguments from the Allied Powers and the Peace Powers. The court notified those interested that the complete statements of claims might be deposited with the Secretary-General up to December 15th, inclusive, and after that the court would notify them when it was ready to render its decision. Judge Penfield, in closing for the United States, maintained that the Allies, in the protocol of February 13th, abandoned all their claims for privileged treatment, but whether the court's decision was favorable to this country or not, the United States would remain faithful to the cause of arbitration. Sir Robert Finlay thanked

the court in behalf of the Allied nations and the President, M. Mauravieff, expressed his thanks to the counsel for their assistance, and assured them that they could depend on the court's best efforts to find a verdict in accordance with the laws of equity. The counterpleas of the original briefs that were handed in to the court have now reached this country, and show that the arguments of the Allies are merely an elaboration of their contention that Venezuela was only compelled to pay her debts by the show of force; and that, therefore, the Powers that were compelled to go to the expense of bringing pressure to bear should have preferential treatment. Germany made the additional plea that the hostile acts of the Allied Powers benefited the Peace Powers. To this Mr. Bowen replied:

"If the Peace Powers had taken sides, some with the Allied Powers and others with Venezuela in order to protect their interests political and commercial, the war would have been infinitely more extensive than it was. To avoid such a general war as that, the Allied Powers would, without doubt, have been more than willing to abandon their claim to preferential payment."

In Italy's brief there also occurs this statement:

"It is also necessary to remember that Mr. Bowen was the diplomatic representative of the United States at Caracas, and that he is an American citizen."

To which Mr. Bowen rejoins:

"Just what Italy means by this final note of warning, it is difficult to imagine. Perhaps it refers to the fact that when the diplomatic representatives of the Allied Powers left Caracas, he was called upon to take charge of the interests of the Allied Powers in Venezuela and to protect their subjects there. If he could perform those duties for the Allied Powers, certainly he could represent Venezuela in the settlement of her troubles also. At all events, he is not unwilling to be remembered as the diplomatic representative of the United States at Caracas and as an American citizen."

The majority of the claims of the various Powers have now been adjudicated by the Mixed Commissions sitting in Caracas, and in almost every case the claims amounted to a sum vastly greater than what was finally awarded. They are as follows:

To France, \$540,000, as against a claim of \$2,600,000.
 To Germany, \$384,000, as against a claim of \$1,200,000.
 To Great Britain, \$120,000, as against a claim of \$225,000.
 To Spain, \$380,000, as against a claim of \$2,500,000.
 To United States, \$513,000, as against a claim of \$15,390,000.

Santo Domingo The revolution in Santo Domingo seems to be all but completely victorious. Ex-President Jimines has left Porto Rico and is reported about to land on Santo Domingo shores, where he has already been proclaimed President. The capital city of San Domingo has been captured by the insurgents, altho there is still considerable desultory fighting about the suburbs. The insurgent gunboat "President" has shelled one or two towns at only a three-hours' notice, and on one occasion has intercepted an American blockade-runner, which was afterward escorted out of port by the "Baltimore." Minister Powell has, as yet, refused to recognize the insurgent government, but what his subsequent course will be is not known. This action of the Minister has caused an intense outburst of indignation against the United States. Already two German men-of-war have arrived, and, naturally, business and commerce are at a standstill.

The German Emperor It is now known that only the Empress and Chancellor von Bülow were informed that an operation was to be performed on the Emperor. The physicians, however, have been aware for some time that it would be necessary to operate on his throat, and Dr. Schmidt had made an examination of the larynx two months ago with this intention. An article in the *Frankfurter Zeitung*, presumably written by Dr. Schmidt himself, gives the following account of the operation:

"The polypus had no stem, as usually is the case, but spread itself on the edge of the left vocal chord. For this reason the operation was more complicated than with an ordinary vocal-chord polypus, inasmuch as it required cutting around in order to make a stem.

"Cocaine took effect on the patient excellently, so that Dr. Schmidt could use a laryn-

geal knife with precision and separate the polypus from the adjacent tissue, with the exception of a slight ligament. He then inserted a laryngeal forceps and extracted the whole polypus at the first effort. The Emperor made no disturbing motion. The bleeding was somewhat profuse, but it did not require special treatment to check. As the entire left vocal chord was inflamed and reddish before the operation, it will take considerable time to restore the normal condition. Such an affection of the chord is nothing unusual. It is no sign of a more serious disease."

The Emperor is doing well and transacts a certain amount of business. He is enjoined not to talk above a whisper, and the impetuosity of his nature renders such an injunction extremely irksome to him. While consulting with his advisers he frequently throws away the tablets on which he writes questions and answers and begins to talk. All the physicians connected with the case state most emphatically that the growth was benignant and that there is no reason for alarm. The editorials in the leading medical journals accept these statements as trustworthy, but still point out the unexpected turn to the Emperor Frederick's case. It is probable that Emperor William will not be permitted to speak so commonly in public, as the disease arose from straining the vocal chords.

Agriculture in the United Kingdom

The Board of Agriculture has issued the annual tables showing the acreage under crops and grass, as well as the number of domestic animals classed as live stock, in each county of Great Britain. These new records supplement the preliminary tables published in August and September. Accompanying the present tables are interesting memorandums touching on the changes that have taken place in Great Britain this year as compared with last. A distinct feature of the returns now made available lies in the fact that announcement is made for the first time of the acreages of crops and the number of stock in 1903 in the United Kingdom as a whole, including the Isle of Man and the Channel Islands. The acreage of corn crops, wheat, barley, etc., shows a diminution of 124,182 acres, and this year's area, returned at 8,392,863 acres, is the lowest on record. As recently as

1894 the extent of land under corn crops was a million acres more, and if the records of the year 1869 are examined it will be found that there were then upward of 12 million acres carrying corn crops in the United Kingdom. The present year's area is shown to be 4,256,999 acres of oats, 2,021,771 acres of barley, 1,621,039 acres of wheat, 241,929 acres of beans, 181,928 acres of peas and 69,197 acres of rye. This year's extent of green crops comprises 1,898,862 acres of turnips and swedes, 1,195,879 acres of potatoes, 478,386 acres of mangel, 231,717 acres of cabbage, 147,949 acres of ratches or tares, and 193,934 acres of other crops, including carrots, parsnips and the like. The extent of land occupied by clover, sainfoin and grasses under rotation occupies a position about intermediate between that of corn crops and that of green crops. All the acreage, however, shows a falling off. Small fruits are the only things that show any increase in acreage. Fifty-eight thousand one hundred and seventy-three acres are added to the extent of bare fallow, and this year's record of 356,705 is the largest since 1898. Horses, cattle and pigs show a large increase in point of number this year over last year. There is a decrease of 397,916 in the number of sheep.

Russia and the Far East

From all accounts it appears that the circles of peasants who meet to discuss political matters, often in a thoroughly revolutionary spirit, constantly increase. Incendiarism is also increasing, and the authorities strive to lay the blame of these barbarous acts on the political clubs. Recently nine peasants were tried at Petrovsk on charges of incendiarism.—While the Czar was recently at Darmstadt (where he had the memorable conversation with M. de Witte), a committee of exiled Finns sought an audience with him, but were refused. He did, nevertheless, accept a written memorial, the text of which has just reached this country. In this memorial the committee assert that his Majesty's consent to the anti-Finnish measures of the Russian Government was secured by Minister von Plehve's false interpretation of the laws and distortion of the facts. They declare that the measures

adopted in the past five years have undermined the independence and impartiality of the courts, substituting therefor the arbitrary will of the Governor. State officials act at the behest of the Governor and do not hold office in accordance with their services to the state, the old right of prosecuting officials for infringement of the law being abolished. Another evil is that offices have been given to Russians who are ignorant of the laws and civil conditions of the country. The military law, which was sanctioned by the Czar's grandfather, with the assurance that it should remain in force until constitutionally abolished, has been removed by a one-sided Government decree, so that now Finnish young men are forced to serve in Russian regiments. All rights guaranteed by Alexander I and reiterated by his successors have now been disregarded in order to make room for autocratic government. The Governor has carried his dictatorial power to the greatest extreme, outlawing peaceful citizens who refuse obedience to unconstitutional acts and pursuing them as criminals, subjecting citizens to a shameful system of espionage, searching their houses, and creating a condition similar to that which obtains when a hostile army invades a country. The system, the memorialists assert, has promoted a degree of corruption such as was never known before. It is not often that such plain speaking reaches the Czar's ears, and his visit to Darmstadt must have been a season of enlightenment for him. Another result of his visit abroad is a confirmation of Foreign Minister Lamsdorff's more peaceful policy. Admiral Alexieff, the Viceroy of the Far East, was exercising an independent course in Manchuria without regard for the Foreign Office and causing Count Lamsdorff no little embarrassment. What the Czar heard during the trip coincided precisely with the Count Lamsdorff's counsels. It is known that the Czar sent a telegram to Admiral Alexieff ordering that there should be no war. The real struggle over the Manchuria question will come early next month at the meeting of the Committee of the Extreme Orient, when Admiral Alexieff will be present to give his views in person. Meanwhile the war peril grows daily less.

Two Consistories Pope Pius X held his first Secret Consistory on November 9th. His appearance before the College of Cardinals in the Hall of the Consistory was striking, clad as he was in the full pontifical robes which are used only at the first Secret Consistory in each Pontificate. In addressing the Cardinals, the Pope spoke first of his unwillingness to assume the office, and of his hopes that he might succeed in the arduous duties. "For truth's sake," he said, "it is necessary that in governing the Church the Pontiff should appear to be free, and not the subject of any Power. But this is not the case, and that is what we lament as being a grave injury to the Church." He asserted that the Pope, in his office, could not separate the Faith from politics; therefore, as he was the sovereign ruler of the most perfect society instituted among men, he must wish that peaceful relations should exist between himself and the princes of the world. After his address he made the appointment of two Cardinals, Monsignor Merry del Val, the Papal Secretary of State, and Monsignor Callegari, Archbishop of Padua. These appointments were confirmed by the Cardinals by raising their caps. The first Public Consistory was held three days later, when five Cardinals, including Merry del Val, received their red hats. The city of Rome was in a state of some little excitement over the event, and early in the morning all the thoroughfares leading to the Vatican were crowded with people and carriages. The ceremonies began at 10:30, and are described as being magnificent in appearance. The Pope, clothed in full pontifical robes and miter, with the immense emerald ring on his finger, was born in the *sedia gestatoria* by eight scarlet-clad men, and impressed the audience by the dignity of his mien. After the Pontiff took his seat on the throne at the end of the Hall, the new Cardinals were introduced to him by the Master of Ceremonies, and knelt, one by one, while a Cardinal's hat was held over their heads. After the salute to the Pope and to the other Cardinals, they took their places among their brothers, and the Pope, having bestowed the Papal benediction, withdrew amid loud acclamations.

The Literary Production of the World

BY A. GROWOLL

EDITOR OF "THE PUBLISHERS' WEEKLY"

MUCH of the most wearing work accomplished in the world is dedicated to the gathering, weighing, comparing and authenticating of statistics. In this busy, hustling age the men that are to the fore in shaping the progress of the world must depend more and more upon others for the facts, figures, accurate information and formulated deductions upon which they build the plans, inventions, discoveries and fortunes at which the world wonders.

At fabulous expense and with keenest ingenuity the statistics relating to the material productions of the discovered lands of the earth have been compiled by conscientious, undaunted enthusiasts, many of whom have sacrificed their lives to verify a theory or demonstrate a fact.

And what becomes of these statistics, to which so much mental and physical force is devoted?

First and foremost they are put into print in books, newspapers or magazines and thus become an integral part of the literary production of the world, for statistics to-day are not merely rows of figures, but mines of information from which are drawn much of the mental light and moral purpose of humanity.

Since, then, it is printed matter that preserves to our use all the fruits of the mental and physical progress of the world, it would seem of interest to get a true perspective, founded on statistics, of the mental productions of the civilized world as they appear in the literary output of the various countries.

Current thought and estimate on this subject are of the vaguest. Every one knows that literary production of recent years has grown to proportions almost too vast to be computed; but very few people have an estimate within several thousands either way of a year's publications of any one country, not even of their own.

World statistics of publishing that have been tried and not found wanting

are as yet not available. During the current year the official organ of the German book trade made an exhaustive study of the subject; the official organ of the Berne (Copyright) Convention has for several years attempted a report of the world's literature, and *The Publishers' Weekly*, one of the book trade journals of the United States, year by year gives statistics of American book production and a *résumé* of the literary production of the world. But one and all acknowledge that, in default of an international standard of uniform classification, in view of the unsettled questions as to the meaning of edition, new edition and new issue, and in view of the large output of ephemeral publications of which some countries make a record and others do not, it is not yet possible to compile wholly accurate statistics. A study of the careful work of these authorities and a consideration of their conscientious scruples in vouching for the figures leaves the conviction that for the average reader much very interesting information may be gleaned from the material which as yet does not satisfy enthusiastic experts.

It has long been the dream of bibliographers to record in one vast bibliography all that has thus far been printed in the world. The Dresden International Copyright Congress in 1895 held that it was of international interest to have a universal catalog of scientific, literary and art works that have appeared in the whole world. This is a plan of real importance, but untold obstacles as yet stand in the way of its realization. National bibliographies for each country must first be created and maintained. The cost of the work required for this purpose and its slight appreciation by a very small constituency make even these preliminary steps toward international bibliography very faltering ones.

The following table shows the yearly output as it has been compiled for the

larger countries. Where blanks take the place of figures the information gained was not in any sense trustworthy.

	Books and pamphlets.	Year.	News- papers and peri- odicals.	Year.
Germany	1902	26,906	1902	8,049
Japan	1899	21,255	1899	978
Russia	1895	17,895	1900	1,000
France	1902	12,199	1901	6,681
Italy	1900	9,975	1900	2,757
United States.....	1902	7,833	1900	21,000
British India.....	1891	7,700	1899	1,000
Great Britain.....	1902	7,381	1902	4,943
Austro-Hungary....	1899	5,000	1901	2,958
Holland	1901	2,837	1898	980
Belgium	1901	2,688	1899	956
Rumania	1901	1,739	1901	320
Sweden	1900	1,683	1896	350
Switzerland	1900	1,500	1902	1,005
Denmark	1901	1,249	1896	230
Spain and Portugal.	1897	1,200	1900	1,430
Turkey	1890	940	1892	300
Argentine Republic.	1886	716	1886	716
Norway	1901	540	1900	450
Canada	1893	449	1893	900
Chile.....	1891	385	1896	310
Egypt	1898	160	1903	120
Iceland	1899	146		
African countries..			1892	190
Australia			1903	1,000
Brazil			1902	300
Bulgaria			1897	89
China			1902	28
Ecuador			1894	38
Finland			1901	203
Greece			1895	131
Mexico			1892	307
Persia			1892	12
Servia			1897	78
Siberia			1893	24
	132,376		58,794	

It is so difficult to get at the statistics of literary production year by year that it stands to reason that an estimate of the entire literary production of the world to the present day can only be relative and largely a matter of expert opinion.

Paul Otlet, the Secretary of the Brussels International Bibliographic Institute, estimates the number of printed books since the invention of printing to January, 1900, at 12,163,000 separate works, and the number of periodicals at between 15 and 18 millions. *The Publishers' Weekly* in an article on "The Fallacy of Book Statistics" pointed out how almost impossible it is to even gauge the entire book production of the earth. And even if the figures could be arrived at they would give us no accurate picture of the mental activity of authors and writers.

This must be left to the historian of literature. Even if statistics can show the number of new editions and new issues and the number of translations, they cannot show the value of the books as original works, compilations, imitations, etc.

Peygnot and Otlet have estimated the number of books to 1898. For the following years Otlet adopts 200,000 as a yearly average. This seems rather high, and the figures of the table, which would make 150,000 per year a good average, seem more reliable. This would give the following schedule:

1436-1536.....	42,000
1536-1636.....	575,000
1636-1736.....	1,225,000
1736-1822.....	1,839,000
1822-1887.....	6,500,000
1887-1898.....	1,782,000
1899.....	150,000
1900.....	150,000
1901.....	150,000
1902.....	150,000
1903.....	150,000
	12,713,000

To the year 1904, therefore, upward of 12½ million of separate works have appeared in the world, which figures, however, include new editions and translations.

Otlet also estimates that since the introduction of printing the following percentage of different classifications of subject matter has held good:

Law and Sociology.....	25.42
Literature	20.46
Applied Science.....	12.18
History, Geography.....	11.44
Theology, Religion, Speculation.....	10
Miscellaneous and Bibliography.....	9
Philology and Languages.....	4.08
Natural Sciences.....	3.44
Art	2.62
Philosophy	1.36

As detailed statistics are only available for single countries, this must also be looked upon as an approximate estimate. In point of number of output, Germany and German Austria collectively yearly lead the world. Then follow France, Italy, England, the United States and the Netherlands. In speaking of classification and comparative mental value of publications, Russia and the Oriental countries are not taken into present consideration.

In creative works England leads the world, having by far the largest output

of novels, romances and works of pure imagination. In Germany educational works, theological works and books for the young predominate. The largest number of historical works appear in France, and Italy leads in religious publications. The largest number of books published in the United States fall in the department of fiction, but works of fiction are generally duplicated in the English and American statistics, as novels of merit written in the English language almost invariably appear on both sides of the Atlantic.

According to Professor Otlet it may be roughly estimated that at the present rate of publication the average of books produced to every million inhabitants stands as follows in the most highly civilized countries of the world:

1 German Empire.....	354
2 France	344
3 Switzerland	338
4 Belgium	337
5 Italy	309
6 Sweden	300
7 Norway	262
8 Great Britain.....	175
9 Russia	85
10 United States.....	81
11 Spain	66

The book trade throughout the world is suffering from overproduction, and the quality of the literature produced is deteriorating. Almost 80 per cent. of the new books are superfluous, as they are either of mediocre merit or distinctly worthless, and do not in any way add to the treasures of literature. In many of the departments of literature the bulk of the new volumes are only a reshaping, condensing or expanding of already existing material.

It seems safe to say that books number about two-thirds and newspapers about one-third of the entire literary production of the world. Of course, in the quantity of manufacture the periodicals far outnumber the book production. As far back as 1882 a calculation was made of the percentage of periodicals according to the languages in which they appeared, which resulted as follows:

	Per cent.
English	48
German	23
French	11
Spanish	6
Italian	2
Other languages.....	10

Professor Otlet made his estimate of the average of periodicals to a million inhabitants in 1898 as follows:

1 United States.....	510
2 Switzerland	320
3 Belgium	253
4 Holland	184
5 Germany	161
6 France	156
7 Great Britain.....	113
8 Austria	98
9 Chile.....	88
10 Italy	78
11 Russia	77
12 India	33
13 Japan	17
14 Egypt	11

The various tables, as already pointed out, show that Germany leads the world in book production, and that the United States leads the world in the production of periodical literature. Germany is the land of thinkers, the United States the land of readers. The vast distances of our country and the constant travel that has built up the far-reaching interests of our commerce have led to the American habit of newspaper and magazine reading. Everybody reads every minute, and everybody reads his own paper that embodies his special views of politics or religion, or deals with the subject from which he procures his means of support. Everything is wanted as soon as it is known, and the most valuable contributions to knowledge on all subjects generally appear first in the periodical literature, that has been conceded by many publishers to be far more profitable than books.

The vast literary production of the world has naturally led to the growth of various manufactures that have made important changes in the economic conditions of many countries. The manufacture of paper has become an industry of enormous importance, as has also the manufacture of type and the various inventions that have taken the place of type. The manufacture of books and periodicals, their sale and circulation, employ great armies of men and women, and certainly in material ways the world is benefited by its fabulous book production.

Publishers now seek authors to write on order books for which there seems to be a probable demand, and there is growing danger that the writing as well

as the manufacture of books may become just one of the many means of material support.

All the world takes pride in increase; but in the matter of mental production quantity does not necessarily make for the highest results. The great increase in useful, technical and educational lit-

erature serves an important temporary purpose; but it would be well for the civilized world to call a halt on the phenomenal output of mediocre books that can have no lasting influence on the true culture of the world, from which must come at last the true freedom and universal peace.

NEW YORK.

Russia and Macedonia

BY GEORGE WASHBURN, D.D., LL.D.

PRESIDENT OF ROBERT COLLEGE, CONSTANTINOPLE, TURKEY

RUSSIA is the one implacable enemy of the Ottoman Empire about whose policy in the past, present or future there is no doubt. At a given

time she may pose as the friend and even the defender of this Empire, but no one is deceived, least of all the Turk. Turkey is her prey; she may defend it against others, but only that she may consume it all herself. Her plan is formulated in the testament of Peter the Great. This document is apocryphal, but it is a faithful statement of the interest and the policy of Russia. Russia does not follow this policy because Peter the Great recommended it, nor because it is the traditional policy of the Asiatic Section, the branch of the Government which has long controlled the relations of Russia and Turkey. This plan represents the natural aspirations of the Russian people and the natural growth of the Empire toward the open sea. Russian statesmen may direct this natural movement, restrain it at one time and press it at another, but they cannot stop it. Every Russian *moujik* looks to Constantinople as one of the holy cities, the cradle of the Orthodox Church. Every Russian soldier looks upon a war with Turkey as a holy war. There is no country where religion occupies a greater place in the thoughts of all classes than it does in Russia, and the Grand Duke Nicolas spoke to the hearts of his soldiers in 1878 when, in an order of the day, he said:

for conquest that we march, it is to defend our down-trodden and insulted brothers, to defend the faith of Christ. Forward! Our cause is holy, and God is with us."

There is nothing savage or even unchristian in this religious sentiment which presses the Russian people toward Constantinople. The Turkish prisoners in Russia during the last war were treated so kindly by the people that many preferred to remain there after the war.

The geographical position of Russia furnishes as strong a motive, in its way, as the religious feeling. Altho St. Petersburg is the capital of the Empire, it is not in the frozen seas of the North that we look for the center of the power, the wealth and the commerce of Russia. The Black Sea is the true center of the Empire. When it was a Turkish lake Constantinople naturally went with it, but that Turkey should now bar the way to the open sea to the most powerful Empire in Europe is an anomaly which it is not easy for any Russian to tolerate. From a military point of view the possession of the Bosphorus and the Dardanelles is of the first importance to Russia for defense as well as for aggression. All the dreams of panslavism also center about Constantinople. As Napoleon said at St. Helena: "Constantinople is made to be the center and seat of universal

"War is declared against Turkey. It is not

dominion. I do not regret that I gave up the empire of half the world rather than give that city to Russia." The great Turkish statesman, Fuad Pasha, said in his political statement: "The extension of Russia toward the West is the inflexible law of Russian destiny. If I myself were a Russian Minister I would overturn the world to capture Constantinople."

It is the policy of Russia to destroy the Ottoman Empire and take Constantinople, but she is in no hurry about it. Since the days of Catherine the Great she has learned from experience what obstacles stand in her way. She is further from Constantinople now than she was fifty years ago. Then Turkey was her next neighbor in Europe; she had but to cross her frontier and defeat the Turkish armies to march through a friendly country all the way to the Bosphorus. Now this European road is barred by Rumania and Bulgaria, neither of which states wishes to see Russia in possession of Constantinople. They could not stand alone against Russia, but Rumania belongs to the Triple Alliance and would be supported by it. Bulgaria might be bribed to join Russia after the Russian armies had crossed the Danube. In one respect Russia is as well off as she was before the Crimean War. She has a powerful fleet in the Black Sea, but, on the other hand, the Turks are much better able to resist any attack upon the Bosphorus defenses. Russia is not likely to make another advance upon Constantinople by the old European road unless she can secure the active support of Austria and make some arrangement with either France or England. Since the last war she has been the most active defender of the Turks against foreign aggression. It was her threat to send her fleet to the Dardanelles to aid the Turk that prevented an intervention of England in behalf of the Armenians. She was hostile to the Greeks in their war with Turkey, and she has defended the Turks against all European pressure in favor of radical reforms. She entered into a compact with Austria four years ago to keep Macedonia quiet, and forced the Bulgarian Government to restrain the revolutionary committees which were making trouble there. But

no one is deceived by this apparent friendship for the Turks. She is steadily preparing the way for an advance through Asia. It was no friendship for Turkey which led her to encourage the Armenian massacres. It was in her interest to prevent the establishment of an autonomous Armenia on her Asiatic frontier, especially if this were to be under English patronage. In the spring of 1900 she took a step in advance and forced the Sultan to recognize Armenia and Eastern Asia Minor as the sphere of Russian influence, in which no other Power could build railways or make other improvements. She encourages the Sultan in everything which creates trouble in his Empire, excites the hostility of other Powers or wastes his resources. She is steadily strengthening her fleet in the Black Sea and has built railways so that an army can be quickly concentrated on the Turkish frontier near Erzroom. In this way she is at once undermining the power of Turkey and preparing the way for her own advance when the favorable moment arrives.

The policy of Russia in regard to the new Christian states is complicated by the fact that, while Greece is Orthodox, she is not Slavic and is in close relations with the Western Powers. The same thing is true of Rumania. The object of Russia is to bring all these states under her immediate control, to make them feel that they are dependent upon her, that they have nothing to hope for so long as they do not submit to her dictation. Rumania and Greece have other ambitions, in conflict with the plans of Russia. Bulgaria, Servia and Montenegro are both Orthodox and Slavic, but they have no desire to be absorbed in Russia. They prefer independence and hope to be aggrandized by the spoils of Turkey. Up to the present time Russia has not been very successful in dealing with these states. She has made endless blunders through her failure to understand and accommodate herself to the spirit of the people. They fear rather than love her. Still it is probable that in her next war with Turkey she will be able to count upon the support of Bulgaria. The action of the other states will depend upon the attitude of Austria.

If Russia could secure the alliance or even the assured neutrality of Austria she could do what she pleased with European Turkey. The present alliance is hollow and limited. There is no reason to believe that she will ever allow any settlement of the Macedonian question until she can settle it in her own interest. It is the only fund from which she can draw to win over Austria or satisfy the ambition of the Balkan states when she makes her final descent upon Turkey. It is doubtful whether she will ever give Salonica to Austria except in exchange for Constantinople. For several years past it has seemed to be her chief desire to bring about a reorganization of the Orthodox Church in Turkey. Altho the Bulgarians are Orthodox, they are held by the Church in Turkey to be schismatics, under excommunication, and there has long been a fierce conflict between the Greeks and Bulgarians in Macedonia. At the bottom it is a political and not a religious conflict, the Greek Patriarch of Constantinople seeking to Hellenize the Christian population and the Bulgarian Exarch seeking to Bulgarianize them. It is with this object in view that the head of the Bulgarian Church resides in Constantinople and not in Bulgaria. Now Russia seeks to put an end to this conflict, remove the excommunication, send the Exarch to Bulgaria, give the Bulgarians full representation in Holy Synod at Constantinople, and leave the people of Macedonia free to elect in each place whether they will have their Bishops and their services Greek or Slavic, all to be under the Patriarch of Constantinople. This would not only remove a scandal from the Orthodox Church in Turkey, but it would put an end to the Greek, Bulgarian and Servian propaganda in Macedonia, and relieve Russia from one of her principal difficulties in Turkey, the difficulty of deciding which of the three parties she will support against the other two. Her influence would replace that of the three states in Macedonia.

It cannot be denied that Russia is chiefly responsible for the present state of things in that blood-stained province. In playing her game she saw fit last year, at the time of the Shipka celebration, to make the Bulgarians and Macedonians

believe that she was ready to aid them in their plans for the relief of Macedonia, and the present revolutionary movement dates from that time. But no sooner did the fighting begin than Russia not only permitted but encouraged the Turks to crush the movement with an overwhelming force. She had no more sympathy for Orthodox Slavs than she had seven years ago for the heretical Armenians. No ties of race or religion count for anything with the Russian Government when her political interests are in play. The Christian world looks on with amazement, but it is an old story. We have seen it acted over and over again in Crete, in Greece, in Bulgaria. It is true that Russia did free Bulgaria, but one of her most distinguished generals told the Bulgarians after the war, with brutal frankness, that if they thought that Russia had expended all this money and sacrificed all these lives from any interest in them they were very much mistaken. She simply wished to use them to make a bridge to Constantinople. So long as they did not choose to be made a bridge they had nothing to hope from Russia. In 1885, when they united Eastern Rûmelia to Bulgaria, without the help of Russia, she tried to crush them. She insisted upon the Sultan sending an army into Eastern Rûmelia, and when this failed through the determined resistance of England, she sent Servia to attack Bulgaria, after she supposed that she had paralyzed the Bulgarian army by suddenly withdrawing all the Russian officers and leaving it with no officer higher than a captain.

We do not know exactly what the plan of Russia is now, but it is easy to see what she has gained by encouraging a revolution and then allowing the Turks to devastate the country. She has forced Turkey to make enormous sacrifices to put in the field and support an army of 350,000 men far away from the Russian frontier. She has humiliated Bulgaria and made all the Balkan states understand once more that they are helpless unless they follow the lead of Russia. She has made Europe understand that the fate of Macedonia can only be settled by Russia. What she will do next is probably still a problem in Russia. It will be decided by the course of events

here and in the Far East. It is the general impression in Constantinople that she hopes to have Turkey declare war against Bulgaria, as this would give her

an excuse for armed intervention, after the Bulgarians have been sufficiently punished to make them humble servants of Russia.

CONSTANTINOPLE, October 5, 1903.

Typographical Effect

BY THEODORE L. DE VINNE

[Mr. De Vinne, besides being a leader in the improvement of typography, is perhaps the best known printer in this country. He has lectured upon the art of printing before the Grolier Club, and is the author of several books on various typographical themes. He is the American authority upon his subject.—EDITOR.]

EVERY writer for print wants to be read, but not every one uses wise methods. Too many are like the advertiser who wants screaming type, the head of the column and the page oftenest read. The reader cannot be trusted to give to written words proper distinction and emphasis. Plain roman and italic types, that have preserved the literature of the world for centuries, and that are always preferred by authors who have something to say and know how to say it, are put aside as insufficiently emphatic.

One hundred years ago or a little more, when types of display were not in general use, the coveted emphasis was produced by a liberal sprinkling of italic and capitals. Every noun (and sometimes verbs, participles and adjectives) was graced with the larger style of letter. Words of imagined significance in the text must be in italic; those of superior distinction in small capitals; the names of magnates in dedications and writings of like nature in the largest capitals, with spaces between the letters. Print so treated was confused and irritating to eye and mind. Many years lapsed before the author discovered that profuse emphasizing was an insult to the reader's intelligence. It was practically an attempt to treat him as a child—to cut up and pepper his literary food regardless of his likes or dislikes. Have we entirely outgrown the desire for needless distinctions? The linotype typesetting machine has curbed profligacy with italic, but the fencing-off of hackneyed phrases

is as common as ever with undisciplined writers.

Types of display, under which name may be grouped all bold faced letters based on the roman model, came in general use about the year 1820. Old-fashioned printers denounced them as monstrosities, but they were not squelched by scolding. In commercial printing, and even to some extent in good book work (as in the index words of dictionaries) they proved of real service. Soon followed ornamental types in imitation of the letters of lithographers and copperplate printers, and they paved the way for type-metal flourishes, curved lines, twisted brass rules, panel work, medieval decoration and other eccentricities intended for startling typographical effect. Nor did the accepted form of roman letter escape meddling. William Morris, as radical in printing as in politics, thickened its structural lines until it was almost as bold as the antique type of job printers, who have ever since made use of its clever counterfeit as a useful display letter. It did not entirely please him; it was not gothic enough. It was to be expected that an admirer of the literature of the North over that of old Rome would extend that admiration to its gothic mannerisms. In this belief he made books after medieval models that surpassed the work of the early printers. His wonderful skill in press-work and in other departments of book-making was the redeeming feature of his uncouth Troy type and eccentricities in typesetting. Yet his experiments with

type were mischievous. It is not probable that the Troy type would have been tolerated by the critical reader if it had not been printed under his inspection. There are many readers who admire his skill and audacity, but the discreet book publisher does not copy his styles.

Yet there were amateurs who followed in the erroneous belief that the great charm of the Kelmscott book was not in its intelligent book-making, but in its quaint type. From many private presses in England and America appeared books in other styles of letter and other oddities of composition. They did not thrive. One or two attained a moderate success; the greater number have been utter failures. The reading world is not yet ready to accept a substitute for the roman character.

The superficial examination of modern printing in quaint types often leads to the belief that its legibility is produced by bold and black letters. This is an error. What is more needed is simplicity of form. The reader resents novelties in shape. Equally important is a proper relief of white space about letters. Types in a mass are not made more readable by thickening their lines and giving them bold and black faces. This experiment, tried for centuries by many able printers, has always been unsuccessful. The index word in bold type attracts instant attention in a dictionary, because it is in strong contrast with the relatively gray type that surrounds it; but if an entire page or paragraph be set in the bold-faced type, the words therein will not be more readable. It may not be so readable as a larger size of plain roman type on larger body that occupies but little more room on the paper. The lines in each letter and of each separate line of types are too close; they have no relief of white; the print seems muddy and confused. It is this huddling together of structural lines that makes all words in much pinched or condensed type of small size seem obscure. The same condensed type on a larger body may not be repelling, but it is readable only when one notes glints of white between the lines. The bolder and more compact the lines in a type, when those lines come close to the edge of the body, the harder it is to be read. Advertisers who overcrowd

the space assigned with many lines of bold display, and use leads niggardly, to the exclusion of a proper relief of white space, nearly destroy the readability they seek.

William Morris gives us a contrary teaching. He advises the use of thinner spaces between words and the rare use of leads between lines. This is good advice for compositions in black letter, a character plainly designed to show huddling and compression in every letter, but it is not at all applicable to roman letter, that is just as plainly designed to show roundness and openness. There should be as much relief of white space above and below each letter as there is within the lines of that letter. A type with a large face on a small body needs leads between lines and wider space between words. This preference for openness and clearness in roman type is almost universal. Readers want leaded type because it is easy to read; publishers order it because the book so treated finds readier sale. It is not in the power of any man, however high his rating as an artist, to reverse this judgment. Indeed, there is high authority for it. Ruskin has wisely said that "the eye is not saddened by quantity of white, but it is saddened, and should be greatly offended, by quantity of black." It is to this preference for the white letter, as roman was once called, that we may attribute the rejection of black letter as a text type.

Print is most effective when the type selected is in one style only, and when distinction or display is made with different sizes of that style. In the composition of standard books roman type serves us adequately for text, headings and title-pages. Display letters (italic and black letter are but occasional exceptions) are positively forbidden as degrading disfigurements. The superior beauty and legibility of the roman need no explanation. That it is not used more freely by advertisers is due largely to their inexperience in ordering combinations of incompatible styles, and their mistaken policy in denying a free use of leads between lines of display. This at least is certain: advertisements are not always made attractive with huge types and illustrations. When one advertiser is al-

lowed "to get ahead of other fellows" (to use his own phrase) with compositions that fairly shriek, others will follow, and the advertising pages will become a collection of shabby handbills, much to the disgust of readers. Yet display type will probably have its run in newspapers, as capitals and italic had in books. The time will come when even advertisers will see that over-display in a medley of mixed types repels more than it attracts.

Red ink lines can be used to relieve the monotony of too much gray print, but they should not be used to excess. One or two lines of red will brighten a page; too many will make that page insipid. Rubrication is like pepper and salt to food; a little is helpful; too much is worse than none at all. In all cases the type selected for red ink should have a face bold enough to fairly present vivid color. The rubrication of a hair line or the initial letter of a small capital letter is always ineffective.

A cheaper method of relieving the monotony of broad expanse of print is in the separation of its different parts, as is

done in chapters, with broad blanks of white space. When the blanks are large, making too much bleakness, decorative headbands and tail-pieces may be inserted to advantage. Here again caution is needed as to excess. Decorations for the purpose may be small and relatively plain, but they must be harmonious to produce the intended effect. They will be most satisfactory when specially engraved for a series by one competent designer. The type borders in most printing houses show no relation to one another in design, and are consequently discordant.

Newspapers that strive to make print attractive use borders about the headings of different articles that sometimes span two or more columns. For general use the article heading inclosed in a border of plain lines, followed by a plain initial capital letter that truly lines with mated text types, will be found of greatest service. The chief fault of modern typography is over-decoration, and it is shown most offensively in a jumble of unrelated ornaments, in places where ornament is not needed.

NEW YORK CITY.

Neurotic Symptoms in Recent Fiction

BY MRS. L. H. HARRIS

WHEN we think of the long time before us in which we must hold out against the powers and principalities of our darkness, sanity is the thing most to be desired,—sanity and a little dullness. For, after all, it is only the dull people who are quite sane. They do not know too much and they do not feel too much, but they are safe. Their wits are not very keen, nor their spiritual altitudes very high, but they have an ethical quality that insures moral accuracy in the long run. And it is a matter for regret that we have not more of them in this country. In Great Britain they furnish that element of gravity for the national life which makes the Englishman one of the standards of excellence in citizenship the world over. He is not

distinguished so much for his acumen and enterprise as he is for his obstinacy, loyalty to what he thinks he knows and to what he thinks he owns. Feelings and aspirations have not so much to do with his point of view; he has attained and adopted the commonplace for his heritage, and has spent several centuries integrating and dramatizing it into the social, religious and political life of his country. His best literature is an expression of it. And he never is betrayed into the heroic pose except in its defense. He has an imagination only potentially, for his self-respect consists in sitting upon the lid of it. And if he persists in this admirable stolidity, there is no predicting how long he will last!

But no such state of affairs exists

among us. We are more brilliant than sane, more enterprising than provident of our nervous energies. The explanation is simple, of course, but the remedy lies in a restraint which does not appear to be characteristic of Americans. This is a new country, and many a man born here feels that he has not "arrived," because there are more ages before him than history behind him. Nationally, he is a mere youth, with too much pioneer oxygen in his atmosphere. The lack of solidity which time alone can give to his intellectual, social and political foundations is disconcerting, and he longs to record in deeds more centuries to his credit than he deserves. He is determined to outdo the rest of the world, and he has already accomplished too much that is incredible. Thus, we have a nervous disorder in this country which has been mistaken for laudable ambition. Really, it is the diathesis of a national insanity that may eventually imperil the safety of our institutions, and that is already proving injurious to those delicate expressions of art which are the pressed flowers of time, the sculptured symbols of our civilization that will hereafter denote our qualities. We are succeeding best at those things which are accomplished by shrewdness and energy. Our sense of proportion is exaggerated by too much enthusiasm, and a too blatant patriotism usurps the place of quieter culture. We have a noise of progress that has destroyed dearer peace and repose. There is less and less place among us for the decency and silence of mental reservation, and we are reaching that stage of malady where we are disposed to reveal too much that in normal life is ignored or hidden, a purely neurotic symptom, easily recognized as such.

Now, it is natural that this American psychosis should be a feature of current fiction, where the undisciplined imagination throbs like a fever pulse of the times; and some symptoms of it furnish the basis of this article.

In the first place, it will be observed that in novels of this class the neurotic condition is generally founded upon the sex element. Only a few authors venture to include the religious interest in this hectic demonstration of human passions. As a rule, a sickly yearning for

the "unutterable" takes the place of action and healthy aspiration in these books. In "The Story of Mary McLane" we have an indecent exposure of an erotic temperament. Such types have always existed, of course; but the question is by what influence was the intelligence made to seize upon these secrets of a depraved nature and interpret them aloud? What is it in American life that gives courage for such a performance? We have too much enterprise in sensations. And in these feverish times we have made too free a use of our wits in the lower regions of existence, so that we are becoming too well informed as to what lies in our darkness. Formerly there was a simplicity in vice, an objectivity that evidenced and defined it, but this extension of mind into the nervous centers of passion has given a neurotic genius to its very weakness. It has added an accusation to consciousness and discovered to every reader of fiction the psychic regions of a new kind of criminality.

We expect to find in the fiction of older countries, like France, more or less diseased romances of love and life. For here the national nerves have long been sensitized by sentimental vice, and the intelligence corrupted by the study of it. The people's brain-cells are multiplied in a fetid atmosphere, and their peculiar damnation is the production of such writers as Zola, who had a genius for obscenity and for depicting all that was abnormal or immoral. But in America, where the very heart of man is still young, where the earth is virgin, and nature the bravest of all heroines in the conditions she provides, this evil precocity in sensation intimates premature senility,—exactly what might be expected from the restless fury of our ambition to advance in the scale of things. Our epics have never been translated into speech, our poetry is by no means equal to the snow-capped peaks of the situation, our romantic scriptures ought still to be in the pastoral stage,—and yet we have already a Caliban genius, with nerves sufficiently diseased to give an emotional interpretation of the mob and all that goes with it, free love, anarchy and materialism! And not a genius commensurate with the monstrosity either,

but one of the primer kind, peculiar to a new country, where the average reader's critical faculties are not developed sufficiently to demand that these indecencies shall be served in excellent literary form, as they are in France, where this is a vocation as well as an art. "The One Woman" is indeed the best illustration we have had this year of neurosis in fiction. It has the fever, the decadence and the insanity of that disease. And it is apparent to every reader that the author rejoices in the symptoms. All his thinking is emotional, and his appeal is not to the intelligence, but to the nerves. He is the evangelist of sex sensations, and his doctrines are founded upon animal instincts. Hall Caine, another author afflicted with literary neurosis, has always written under the delusion that he had a moral idea to vindicate, and this foreign pressure upon his imagination accounts for the hysteria in his novels. It is a nervous effort to express what nerves were never meant to convey. But the case is different with Mr. Dixon; he has lifted his sense of irresponsibility to the hallelujah key. He has the nerve of perfect abandonment and the sensation of unbridled license. He has the wrong sort of "sense of humanity," and whatever he writes is apocryphal for the reason that it is founded upon the mob fallacies, the social heresies and the sexual weaknesses of his kind.

Mr. Dixon is the only novelist of the year in whose work the neurotic symptoms approach mania, but there are other writers who are more or less afflicted with the disorder. Perhaps the stories of Alice Brown show the most rapid development of it. Three years ago she could tell a tale with refreshing vigor, but now her plots are founded upon the nervous sickness of her characters. The purpose of her genius has changed from interpreting that which was strong and healthy to what is morbid. Real virtue never wrought the nervous distraction in any woman that it does in some of the longing females depicted in these books. And Arthur Stringer's heroine in "The Silver Poppy" is too anæmic in appearance, too degraded in sensation. We are accustomed to the morally scarlet woman in history, Scriptures and fiction, but literary neurosis develops the type into

such a vampire of nervous passion as we have never had before. And the natural delicacy of Mr. Stringer's perceptions has enabled him to depict such a woman with every refinement of details.

It is impossible to mention all the novels of the year that have this flaw, but they come from every other part of this country more than from the South. I do not now recall a single example of literary neurosis among Southern writers, with the exception of "The One Woman," and the scene of that is laid in New York. This is accounted for partly by the fact that the literary genius of the South has no very vital relation to realities there. And then we of the South are not introspective; our self-consciousness is heroic rather than subjective. Such immoralities as we have are actual rather than speculative. Besides, as I have already intimated, the Southern novelist is not so much an interpreter of life as he is a romanticist. His nerves are historical. He is a sort of poetaster of ideal human nature conjured forth from history and traditions. He declines with the grace of a gallant Münchhausen to recognize its darker undercurrents. The most feverish thing the hero of a Southern novel ever does is to slay his enemy with too much ostentation. But not one of them is capable of regaling himself with a purely nervous and intellectual debauch in vicious sensations. In so far as he is related to evil he is not a dramatist, but an actor. And so, if he is sometimes represented by the admiring Southern author as given to sane "gentlemanly" excesses, his nervous centers are sound,—as sound as the cool and healthy past from which he invariably springs.

And this is not inconsiderable praise when we reflect that in the North, East and West, wherever wit has been sharpened most by science, energy quickened by competitive ambitions, and intelligence deepened by study and meditation, we find a certain genius for revelation, a disposition to expose everything, from commercial facts to the nervous nakedness of the secret mind. Sexual perversity becomes philosophical and fascinating through a neurotic power of portrayal. Indeed, our scriptures of life are too much concerned with the under-

world of passions, and our gospels are too much of wickedness,—all of which is unfortunate when we remember how young we are, and how long we must

hold out against the mania and wretchedness of that darkness which is before and behind us in prophecy and history.

NASHVILLE, TENN.

Observations and Comparisons Abroad

BY BOOKER T. WASHINGTON, LL.D.

[Dr. Washington has just returned from a visit to Europe, and in response to our request to send us something suggested by his trip we have received the following.
—EDITOR.]

IN reading the life of Frederick Douglass, some years ago, I was especially struck by his description of his experiences on board the steamer during his first voyage across the Atlantic. The inconveniences to which he was subjected were most trying. At the present time, a colored man crossing the Atlantic on any of the vessels of the regular lines is treated with as much courtesy as any other passenger. The only embarrassment to which he will likely find himself subjected, in case he happens to be an individual who appears in all the public prints, is that he will be forced to deliver one of the addresses in the dining room of the cabin when the charity concert is held.

Three things seem lately to have increased the interest of Europeans in everything relating to the American negro. One is the fact that almost without exception the strong states of Europe, by reason of their colonial possessions, are coming into closer contact with the black man in Africa. As Europe is just now putting forth special effort to produce her own cotton in African colonies, and as the negro in America is the main cotton producer, the European has additional interest in everything relating to the American negro. It is the consensus of opinion that the negro has reached a higher degree of civilization in America than in any other part of the world; hence the countries of Europe are anxious to study the black man in America with a view to improving conditions

in their own African possessions, and to securing from among the people here expert and intelligent cotton growers to go into Africa. Another cause of increased interest on the part of the European public in the American negro within the last few years is, I regret to say, the number of lynchings which have taken place in our country. It may not be generally known, but few people who have traveled in Europe will fail to agree with me when I say that practically every lynching that occurs in any part of America is reported in the European press, and in many cases with an exaggeration that causes an American to shrink with shame for the reputation of his country. The bare facts in connection with these lynchings are bad enough without the exaggeration. It is hard for the Frenchman to understand, to use his own words, why a country that boasts of being "the land of the free and the home of the brave," suffers itself to get a reputation the world wide for law breaking and barbarism. A third cause of interest, strange as it may seem, is the introduction of the American negro cake-walk! A company of colored people made their appearance last winter in a place of amusement on one of the fashionable boulevards, and, it seems, did the cake-walk to perfection. It took Paris by storm. The performance was literally packed day after day with fashionable audiences. It was studied by French dancing masters, and the average Frenchman got the idea that the cake-walk was a new form of dance introduced into the

aristocratic circles of Fifth Avenue, New York, and at Newport, and it is almost impossible to make him understand that cake-walking is not universally popular in America. After giving this new form of dance serious study, the French dancing masters solemnly declared that it could not be introduced successfully in the French ball rooms, but, however this may be, I saw a pretty good imitation of it at a French ball.

Some very intelligent Frenchmen, notably one of the editors of the *Figaro*, have been traveling lately in America. The more this class of people see of America, the more puzzled they are over what is called the Race Problem, and they ask some very interesting questions. For example, this editor of the *Figaro* asked me why it was that in the District of Columbia all races could ride on the same seats in the street cars, but in Alexandria, only six miles away, they had to occupy separate seats. He also asked me why in certain railroad restaurants the negro could stand at the counter and eat, but would be put out if he sat down to eat. For the life of me I could not make him understand that to stand up and eat was not regarded in some sections as a social act, while to sit down was so regarded. Then he asked me why Chinamen or Indians could ride in a first-class car anywhere in America, and negroes could not. He also asked me why negroes could as mechanics build houses in Atlanta, the home of Robert Toombs, and could not erect houses in Boston, the home of Garrison. Then he asked me why white men and black men drank liquors in the same bar room, but could not, in many parts of America, drink the communion wine together in the same church. The average Frenchman is mighty interesting. Color prejudice is especially difficult for him to understand in the face of the fact that one of their greatest literary characters, Alexandre Dumas, whose works can be found in nearly every private and public library in the world, was a colored man.

When I was in Europe three years ago I saw comparatively few colored people. During my last trip I saw many more. Some are from America, others from the West Indies, and still others from Africa. The American negro is beginning to

travel more and more each year. The most numerous class of black people to be found in France are from the Republic of Haiti; some are in diplomatic positions, others are exiles, and still larger numbers are in France for education. One of the most interesting colored men that I met in Europe was a Haitian school teacher, who was traveling with a group of young Haitian students for the purpose of education. While I was in Paris several delegations of Haitian gentlemen called to see me, and I found them highly cultured, very intelligent and patriotic people. Their conversation related almost solely to some method of finding a way to end the frequent revolutions, and to develop the natural resources of their country. At one time there was a strong sentiment against sending youths to America for education, but that feeling is now disappearing. A short time ago the National Congress of Haiti voted money to pay for the education of a number of selected men at Tuskegee Institute, and they, together with others who pay their own way, are making excellent records. The Haitians whom I met in Europe, without exception, expressed the belief that what is needed in Haiti at the present time is the introduction of a system of industrial or technical education, such as is in operation in this country. This they felt necessary, not for the purpose of replacing or excluding the classical training obtained in Europe and at their homes, but to give vitality to education and to connect it with the real needs of the country.

Two truths above others are impressed continually upon a colored man traveling in Europe. First, that the average morality of the negro in any part of America compares most favorably with that of the same grade of people in any section of Europe. My own individual opinion, based upon considerable observation, leads me to make the statement that the moral status of the colored people in every part of the United States is higher than the average moral status of the European peoples. In this connection, several considerations should be constantly kept in mind. One is that the social distinctions, or spirit of caste, prevents the average white man in America from seeing and coming into actual contact

with the best life among the colored people in America; consequently, many may not, for this reason, credit the estimate which I place upon the moral condition of my race. Another consideration not to be overlooked is that, because of his physical, industrial and political connection with the white people of the United States, the American negro is constantly being compared with the white civilization of the United States, which, taken as a whole, represents the very highest degree of civilization now existing. If the geographical location of the American negro were such as to lead one constantly to make comparison between him and the products of Latin civilization as found in Europe or South America, or of oriental civilization as found in China, the negro would be judged less harshly than at present.

Lastly, one who has made even a cursory study of the conditions of the working and middle classes of people in European countries cannot refrain from constantly asking himself, How do the conditions and prospects of these classes compare with those of the negro in America? This is a question much more easily asked than answered. In a brief article like this one cannot be expected to go

into details. So long as the working or middle classes remain on the other side of the water, I would say that the condition and prospects of the American negro are better than those of the classes of Europeans to which I have been referring. When those people emigrate to America, no one acquainted with the facts will question the statement that the newly arrived emigrant is given an opportunity for growth and general development not accorded to the average negro. In fact, one of the questions with which the American traveler is continually beset in Europe, is why the very lowest type of Italians, for example, can go to the State of Louisiana and be given a share in the government which is accorded to few of the best class of negroes, whose ancestors, together with themselves, have resided in this country for more than two centuries.

My general conclusion, after observing conditions in foreign countries more than one, is that with the exercise, on the part of the white men and of black men, of due patience, forbearance, courage and perseverance, the difficulties which often trouble both races in America are not insurmountable.

TUSKEGEE, ALABAMA.

The World Runs On

BY EDMUND VANCE COOKE

So many good people find fault with God,
Tho admitting he's doing the best he can,
But still they consider it somewhat odd
That he doesn't consult them concerning his
plan.
But the sun sinks down and the sun climbs
back,
And the world runs round and round its track.

Or they say God doesn't precisely steer
This world in the way they think is best,
And if he would listen to them, he'd veer
A hair to the sou' sou'west by west.
But the world sails on and it never turns back
And the Mariner makes never a tack.

So many good people, like you and me,
Are deeply concerned for the sins of others
And conceive it their duty that God should be
Apprised of the lack in erring brothers.
And the myriad sun-stars seed the skies
And look at us out of their calm, clear eyes.

CLEVELAND, OHIO.

Or the same folk pray "O, if thou please,
Dear God, be a little more circumspect;
Thou knowest thy worm who is on his knees
Would not willingly charge thee with neglect,
But O, if indeed thou knowest all things,
Why fittest thou not thy worm with wings?

So many good people are quite inclined
To favor God with their best advices,
And consider they're something more than kind
In helping him out of critical crises.
But the world runs on, as it ran before,
And eternally shall run evermore.

Further Progress in American Samoa

BY COMMANDER E. B. UNDERWOOD, U. S. N.

GOVERNOR OF AMERICAN SAMOA

It is taken for granted that the readers of THE INDEPENDENT are familiar with the articles on American Samoa by Captains Tilley and Sebree, United States Navy, both Governors of American Samoa, that have already appeared in that publication; therefore, I shall confine my account mainly to what has taken place in the past year.

Just before my departure from Washington for these islands, an acquaintance—presumably a humorist—furnished me with the following explanation of the derivation of the name of this Samoan or Navigator group: "This group takes its name from one Sam Owen, an English navigator of the buccaneering type, who flourished in the South Seas something over a century ago."

History, myth, tra-

Toomata, a Member of the Native Guard and Son of a High Chief

dition, legend—none of these throw any light on "one Sam Owen."

The name of Navigator was bestowed by the Frenchman, Bougainville (1768), who thought he detected in the natives unusual skill as navigators; the name Samoa is composed of two native words, *sa* (sacred) and *moa* (hen), and there is a myth to the effect that—but this is beside the point.

The work of the Commandant here is generally interesting, but it often contains a good many—not anxieties, but annoyances. I might briefly note, for instance, these cases: The Elopement of a Common Fellow with a Taupou (village maid); The Disturbance Attending the Serving out of Kava (native drink) to Certain Chiefs in an Order not in

Accord with Established Precedence, and The Affair of the Improper Distribution of the Edible Parts of the Pig. These matters may seem trivial, but the natives take them very seriously; in fact, it is sometimes difficult to prevent their making such trifles a *casus belli*. But I find that I am digressing, and must stick to my text, which is progress in the Americanization of Samoa.

The general conduct of the govern-

ment has accepted the cession of Tutuila by the natives, but nothing further has been done. The laws in force at present have no backing, other than the signature of the Commandant. It thus appears that the Commandant not only executes the laws, but that he also makes them. And this is not all. As he is President of the High Court of Tutuila, before which come the most important cases, he has in his hands a large share

of the judicial authority of the islands. It is hoped that Congress, at its next session, will remedy this defect by extending to this part of our domain such of the laws of the United States as are applicable to it, and by providing it with a Chief Justice (particularly needful in land cases).

We are behind Germany in this matter, for her share in the partition of Samoa has been made into a German colony, with a Governor, a Chief Justice and other officers, all with defined powers.

One of the greatest obstacles the Commandant has to contend with is the lack of a good interpreter. Such an official is hard to find, and should

ment has gone on in the main satisfactorily—after the fashion indicated by Captain Sebree in his article. At the same time, it is most desirable that Congress should definitely fix the status of these islands and determine the form of government to be followed. The laws of the United States have not yet been extended to our possessions here by either Congress or other competent authority at home, and the ordinances that have been established by the successive Commandants have received neither the approval nor the disapproval of the Navy Department. It is true that the Presi-

dent properly be paid out of the revenues of the island rather than by the general Government. Perhaps the island funds will eventually be able to afford a first-class man, but such is not the case at present. The Secretary of Native Affairs has an excellent knowledge of the Samoan language, but he is ordinarily so busy in other directions that dependence has to be placed on a much inferior interpreter.

In order to show his attainments, I will quote a few of his interpretations made in a recent land case:

"Did you heard me made that remark?"

"Did you intending to take up your resonance (residence) at that place?"

"Did you know I didn't went there with a spear and kill your pig?"

(Do you not know that I went there with a spear and killed your pig?)

"Which is best to get to the Kingdom of God — the Old Testimony or the New Testimony?"

(Which is the best guide to Heaven — the Old Testament or the New Testament?)

"During the time of your life you have enough sense to have a long memory, do you remember anything to happen?"

(Since you have been able to remember, what important events have happened?)

This last was intended as a test of memory.

I have digressed so much that per-

Native Woman in Front of Samoan House

haps my readers will tolerate a few more quotations from this land case. One native put this question to a witness: "Did your grandfather get this land by blood (inheritance) or by the strong hand (conquest)?" Another, in answer to the question "How long has this land been in possession of your family?" replied, "Since the time of the darkness, when the devil was in the island among the people." By this he meant, since be-

fore the advent of the missionaries (1833). Another, when asked what time a certain event had taken place, replied that he did not know; he had looked at his clock, but it was "dead" (run down).

As far as the Naval Station proper goes, during the past year there have been acquired from the owners 22.06 acres of land, making a total of 37.88

Iron-Bound Coast Between Nunull and Leone

acres comprised in the station. In addition to a considerable amount of filling it, grading and reclaiming, there have been built a commodious house for the Commandant, three boat houses, a cottage for enlisted men serving ashore, an ice house for the proper preservation of fresh provisions, a surgeon's office and operating room, a small storehouse, a lazaret on Goat Island in the harbor, and a house for the temporary storage of copra during the copra season. The last two mentioned were paid for out of the revenues of the island. It has never yet been necessary to use the lazaret as a pest house, but it has proved useful to the men of the station ship "Wheeling," obstinate cases of prickly heat quickly yielding to the breezes which prevail on Goat Island to a larger extent than in the inner harbor. We are now preparing for the installation of an ice making machine and for the erection of a suitable office building, one of the larger rooms of which will probably be used for the Court to sit in.

—certainly at this time—of little value strategically. As it is considerably south of what is at present our line of expansion in the Pacific, it is not likely that the Government will feel inclined to spend a great sum in fortifying it.

The *fitafitas* (or native guard) are young men of the best families of the islands, enlisted by the Navy Department. They number fifty-eight, and take the place of marines. They are a well-drilled body of men and are extremely useful for boat work and for handling heavy loads of stores on steamer days. In reliability and discipline, however, they are not yet up to the standard of white soldiers. Perhaps this is not to be wondered at when we reflect that the wild blood of scores of generations is coursing through their veins. The Navy Department has recently allowed for the station a band of sixteen pieces, to include two white musicians (as instructors) and fourteen natives. This band is now organizing and when properly trained will doubtless be most popular with the

New House of Commandant

The question of fortifying the harbor of Pago Pago must be settled by the wise men in Washington. This harbor, while of the highest importance tactically, is

Samoans, who are unusually fond of music.

Passing now from the limited subject of the Naval Station proper to the

broader one of our Samoan possessions in general, it may be said that, altho conditions are still far from ideal, there has been a gradual improvement. The native officials are better acquainted with their duties, and attend to them more carefully, but it is not to be understood that they have by any means attained perfection. The rank and file of the people, too, have improved in some respects. I might instance a native church recently completed in Fagatogo, which has

Certain of the customs of the people are detrimental, but hard to break up. I might cite that of community of goods and money. What a man earns he does

Native Church, Village of Fagatogo

Custom House, Naval Station, Tutuila

provided benches for its worshipers, being the first in the islands to do this. Hitherto, the custom has been for each person resorting to church to carry with him a straw mat, on which to sit on the floor during the service. The *fitafitas*, after having for three years eaten their meals, after the Samoan fashion, sitting on the floor of the barracks, have recently asked to be supplied with mess tables and benches, similar to those in use on board the station ship "Wheeling." I notice that many Samoans, when in the open air and in sight of the flag, stand at attention and salute at morning and evening colors, thereby following the example of the officers and men of the navy stationed here. There are a number of other small ways in which it is evident that contact with the whites is having its effect on the natives.

not enjoy, but has to turn over to the head of the family, to be used for the common benefit of the members thereof. In May last, a number of the young men of the village of Fagatogo, adjoining the Naval Station, engaged in a free fight, amounting to an incipient riot, with a number of the *fitafitas*. The local court handled the case, and nine of the ringleaders—four of the Fagatogo young men and five *fitafitas*—were sentenced. The punishment inflicted included fines to the aggregate of \$420 for the Fagatogo young men and \$162.50 for the *fitafitas*. The fines of the former were paid by the entire village of Fagatogo and of the latter by equal contributions from all the members of the *fitafitas* organization. Here is a case in which the court did its duty by assigning an adequate sentence, and yet the culprits received no punishment to speak of.

I think the natives, on the whole, grow more and more to trust the Government. They recognize that it has no desire to overreach them, and, altho in a few directions they are not altogether satisfied, they realize that the good derived

Preparation of Kava (Native Drink)

much more than counterbalances what they consider the evil. One of the chief causes of dissatisfaction is the settlement of cases involving the ownership of land. That this is a vexatious subject will be conceded when it is pointed out that there are no deeds nor records to refer to; that genealogies are to be had by word of mouth only, and that in most cases the land has not even been surveyed. The settlement of these cases is always attended by more or less discontent and misgiving. The presence of a regularly appointed Chief Justice would, I am sure, go far toward a more satisfactory settlement of these troublesome cases.

The making of roads, while not entirely stopped, progresses slowly. When Samoans travel, they march in single file, and they think that a trail is all that is needful. As the United States Government does not pay for labor on roads (except in the Naval Station proper), and as the natives are naturally lazy, per-

haps it is not to be wondered at that the work has dragged. A practical bridge-builder and engineer has recently been obtained from the United States, his pay coming out of the island funds, and road building is again being pushed. The customs fund of the islands has been carefully husbanded for several months, and there is now nothing to prevent this work from going forward for some time to come. It is hoped eventually to blast out the passages through the reef at all important villages, so that the entry and departure of boats shall be perfectly safe.

The native taxes for the present year have—as heretofore—been assessed in copra. An unusually severe hurricane in February last did considerable damage to the cocoanut crop, and probably the 800,000 pounds assessed for this year is all the natives ought to stand. It is gratifying to report that the highest bidder this year is a San Francisco firm, the price offered being 2.6 cents a pound.

Arrangements have been made to sell the copra in excess of that required for taxes to the same firm at the same price. It is problematical how the copra question is coming out this season. As already noted, the cocoanut crop is short, from the effects of a hurricane, and, in addition, for weeks past there has hardly been a day without rain. In consequence it has been extremely difficult to cure the copra, and the local agent of the San Francisco firm has been compelled to reject some that has been presented, because it had got wet and rotted.

Within the past year the taxes on imports have been increased from 2 per cent. to 10 per cent., ad valorem. This puts the island funds in a much more flourishing condition, and provides means for the work on roads and passages through reefs already referred to.

In May last a census of our possessions was taken, the result showing the entire population of American Samoa,

exclusive of officers and men of the navy, to be 6,046, of which number 5,888 were Samoans and 158 of other nationalities. Even had there been sufficient funds to pay white enumerators, such are not to be found here, and, consequently, the work had to be done by native officials. Altho the information desired was carefully explained, these, from inexperience and lack of knowledge, made a mess of their returns, so that, aside from the number of residents, little of value was obtained.

Public schools, in which the teaching of English shall be the main feature, are among the greatest needs of the islands. I meet few Samoans that have any adequate knowledge of our language, and it is hoped that the next Congress will provide us with two or three schoolmasters.

The hurricane of last February, in addition to the damage done to the coconut crop, also materially injured the breadfruit and banana crops.

As these are the main dependence of Samoans in the matter of food, for the past few months there has been a great complaint about the "famine." The remark that I have lately seen, attributed to a missionary in Africa, ordinarily applies equally well here: "The people are clothed by the sunshine and fed by gravitation." A few towns have been short of food, and others have suffered some inconvenience, but no hollow cheeks, no gaunt frames, no protruding ribs have been visible. The Samoans know not the real meaning of the word *famine*, and, as nature has been so kind to them, they probably never will know it. During the stringency, about 1,200 pounds of hard bread and 28,000 pounds of rice were imported by the island Government, paid for out of the customs fund, and then sold at cost to the most needy natives. The last of July the new crops began to mature, and nothing further is heard of "famine" and "starvation."

The Samoan is not to be depended upon in the matter of work, and few natives are employed by the Government, national or island. Most of the laborers come from the British South Sea islands, such as Niue and Raratonga. The principal lack here, however, is skilled laborers. In all our possessions there are only two or three competent carpenters, one competent blacksmith and one competent plumber. In consequence, only one job of any magnitude can be undertaken at a time. This is very unfortunate, as there are many public works delayed by this lack. We already have on the waiting list an office building, officers' quarters, building for ice-making plant, carpenter and blacksmith shops, lighthouse on Island of Aunuu, observatory, extension of water works and extension of telephone system. With the present facilities, it will take months to complete this work.

The horizon of the Samoan is re-

Mountain Known as the Rain Maker, with Goat Island and the Lazaret in the Foreground

Washing Day at Pago Pago

stricted, his environment limited; therefore, it was thought best to undertake the publication of a monthly newspaper, to be paid for out of the island funds. It is printed in the Samoan language and it has been given the name that is equivalent to our "adviser" or "instructor." The first number appeared in August. It is a paper of four pages, one page being devoted to local news, the publication of ordinances, regulations, etc.; a second to correspondence from natives, and the remaining two pages to information about the outside world, particularly about our own country, which the native regards also as his. A number of copies are distributed free of charge among the native residents of the islands. As about three-quarters of the population can read what is printed in their own language, it is hoped that by means of this paper the views of the people generally will be enlarged and that they will be given something profitable to talk about, to the exclusion of the gossip and scandal that now prevail. Should this newspaper experiment prove of benefit to the natives, it may be possible in the future to pub-

lish it once every two weeks. So far this paper has been received with great favor by the natives.

The discontent and friction that were evident in Manua last year have all disappeared, and the Manuans seem quite as well satisfied with the Government as are the Tutuilans. Altho the latter have ceded their islands to the United States, the former have never done so. It has been thought best not to bring pressure to bear on them, as such pressure might easily result in defeating the end sought. In the course of time, the Manuans will very likely take the initiative in this matter themselves.

One thing that would be apt to strike a stranger coming to these islands is the fact that there are so many really good churches. Not many villages of any size are to be found but what have their churches, and those that are lacking are looking forward to building. The trouble is that the villages try to vie with one another, and in consequence build churches that are too fine and too large for the population. The village of Fagatogo has recently finished a church,

the materials of which cost \$3,700, the labor being furnished by the inhabitants. The village of Nuuuli, with a population of perhaps 250, has just contracted for \$4,700 worth of material for their church and \$1,200 for the carpenter who is to build it, most of the labor to be furnished by the residents. The people of Nuuuli have been saving for the past eight or nine years in order to build this church.

The natives may all be considered Christians, tho doubtless more of them are superficial rather than real Christians than is the case at home.

Approximately, the following of each of the four denominations represented in the islands is:

London Mission (Congregational).....	5,000
Roman Catholic.....	600
Latter Day Saints (Mormon).....	200
Wesleyans	50

Sunday is really a day of rest, the people generally doing no work and remaining quietly in the villages, and the churches holding their services, sometimes as many as three a day.

A number of the leading natives have submitted petitions asking that they be sent to the Louisiana Purchase Exposition in St. Louis next year. Obviously, the revenues of the islands are too small to stand the expense involved and it has been explained to the petitioners that there is great doubt whether an appropriation for such purpose will be available at home. If a small party of Samoans could be sent to the Exposition the effect would undoubtedly be good in an educational way, and, further, if such party could have an audience with the President, either in St. Louis or in Washington, the effect would be most excellent. Samoan houses are light, compact and portable, and a small one of these might make an attractive addition to the

Exposition. As the climate of Samoa is very different from our own, such a party as has been indicated ought not to reach St. Louis before June 1st, nor remain there after September 1st.

The surgeon of the station ship "Wheeling" has done good work in his treatment of the wounds and diseases from which the natives suffer. If it were not for his skill they would be badly off, as he is the only regular practitioner in our possessions. Unfortunately, the Samoans often trust their sick to native doctors and take them to the surgeon only after these have failed to effect a cure. Again, when the skill of the surgeon does not seem to work quickly enough, the friends of the patient are apt to remove him from the surgeon's care, frequently with fatal results. The "Wheeling's" surgeon and the white missionaries have vaccinated about 50 per cent. of the natives of Tutuila, and it is purposed, as a matter of protection, to vaccinate the remainder, as well as those of Manua, as soon as practicable.

The Samoan does not lack in intelligence; this is shown by his quick grasp of financial matters. He is lazy and, as a rule, not ambitious. I think, however, that he can be educated to a plane considerably higher than that on which he now stands. To be lasting, his improvement should be gradual, his development progressive. The march forward should be steady but slow.

Large reforms are not effected in a day; evolution is not the work of a year, nor even of a decade. Therefore, I think that if each of the white men successively in charge here so bears his burden as to leave conditions a little better on his departure than they were on his arrival, the result will be just what is desirable and all that the receptibility of the native can stand.

PAGO PAGO, SAMOA.

Books of the Year

Fiction

- Questionable Shapes.* By W. D. Howells. Harper. \$1.25.
Letters Home. By W. D. Howells. Harper. \$1.50.
The Better Sort. By Henry James. Scribner. \$1.50.
Lady Rose's Daughter. By Mrs. Ward. Harper. \$1.50.
Felix. By Hichen. Stokes. \$1.50.
The Untilled Field. By George Moore. Lippincott. \$1.50.
His Daughter First. By A. S. Hardy. Houghton. \$1.50.
The Column. By Charles Marriott. Lane. \$1.50.
Love with Honor. By Charles Marriott. Lane. \$1.50.
The Main Chance. By Meredith Nicholson. Bobbs-Merrill. \$1.50.
The Pit. By Frank Norris. Doubleday. \$1.50.
Truth. By Emile Zola. Lane. \$1.50.
The Ward of King Canute. By Ottilie Liljencrantz. McClurg. \$1.50.
The Castle of Twilight. By M. H. Potter. McClurg. \$1.50.
Maids of Paradise. By Robert Chambers. Harper. \$1.50.
Lovey Mary. By Mrs. Rice. Century. \$1.00.
Pa Gladden. By E. C. Waltz. Century. \$1.50.
The Little Shepherd of Kingdom Come. By John Fox, Jr. Scribners. \$1.50.

Earth's Enigmas. By C. G. D. Roberts. Page. \$1.50.
Memoirs of a Child. By A. S. Winston. Longmans. \$1.00.
The Call of the Wild. By Jack London. Macmillan. \$1.50.

THERE is always a group of veteran authors who can be depended upon to furnish at least one novel a year, and it is Mr. Kipling's eccentricity that he does not appear among them. But we have no sooner recovered from the psychic agitation of reading *Questionable Shapes* before Mr. Howells favors us with another volume, *Letters Home*. And this time the humor of the situation consists in his effort to metaphorphose himself into the different characters who write

letters home from New York. When we recall Mr. Howells's long literary insistence upon the commonplace, nothing can be more diverting than the mimicry with which he counterfeits the extravagant emotions of a susceptible young man. And, if anything, his genius for confounding us with the incredibilities he discovers in ordinary existence is on the increase. Meanwhile, Mr. James's volume of short stories, *The Better Sort*, plainly indicates that he has reached the period of literary dotage where the distinguishing qualities of his style, the oddity of his method, have become almost meaningless idiosyncrasies. As usual, the interest of Mrs. Ward's late novel, *Lady Rose's Daughter*, depends upon her ability to interpret the inner struggles of people who are conscious of their souls. *Felix* is another story, which proves that Mr. Hichen has a genius for diving deep into our undercurrents and stirring up the evil sediments of human nature. *The Untilled Field* marks Mr. George Moore's return to the support of Irish sentiment in art and in the national life. But as usual the real interest in the story depends upon sex and religious instincts. We learn from him that one is founded upon the other, and in its last analysis religion is simply the romantic fervor of sex nerves which takes hold of the higher faculties. After the lapse of seventeen years Mr. A. S. Hardy gives a sequel to "The Wind of Destiny" in the novel, *His Daughter First*. His aim was to tell a story and to tell it with artistic restraint, and in this he has quite succeeded. Young Charles Marriott is not yet in the veteran class of novelists, but his two stories, *The Column* and *Love With Honor*, are of such merit as to win for him a place among them. He is a student of Meredith in the sense that Besant was a student of Dickens; and the influence of the master has by no means overwhelmed the genius of his disciple. And while we think of it we must not forget that new American author, Nicholson, who has given a remarkable study of Western social conditions

in *The Main Chance*. He is the only writer among us who can equal Mr. William Dean Howells in his interpretation of a thoroughbred man. *The Pit* was the second volume of Frank Norris' trilogy, which he called "The Epic of the Wheat." In some ways it was a stronger book than "The Octopus," and showed the increase of the author's power, as well as his weakness as a literary artist. He was the one man of note in America seriously affected by Zola's influence without suffering the taint of his bestial genius. And it is a coincidence that they both should have passed away during the same year. Zola's last novel, *Truth*, was based upon the Dreyfus affair. And in this story he appears to have reached the final decadence of his creative faculty. Beginning with the hypothesis that man is the product of heredity and environment, he multiplied the individual, and became the interpreter of the animalized life of the resultant leprous mass. He had a genius for obscenity. But he suffered the natural revulsion of age and experience from this degradation of his imagination, and in this last story turns dully to the contemplation of abstract ideas. With the passing of Zola the literary art of our times

JOHN FOX, JR.

ALICE HEGAN RICE

is delivered from the further influence of a gifted but degenerate mind.

One feature of the year's fiction is the decrease in the number of historical novels and a corresponding improvement in literary merit and historical reality. For this relief we hope we are duly grateful. Chronologically, *The Ward of King Canute*, a story of the Danish invasion during the tenth century, comes first. And the memory of this book that lingers longest is of the rude splendor of life in an age when a king might hold his court in the forest and have all the pageantry of nature added to the barbaric extravagance of the situation. Miss Potter casts her literary net several centuries later into history, and *The Castle of Twilight* is a remarkable revelation of the forlorn condition of medieval women. Mr. Chambers's new novel, *Maids of Paradise*, is a story of France during the Franco-Prussian War; and it is not only a masterpiece of battle imagery, as if the author had some of Zola's frenzy in dealing with the red riot and fury of a tremendous situation, but it is in every particular an excellent work of art, showing the skillful liter-

ary craftsman and a splendid creative faculty.

Kentucky leads the list in Southern fiction, with five novels of unusual merit. *Lovey Mary* is nearly related to the immortal "Mrs. Wiggs" in sympathy and homely charms. And the *Pa Gladden* stories are tender studies of scriptural country life. *The Little Shepherd of Kingdom Come* is the most delightful young knight errant who has stepped upon the stage since "Sentimental Tommy" left it. *Round Anvil Rock* is a story of 1811 when the land was a wilderness, every man a hero and every maid a match for him. Meanwhile *The Mettle of the Pasture* is one of the notable books of the year. Mr. Allen will probably never surpass it in art or purpose. There is the dignity of a broad patriotism in the latter, and the old charm in the former familiar to all his readers. But for the most part Southern fiction is historical in setting and provincial in spirit. *Gordon Keith* is a story of Reconstruction days in Virginia, *Gabriel Tolliver* in Georgia, and *A Gentleman of the South* in Alabama. Apparently the literary genius of the South has determined to camp in this red region indefinitely. And it is a curious reflection upon the modern life of that section, as if there was nothing in it worthy of note or appreciation.

Several books bearing upon different phases of social life in New York have appeared. Among them *The Silver Poppy* gives the impression that the literary Bohemia there is a treacherous circle where innocent young geniuses may be fleeced of their virgin wares by some pretty, impoverished lady of the pen.

The sex element is one of the properties of fiction always, but it reaches the point of mania in *The One Woman*; and in a less offensive way it destroys the poise of every character in *The Mannerings*. But, altho it is carried even further by the author of *The Sherrods*, the effect is not so offensive. And it is certainly less diseasing to the reader's mind even if the story is frankly immoral.

A number of books come out every year, so unique that they cannot be classified under the ordinary heads of fiction, such as *Darrel of the Blessed Isles*, a volume which contains the spiritual es-

sence of woods and fields distilled into human hearts; or *From a Thatched Cottage*, that beautiful pastoral of English peasant life. And there is *Putnam Place*—the sorrows and joys of simple village folk told in a leisurely, refined style, so dear to the gentle reader. *The Road Mender* is a dainty volume of modest mien yet with the genuine flavor of culture in its pages. And nothing more delicate or of a finer polish and purer form has been fashioned by our fiction

ROBERT HICHENS

makers of late than *A Turquoise Cup and the Desert*.

Among the nature books *Earth's Enigmas* has running through it a subtle questioning of the cruel, predatory side of nature. And Mr. Jack London's *The Call of the Wild* is a notable achievement. He gives a character of almost human interest to his dog-hero, without marring the tale with mawkish sentimentality. It may seem a strained classification, but we cannot refrain from adding to this list *Memoirs of a Child*. Nothing more sympathetic or truthful was ever written of the mind and heart of a child.

Religion and Philosophy

- Agnosticism.* By Robert Flint. Scribners. \$2.00 net.
Religion as a Credible Doctrine. By W. H. Mallock. Macmillan. \$3.00 net.
The Essence of Christianity. By W. A. Brown. Scribners. \$1.50 net.

Why the Mind Has a Body. By C. A. Strong. Macmillan. \$2.50 net.

THE first place among the religious books of the year must be given to Flint's *Agnosticism*. It is a thoroughgoing defense of rationalism, the doctrine that "religious belief ought to be the rational belief of the whole man. Evidence should be the measure of assent, and assent should be in proportion to evidence." The idea that the objects of faith cannot be proved and are not matters for scientific testing, but rather the convictions of faith based on the revelation of God, is emphatically repelled. Professor Flint will have every man convinced of the realities of faith through his reason, and his attack on the followers of Ritschl, who found faith on personal experience, and on Prof. William James, who teaches that belief is an act of will, is as merciless as it is brilliant. His criticism must be reckoned with in future consideration of the basis of religious conviction.

Mr. Mallock exhibits a somewhat unusual variety of the Agnosticism which so stirs the soul of Professor Flint. He declares that free-will and immortality are conditions of religion, and then pronounces worthless all arguments by which it has been sought to prove them. Science has no escape from absolute determinism, no room for the "theistic God." Yet Mr. Mallock believes, declaring that all knowledge ends in contradictions, and a belief in contradictions is not unreasonable. Having thus cleared the way for acceptance of what the reason declares incredible, he recommends faith on practical grounds, for the advantages

which experience has shown result from it.

The Essence of Christianity is an excellent history of the more important attempts to define Christianity. It is written in the belief that the effort to determine the essential message of the Christian religion must be based on sympathetic appreciation of former endeavors to separate the kernel from the husk, and to present that which is vital and distinctive in the Christian faith. The chief interest in theology has passed from questions of literary criticism to the problem of the essential character of Christianity itself, and in this supreme task Professor Brown has rendered good help.

Mr. Illingworth is a distinguished representative of the "Lux Mundi School," and his *Reason and Revelation* is an able exposition of the doctrine of the Incarnation, which contains for him the whole essence of the gospel, and is that which gives the gospel its authority and power. The truth of the Incarnation is defended at length by appeal to Philosophy, to the historic facts of the Scriptures, and to the "Living Church."

One of the ablest teachers of Dogmatic Theology is Prof. Paul Lobstein, of Strassburg. His *Introduction to Protestant Dogmatics*, translated by Arthur Maxson Smith, deals with such fundamental questions as the true nature and function of doctrine in Christianity and the ideal and method of Protestant theology.

Two important biographies not only describe interestingly the personalities of two men of strong influence in the English speaking world, but also contribute considerably to the history of recent Christian Dogmatics and Ethics, and New Testament Criticism and Introduction. One of these biographies is that of Brooke Foss Westcott, principal editor of the Greek Text of the New Testament, which is still the standard, New Testament reviser, influential preacher, and a successful Bishop of Durham; the other is that of James Martineau, the distinguished teacher of Ethics and the kindly preacher of the authority of the Spirit.

Professor McFadyen, of Knox College, Toronto, has endeavored to allay the

troubles caused by the Higher Criticism of the Old Testament and to show that the religious value of the book remains undisturbed. He presents accurately and fairly the results of modern investigations, defends critical methods without compromise, but with real tact, and handles his subject impartially and persuasively.

It is entirely gratuitous to say that Professor Sayce's Gifford Lectures on *The Religions of Ancient Egypt and Babylon* are the work of a competent scholar and a stalwart defender of the faith. He portrays the lines on which religious thought moved in those great peoples of the far-away times, and only on minor points will issue be taken with his conclusions. The value and reputation of the excellent Semitic Series has been enhanced by Professor MacDonald's *Development of Muslim Theology, Jurisprudence and Constitutional Theory*. A new and enlarged vision of the great Reformation struggle is obtained from the *Rise and Fall of the Anabaptists*, by E. Belford Bax. These sixteenth century anarchists were apparently the *reductio ad absurdum* of the new light and faith, and the story of their vagaries and their suppression by the Protestant leaders is suggestive and instructive.

Volume IV of the *Encyclopedia Biblica* completes the most radical, and in some respects most arbitrary, Bible Dictionary ever issued, but one which is at the same time the most brilliant, the most daring and suggestive in historical reconstruction, and the most invigorating and stimulating to study and further research. It is not a reference work for one who wants easy information of safe and accepted results, but it is indispensable to every worker in real Biblical science.

The work of Janet and Séailles, now translated, is a history of Philosophy in new form; not a history of philosophers and their systems in chronological order, but a history of philosophical problems, traced through the various systems. It is intended as an introduction to the problems of psychology, ethics, metaphysics and theodicy. It compacts in brief compass the results of a vast deal of careful and critical reading, and is of value as a labor saver and from its full-

ness in important French sources often overlooked.

The pathos of a probably last disclosure to the public attaches to Henry Maudsley's *Life in Mind and Conduct*, and the sadness is unrelieved by the tone and spirit of the testament. It is a kind of empiricist ethics, the wisdom of life of a modern Ecclesiastes, a harmonization upon the theme of vanity, irony, nothingness. Yet it is the work of a trained and able mind, written boldly in a clear and steady style, with a wealth of material and many decidedly original propositions of no inconsiderable value.

Professor Royce's *Outlines of Psychology* is a volume in the Teachers' Professional Library. It is modest in pretention, but sets forth the principles of psychology in a manner at once comprehensive and original. It contains an able discussion of the application of psychological theory to questions of education.

The posthumous work of Professor Sidgwick is a somewhat detailed criticism of the ethical writings of Green, Spencer and Martineau. The treatment of Green is somewhat inadequate; that of Herbert Spencer is more successful, while to Martineau's ethical theory not much importance is attached.

The title of Professor Strong's volume, *Why the Mind Has a Body*, suggests the fundamental nature of the questions there discussed. The problem of interactionism and automatism is attacked and the author maintains that Hume did not disprove the existence of a "rational connection" between cause and effect. The book is a brilliant piece of argumentation.

Criticism

- A History of Criticism and Literary Taste in Europe.* By George Saintsbury. Vol. II. Dodd. \$3.50 net.

- Charlotte Brontë, George Eliot, Jane Austen.* By H. H. Bonnell. Longmans. \$2.00 net.

Robert Browning. By G. K. Chesterton. Macmillan. 75 cents net.
Tennyson. By Sir Alfred Lyall.

IN criticism and literary history the year has been rather richer than usual. There is first of all the second volume of Professor Saintsbury's great *History of Criticism and Literary Taste in Europe*, which brings down his studies to the modern period of the nineteenth century. Professor Saintsbury's work is of the sort that challenges disapproval in many respects; nevertheless, it will probably for many years remain the most comprehensive and interesting survey of the whole field of critical literature. More historical and biographical is the pictorial *History of English Literature*, in four volumes, two volumes of which have already appeared, the first, by Richard Garnett, dealing with the early period down to Queen Elizabeth, and the third, by Edmund Gosse, going through the ages of Milton and Dryden and Johnson. To those desiring a thoroughly penetrative and authoritative work these volumes are somewhat disappointing, but they are entertaining, and their wealth of illustration gives them a particular value. On a much smaller scale is Professor Trent's *History of American Literature*, the best manual of the subject that has yet appeared.

In essays we have Mr. Burroughs's *Literary Values*, written in his suavest and most charming vein, and taking up more especially the influence of democracy on letters and kindred topics. Mr. Perry's *Study of Fiction* is particularly directed to those who wish to study the art and process of fiction from a somewhat academic point of view, and has won high praise in this country and in England. *Essays on Great Writers*, by Mr. Sedgwick, is more purely literary in tone, and reminds one of Lowell in such papers as that on Izaak Walton.

More particular studies are *Tolstoi as Man and Artist*, a glowing picture of the Russian novelist and prophetic by a brother novelist, and Mr. Bonnell's three associated monographs on *Charlotte Brontë*, *George Eliot*, and *Jane Austen*. Half critical and half biographical, as in the other volumes of the "English Men of Letters" Series, are Mr. Chesterton's *Robert Browning*, an extremely clever and paradoxical book, and Sir Alfred

Lyall's *Tennyson*, perhaps, on the whole, the safest and soundest estimate of the poet-laureate that has yet been written.

Poetry

- The Five Nations.* By Rudyard Kipling. Doubleday. \$1.40 net.
Pipes of Pan. No. II. By Bliss Carman. Page. \$1.00
The Book of the Rose. By C. G. D. Roberts. Page. \$1.00 net.
Message and Melody. By Richard Burton. Lothrop. \$1.00 net.
Hephaestus. By Arthur Stringer. Methodist Publishing House.
Euripides. By G. MURRAY. Longmans. \$2.00.
Byron. Vol. VI. Ed. by E. H. Coleridge. Scribner. \$2.00 net.
Freneau. Vol. I. Ed. by F. L. Pattee. Princeton. \$3.00 net.
English Comedies. Vol. I. Ed. by C. M. Gayley. Macmillan. \$1.50.

EASILY the most important book of verse that has appeared during the past twelve months is Mr. Kipling's volume entitled *The Five Nations*. One's opinion of this work is likely to be divided according as he admires the poet's imperial patriotism or dislikes his jingoism. One poem, at least, the volume contains

Rudyard Kipling's Latest Photograph

ARTHUR STRINGER

which no one can cavil at—that is, the now famous “Recessional.” Some of the other poems show all Mr. Kipling’s rhythmic power and vividness of writing, but it is a regrettable fact that much the larger part of the book reads like a somewhat weakened echo of the poems in “The Seven Seas.”

Very different in tone is the work of Bliss Carman, that comes to us in the second number of his *Pipes of Pan*. The verse has the usual fluency and mystic sub-tones to which we have become accustomed in Mr. Carman’s work, and, as is usual with such qualities, is somewhat lacking in clearness and firmness. Not entirely unlike Mr. Carman’s work is *The Book of the Rose*, by a brother poet whose birthplace lies beyond the Canadian border. Mr. Burton also has published another volume which he calls *Message and Melody*, and which possesses a quiet interest, as we expect in Mr. Burton’s verse.

A writer who has recently made for himself a name in the magazines now comes out with both a volume of verse and a novel. Mr. Stringer’s *Hephaestus* contains three poems on classical subjects, written with exquisite grace and

refinement, but lacking, perhaps, just the last note of virile originality to be memorable poetry.

Among the translations of the year should be mentioned Murray’s version of three of Euripides’s tragedies, which he has rendered in heroic verse with admirable effect.

The year has given us several notable reprints; first of all, the sixth volume of Byron’s poetry, containing a number of stanzas hitherto unpublished at the end of “Don Juan.” The first volume also has appeared of an elaborate edition of Freneau, the poet of the American Revolution. Freneau can never be really popular again, but his satires and lyrics are well worth reading by those whose taste passes beyond mere popularity. Professor Gayley has brought out the first of a series of volumes planned to contain representative English comedies in historical sequence. The editors who have labored with him have made of the work an example of accurate scholarship.

The Souls of Black Folk. By W. E. Burghardt Du Bois. McClurg. \$1.20 net.

THE year's output on political and social subjects has been large, and its character, as a whole, excellent, tho, aside from the works of Prince Kropotkin, Professor Ward and Dr. Stuckenberg and M. Ostrogorski, there has been nothing of exceptional importance.

International Politics is well represented by Hon. John W. Foster's dignified and convincing account of American influences, political and commercial, in the Orient. The tribute which he pays to American methods in the East is the result of a careful study of conditions at first hand. Mr. Snow's work is interesting, but rather unsatisfactory, since it begins with a theory which is at best doubtful. Mr. Dos Passos gives us a luminous statement of the reasons why a closer union of the Anglo-Saxon communities is desirable, and of the tendencies now at work making for that end. Mr. Balch contributes a clear view of the important interests that were at stake in the recent Alaska boundary question and of the arguments in favor of the American contention. The sentiment which animates the German people against America and England is well treated, tho from a partisan standpoint, by the English publicist who signs himself "*Vigilans sed Æquus*." The contrast between the amenities of German diplomacy and the animosities of the German public is strikingly shown.

Political Science finds its best representation in Ostrogorski's *Democracy and the Organization of Political Parties*. The author, drawing his data mostly from England and America, contends that political machines are inevitable in a democracy. Tho pessimistic, it is a highly stimulating and instructive work.

Political History has four numbers. Professor Merriam gives an interesting and valuable sketch of political theories in America as they have found expression in party platforms and popular movements from colonial to present

days. Professor Woodburn's account is a good summary of political history, tho defective in its failure to reveal the underlying causes of many of the phenomena of which he treats. Hon. W. P. Reeves's account of *State Experiments in Australia and New Zealand* is something more than history, since it discusses economically the matter in hand. No more thorough and instructive work on the subject has appeared. Mr. Hillquit furnishes what has long been needed—a connected account of the Socialist movement in this country from the times of the sectarian communities to the present. It is not well written, tho it covers the ground with care and a commendable degree of thoroughness.

Many of the year's contributions come under the head of Economics. Economic theory has its most conspicuous number in Professor Seligman's work on *The Economic Interpretation of History*. It would be difficult to overpraise this book, so brilliant and convincing is its handling of a doctrine which is so widely misunderstood. Under General Economics comes Professor Ely's recent work. It is excellently adapted for the general reader, and will inform him of what is best and latest in economic study. Here, too, for want of a better place, is to be mentioned Mr. Brooks's book on *The Social Unrest*. The patient investigation of social problems, which the author has pursued for many years, his deep interest in the welfare of both workman and employer, and the clearness and simplicity with which he sets forth his conclusions make this book exceptionally interesting.

Of special studies in Economics there are nearly a dozen deserving mention. Three of these have to do with American railways. Professor Meyer gives a scholarly analysis of railway charters and laws, with a history of railway legislation. Dr. Johnson's and Mr. Pratt's books are somewhat similar to each other, supplying something of history and much of description regarding railway extension and the management of transportation. Taxation is the subject matter of an excellent treatise by Mr. Judson. The restriction on the power of taxation caused by the provisions of the Federal Constitution and the limitations necessarily growing out of our

peculiar form of government are carefully analyzed. Professor Laughlin, in his *Principles of Money*, attacks the quantitative theory vigorously. He displays a wide study of monetary science, tho his involved style often leaves his meaning a matter for guess work. *The Economics of Forestry* is a very commendable reference book of the data regarding our great forests, and furnishes irrefutable proof of the need of stopping the present wasteful destruction. Mr. Montague writes a skillful but hardly convincing plea for the Standard Oil Company, which needs to be revised in the light of Miss Tarbell's history, now running in *McClure's Magazine*. The thousand details of the machinery of business in Wall Street are the subject of an interesting study by Mr. S. S. Pratt. The well-known labor leader, Mr. John Mitchell, publishes a very readable work on *Organized Labor*, which discusses many phases of the industrial problem and embodies the results of his years of experience as a workman and labor agitator. Lastly, Mr. Jack London, who has achieved fame by his Klondike stories, his *Kempton-Wace Letters* and his *Call of the Wild*, contributes a most important study of the life of the London slums. Others, Mr. Charles Booth for instance, have done such work more systematically and comprehensively, but it is doubtful if any have done it more graphically and sympathetically.

Penology has one number—the record of a member of London society sentenced in 1898 to five years of penal servitude for fraud. It is a plain, frank statement, which gives an admirable account of prison economics and administration.

General Sociology has two exceptionally important contributions in the works of Prof. Lester Ward and Dr. J. H. W. Stuckenberg. Sociology is yet in an embryotic state, and needs a vast deal of development to bring it to the rank of a science. These two works, differing in very many respects, are worthy of high praise for their scholarship and sincerity and for the ability with which they analyze and classify social data. They will aid greatly in the work of placing sociology among the sciences. Prince Kropotkin writes a skillful argument in support of his theory that mutual aid has

been a strong factor in natural selection among the lower animals, as well as in what might be called social selection among men, and that "in its wide extension we see the best guaranty of a still loftier evolution of our race." Dr. Pat-ten's *Heredity and Social Progress*, tho worthy of mention, as must be any product of the pen of so eminent a teacher, we must confess to be somewhat puzzling. A most careful reading has thus far failed to reveal to us what it is about. Professor Du Bois, on the other hand, with a simpler theme and a more direct manner, makes plain to every sensitive heart his message. That message is the pitiful injustice—industrial, political and social—meted out to the negro by his lords and masters of the Anglo-Saxon race in America.

IF regard is had to authority and weight, the most important historical work of the year is the seventh volume of the *Cambridge Modern History*, which deals with the United States. The work is done by a number of hands, and varies naturally in quality. Three of the chapters, written by Professor Mc-Masters, are in every way admirable;

they deal with "The Struggle for Commercial Supremacy," "The Growth of the Nation," "Commerce Expansion and Slavery." Another notable event in American history was the publication of the last volume of John Fiske's long series of studies. This work on *New France and New England* was, unfortunately, not entirely revised by the author and is somewhat scrappy in form, but has the merit at least of completing a great work. A volume devoted to a single time and a single question is that

JOSEPH MCCABE

by Mr. Dewitt on the *Impeachment and Trial of Andrew Johnson*; a monograph written with considerable literary skill, but not altogether impartial in tone. The author had access to private papers of Johnson's not hitherto used by historians. Mr. William Henry Smith has published an elaborate *Political History of Slavery*, in two volumes, which may be described as less encyclopedic but more philosophical than Henry Wilson's "Rise and Fall of the Slave Power." Mr. Smith was preparing a "Life of President Hayes," whose friend he had been, and came in this way to his more general historic work. A history directed, primarily, to determine disputed questions of fact is the *Siege of Quebec*, in six volumes. Among other things, this work tells finally the part played by Wolfe in planning the famous capture of the city.

Turning to English history, we find an excellent volume on *The Angevine Empire*, by Sir James Ramsay; a sober, solid narrative dealing with the period from the accession of Henry II to the death of John. The author takes pains to correct the dates of this period, which have fallen into some confusion, and, among other things, goes elaborately into the Becket controversy. Quite different in character is the *Reign of Queen Anne*, by Justin McCarthy, which succeeds in giving a brilliant picture of the great men who made that age comparable, in a manner, to the Augustan age of Rome. Another admirable history of a particular reign is Mr. Armstrong's *Emperor Charles V*. The author succeeds in keeping before the reader the multitude of questions which engaged the great Emperor, and sets forth very clearly the intricacy of his policy. The book is written in a bright, epigrammatic style and is not seldom picturesque. Less formally historic, but still dealing in historical subjects, are Mr. Bryce's *Studies in Contemporary Biography* and a revised edition of the late Mr. Lecky's *Leaders of Public Opinion in Ireland*. Sir Grant Duff, also, in his two volumes entitled *Out of the Past*, deals a good deal with the memories of men who were makers of history.

In biography we have Sidney Lee's solid and sober *Queen Victoria*, which may be called the authoritative life of the sovereign. Also the *Life of Pope Leo XIII*, by Monseignor Bernard O'Reilly. The *Life and Letters of Max Müller*, edited by his wife, give a clear picture of the long career of that scholar, but are somewhat lacking in vivacity. Far more interesting and anecdotal is the *Life and Letters of Sir George Grove*, which tells a little about most of the notable men of the past century. In American biography we have the *Life and Correspondence of Henry Ingersoll Bowditch*, equally well known as physician and abolitionist. Helen Keller's *Story of My Life* tells how Miss Keller contrived to win an education without the use of her senses, and is full of inspiration. Most interesting is Joseph McCabe's *Saint Augustine and His Age*, which presents a remarkably vivid picture of the great preacher's career. As the first of a new

series of Dent biographies we may mention Bolton King's *Massini*.

Two collections of letters should not go unnoticed; *More Letters of Charles Darwin* gives a fuller account of the naturalist's relations to his contempo-

raries than we had before, and the new *Letters and Memorials of Jane Welsh Carlyle* throw open again the bitter and now wearisome discussion as to the matrimonial relations of Carlyle and his wife.

Genuine Reciprocity

BY LUCIUS F. C. GARVIN

GOVERNOR OF RHODE ISLAND

[Governor Garvin, a Democrat, widely known as the leader of the movement against bribery at the polls in Rhode Island, was first elected to the office which he now holds in 1902, receiving a plurality of 7,738, although for many years the State had been Republican by majorities ranging from 6,000 to 14,000. On the 3d inst. he was elected for a second term, receiving a plurality of 1,587. The total vote was the largest ever cast in the State, and all the other State officers elected are Republicans.—EDITOR.]

IN the United States many divergent views are held concerning the tariff. Without enumerating the varied opinions, it is sufficient for the purposes of this article to say that there is one view of the tariff in which all coincide. Even those who maintain that the ancient wall is still a blessing, confess that in spots the ramparts are built too high.

Assuming, therefore, it to be generally admitted that a reduction of some tariff duties is desirable, the question arises, How shall it be done?

Various methods have been suggested and to each of them serious obstacles exist. The plans proposed and the objections raised against them may be stated concisely as follows:

1. *Immediate Free Trade, or Tariff for Revenue Only.*—Even tho this might be brought about in the United States with no more industrial disturbance than accompanied Peel's abolition of British protective duties, yet the proposition meets with such strong opposition as to place it at this time without the bounds of practical legislation.

2. *Gradual Reduction, or Reduction by Percentages.*—This plan, already tried in this country once, and attempted more than once, abounds in practical difficulties. It necessarily leads to business disturbance, due to the impossibility of accurately forecasting the future, and if a

progressive reduction is attempted, as under the Clay compromise of 1833, it is liable to be halted at any time.

3. *Free Raw Materials.*—Since raw materials can only be defined arbitrarily, revision in this direction gives rise to an endless dispute, and in the past has got no farther than a wrangle.

4. *Trust Articles on the Free List.*—This method is complex, difficult of just application, and, by lessening the exports of trust made articles, may result in a restriction rather than an extension of our foreign trade.

Moreover, to each of the four possible ways of reduction above recited there lies the one overshadowing objection that, while lowering our own tariff wall, it does not break down the walls erected against us by other nations. *Reciprocity*, on the other hand, possesses the enormous practical advantage of opening other ports to us at the same moment that ours are thrown open to them. By thus giving an impulse at once to exportation as well as to importation, it augments and extends foreign trade. Evidently a feasible plan of reciprocity, if generously applied, offers the means, least objectionable from every standpoint, of lowering the tariff duties.

Reciprocity was made a part of both the McKinley and the Dingley bills, drawn tho they were in the interest of

high duties. It must be admitted, however, that during the decade of their existence they have accomplished but little in the way of lowering the tariff or opening the markets of the world. In fact, so far as power is conferred upon the President of the United States to reduce duties

free list, it has scarcely been exercised at all. Furthermore, the exercise of the powers granted by the reciprocity provisions of the Dingley law, since a just discrimination is an impossibility, would be far more likely to foster jealousies than friendships in our foreign relations.

LUCIUS F. C. GARVIN

upon brandies, wines and a few minor articles to the extent of five per centum the provision of law is a picayune affair; and in so far as power is given to the President and Senate, by treaty if approved by Congress, to reduce duties twenty per cent., or to place upon the

And against all of the reciprocity provisions, both of the McKinley and the Dingley acts, stands the insuperable objection that they were a transfer of legislative functions from Congress either to the executive alone or to the combined action of the President and one branch

of Congress. The principle was so thoroughly bad that its failure need not cause surprise nor be deplored.

And yet the idea of reciprocity seems a very attractive and valuable one. The British Parliament, under its Conservative leaders, is giving consideration to a form of reciprocity between the mother country and its several colonies. The practical difficulties found in the way of the proposal are that it necessitates a change in the present free trade policy of Great Britain, and is really very complex in its nature, in that duties must first be imposed in order that they may be lowered in certain favored directions.

For the United States these difficulties do not exist. Here a high tariff is already established, so that the way is invitingly opened for reciprocal trade with other nations. The problem as it presents itself to this country is: How can a policy so promising as reciprocity be carried out simply, effectively and constitutionally?

My answer is: That it is only necessary to enact an amendment to the Dingley law, which shall read somewhat as follows:

Section ——. That whenever the Government of any country or colony of the Western Hemisphere fixes a time when it shall cease to impose duties or other exactions upon the agricultural, manufactured and other natural products of the United States, it shall be the duty of the President, when satisfied of the fact, to make proclamation thereof; and in said proclamation to fix the same day, or a date as soon as possible thereafter, on which shall be transferred from the dutiable list of this act to the free list thereof the goods, wares and merchandise being the natural products of such foreign country or colony, to be continued on said free list so long, and only so long, as said duties or other exactions cease to be levied by such country or colony. On and after the date fixed by said proclamation, articles from and produced by said country or colony shall be admitted free of duty. *Provided*, that whenever any such article is subjected to a tax under the internal revenue laws of the United States, the duty on said article shall be equal to such internal revenue tax, and that from and after the date

fixed by said proclamation, every such article shall be admitted, when imported into the United States, subject to a duty equal to the internal revenue tax.

Let us now assume, as is highly probable, that soon after the passage of an act, of which the above may be taken as a rough draft, many American countries will avail themselves of the opportunity of trading freely with this great nation; that, for example, Canada, Mexico, the West Indies, Brazil and other countries will enact laws for reciprocal free trade. What special and general consequences may be expected?

Our dutiable imports from American countries consist largely of "raw materials"—viz., lumber and coal from Canada; sugar and tobacco from the West Indies; animals, meat, hides and wool from Mexico and the other countries lying to the south of us. A remark of Goldwin Smith concerning the United States and Canada would also be true if applied to our relations with all the rest of America: "In their products they supplement each other."

So, through genuine reciprocity, a simpler and more profitable method than the placing of raw materials upon the free list unconditionally, our manufacturers in every section of the country will receive their materials more cheaply, our consumers everywhere will get at lower prices their meat, coal, woolen clothing, wooden buildings, sugar and shoes. The trusts which have so materially enhanced the cost of living by manipulating two of the most important items, meat and coal, will find their monopoly broken.

The larger importation at lower prices of the above classes of articles will lead to an increase of our export trade in two directions:

First, with the Western Hemisphere.

A frank invitation to barter, from which both parties are to profit, always affords encouragement to trade. Of our total exports of manufactures only 30 per cent. now go to this hemisphere—23 per cent. to North America and six and six-tenths per cent. to South America. Since the principal articles sent out are iron and steel, cotton manufactures, refined oils, cars and carriages, leather and its manufactures, and manufactures of

wood, it is evident that many sections, as well as many industries, will be directly benefited by their increased sale.

Second, with the Eastern Hemisphere.

With raw materials imported free from all that part of America which accepts our offer of genuine reciprocity, our manufacturers will be able to produce more cheaply, and, therefore, to compete more successfully in the markets of the world, including those of Europe, Asia, Africa and Australasia.

The genuine reciprocity contemplated by this act will in no way interfere with any other changes in the tariff which may at any time be deemed advisable. For instance, if, because of the sale of trust made articles abroad at lower prices than at home, Congress should think best to put them upon the free list, the free trade existing with other American countries would in no way prevent.

More than any other manner of changing our tariff ought genuine reciprocity to commend itself to men of all parties. The Republican party is committed to the principle of reciprocity. The Democratic party has based its opposition chiefly upon the methods heretofore proposed for applying the principle. No doubt there are interests, and even sections of the United States, which will decry the plan here suggested, but they comprise a proportion of our population so small and so shortsightedly selfish as to call for little consideration.

Inasmuch as hand in hand with every reduction in cost of material will go a larger market for the sale of articles produced here, the shock to industry will be slight—far less than by any other means of attaining so great results.

And the results will indeed be magnificent. To-day the United States derives a greater advantage from freedom of trade than any other country in the world. With a territory extending from the frigid to the torrid zone, and covering millions of square miles in the tem-

perate zone, with an interstate commerce ten-fold greater in value than our foreign commerce, it is to free trade, and not to so-called protective tariffs, that our material prosperity is due. And under the act here proposed the blessings of free trade already existing will be expanded enormously. As New York is benefited by unobstructed trade with New England, so she will be an equal gainer by unobstructed trade with Canada. As Texas and Louisiana are prospered mutually by the free trade existing between them, in like manner will both be benefited by similar relations with Mexico.

Carpers may ask, Why limit reciprocity to the Western Hemisphere? From the view-point of theory, it may be answered, we stand in a peculiar and closer relationship with this hemisphere. The Monroe Doctrine, universally accepted by our people, the Pan-American Congress, the Isthmian canal project, and even the nature of our treaties, all go to show and establish this fact. All-American free trade, therefore, would only be another, altho by far the strongest, mutual bond of friendship and brotherhood. Practically, moreover, the establishment of a genuine reciprocity would only constitute a part, and the least doubtful part, of what perhaps a majority of our people desire, to wit: The complete union of other American countries and colonies with the United States. Certainly so far as Canada is concerned we should at any time welcome annexation, and with Mexico, the ground for hesitation would be other than the consequent closer commercial relations.

Genuine reciprocity, tho limited to the Western Hemisphere, would be a long step toward abolishing all obstructions to trade. It may well prove to be the school-master which in due course of time shall bring us to a commercial brotherhood with all mankind.

PROVIDENCE, R. I

The Hungarian Crisis

BY FRANCIS KOSSUTH

[Our readers will remember the article we printed in our issue of August 27th, by Francis Kossuth, entitled "Possible Hungarian Independence." Francis Kossuth is the leader of the advanced Liberal party in Hungary and is the son of Louis Kossuth, the famous Hungarian revolutionist, who was so warmly welcomed in this country in 1851. —EDITOR.]

I N the United States little is known of the crisis through which we are now going in our Hungarian world.

This world is small, as compared to that of the powerful and happy world of the United States of America, which is, for us Europeans, the symbol of individual and political liberty.

This small world of ours is, however, dear to us Hungarians! We fought for it from father to son, for a thousand years, through glory and reverses; and we are proud, that our country has been—next to England—the oldest constitutional state in the world, and that it has been for two centuries the bulwark of Christendom against the crushing power of the Turkish invasion of Europe, at a time when all other states were unprepared to resist this last powerful attack, made in the Old World by the enemies of Christ against Christian religion.

Those who love liberty and those who love the religion of Christ cannot be indifferent, therefore, to what happens in this small world, which we call our own, in Hungary.

Our crisis is owing to a cause, similar to that which created the American Revolution—that is, our country was ripe for it!

The struggle of America for independence was Providential. It was a necessity. Those circumstances which

superficial consideration takes for the motives of the glorious American Revolution have been but accidental opportunities for it. Had those circumstances not occurred, others had occurred and had presented, perhaps, a different opportunity; but the Revolution would have come the same. It was a necessity, because the colonies of America had attained that lawful age in the development of all the elements of national existence which claims the right to stand by itself, and cannot more be led by a child's leading-strings, be the hand which leads it a mother's or a stepmother's hand.

These truths were spoken by Louis Kossuth in Lexington, in New England, and now this applies also to us; the Hungarian state has become strong enough, no more to be led by a child's leading string; and to enforce its rights, granted

not only by nature, but also by existing laws.

Every nation has a natural right to speak its own language and to wish that its language should be the official language in all the services of the state.

Besides this, our laws (Law 1867, No. XII, Art. 11) give us a right to have a Hungarian army.

Our laws (same law, Art. 13) give us a right to fix the condition on which we grant recruits to this army.

Now, a consid-

FRANCIS KOSSUTH

erable increase of recruits was asked for (about 20 per cent. of the whole army), and the country has put for a condition that the Hungarian language should hereafter be used in the Hungarian army.

We have a right to this; and we stand on our right, as against the pretention of our king to do as it may please him, just because we have a law which makes the king commander-in-chief of the army.

How would the citizens of the United States of America like it if the few but glorious regular troops of the Union were commanded in German, as the Hungarian troops are?

I doubt whether Congress would vote a cent for such troops; and I am sure that the Hungarian Parliament is right when it does precisely what the United States Congress would do.

BUDAPEST, HUNGARY.

Fables

BY BOLTON HALL

AUTHOR OF "THINGS AS THEY ARE," "THE GAME OF LIFE," ETC.

After Its Kind

A man bored a hole in a tree and a wood-pecker came and lived in it.

"The tree has conceived," said the man, "and has brought forth a bird."

Next year the wood-pecker went away and two flying squirrels lived in the tree.

"What a curious thing," said the man, "is Heredity."

Charity Organization

A Chinaman who was kindly disposed had a dog. He loved dogs. One evening he cut off the tail of the dog, and ate it. It was a sweet little dog—then he gave the bone to the dog.

A Caucasian who saw this said: "Your intentions are good, but you are pauperizing the dog. Providence, in its infinite wisdom, committed that tail to you as a trust. Had you turned the matter over to us we would have inquired if the dog was a deserving dog, and investigated as to whether he had other means of support, or relatives who would take care of him; if we found that he had none, we would have tabulated his case and judiciously given him one joint of the bone per day."

The Chinaman asked if that was Christianity.

"Well, no, not exactly Christianity," said the Caucasian, "but an outgrowth of it, which we call Systemized Charity."

Said the Chinaman: "That is better than heathenism—it is cheaper."

A Frightful Expression

There is no use in trying to repress ill-temper, or, indeed, anything else.

A little girl used to take dinner with her grandfather every Sunday, and she would say when she came home:

"Mamma, why don't you ever have 'poor man's rice pudding?'"

However, her mother always forgot it, until, finally, after the question had been repeated a number of times, her mother said one day, "Well, Effie, here is your 'poor man's rice pudding,' will you have some?"

"No, thank you, mamma," said Effie.

"Why, that's what you have been asking me to have for ever so long," said her mother.

"Yes, mamma, but I wanted you to know how horrid it is; we have it every Sunday at grandfather's."

So, how are we to find out how horrid our ill-temper is unless we sometimes have it out?

Good Soldiers

The other day I read that a large manufacturer had said, "No soldier can be a high-minded gentleman, because soldiers are paid butchers." Does it seem to you that soldiers are more blood guilty than we who contribute taxes to pay them and who sustain the system?

Yes, because they agree for money to kill people, whereas we are forced to pay taxes.

Are they more guilty than the man who holds land vacant so that thousands who might live on it starve?

They seem to me to be the more guilty, because the soldiers know what they are doing and the land speculators do not.

Then it is only the intention that makes the land speculator less guilty? In action they are equally at fault?

I suppose so. The effect of their action is the same.

It is even more terrible, is it not, for only a few soldiers ever torture any one and hardly any ever expect to kill any one, whereas our social conditions cause torture and death to thousands daily?

It appears that so far as the action is concerned, we are as guilty as the soldiers.

But why does a man speculate in land? Is it not because he must live?

He need not live; he can starve himself to death, or withdraw from the world, like a savage, producing or consuming nearly all the uses, or he may commit suicide.

But that does not solve the problem. Are not those merely ways of dodging one's share of the common burdens—of trying to live to ourselves?

But a man might refuse to pay taxes like Thoreau.

True, but if he lives at all he must buy things, and in the price of them he contributes his share of taxes to sustain this iniquity. We are all tax payers. Is not this true?

Yes, that is true.

And when we speculate in land or pay rent or sell land, we only do in bulk what every one does in detail.

I see that we have no choice. We must do these things to make or to get a living.

And do not some soldiers enlist because they must do so to get a living or get one?

Yes, some do, I suppose.

Then, such soldiers are really no more guilty than we are, even in intention.

It would seem so, but in any case, those who enlist from necessity are exceptions.

The great majority of soldiers join out of sheer brutality or love of adventure.

Yes, but does not the education to which most men are subjected, in Sunday school drills and military parades and cadet corps, make them brutal and ambitious?

It certainly tends, but men are different at birth.

Certainly, but if you should take the child of one of these soldiers (you know all your ancestors and mine have been fighting men), and should put him in harmonious and peaceful surroundings, he, or, at least, his grandchildren, would be as reluctant to agree to kill as you would be.

Of course, he would.

Then what makes these men guilty is really their training and environment.

True.

And you and I are a part of their environment and pay our share toward the training.

We do, indeed.

Then you and I seem to be as guilty in intention as the soldiers and it seems that we can none of us be any more high-minded gentlemen than the mercenary murderers whom we call the military.

I have not looked at it in that way, but it certainly seems to be true, for we are all one flesh, and no man liveth to himself, and no man dieth to himself. We profit by the virtues and excellences of others. Undoubtedly — and they by ours.

And is it not true, that each of us suffers for the errors of others, just as much or more than he suffers for his own?

Certainly, the fierce competitions, the distresses that the faults of others cause us, as well as their illnesses and premature deaths and infectious diseases, cause the most of our misery.

You believe, then, in an order and a justice in the universe?

Assuredly I do.

But all that would be unreason and injustice, were we not all equally responsible for our sins. Would it not?

I see no escape from that conclusion, but it weighs me down.

NEW YORK CITY.

Editorials

The Isthmian Canal Republic

SUBSTANTIALLY all of the hostile public criticism of our Government's action concerning Panama has been based upon the assumption or assertion that Mr. Roosevelt and Mr. Hay connived at the revolt and were secretly encouraging the revolutionists for some time before it took place. In support of this charge there is not a shred of proof. Extracts from those parts of the President's message which he had written a few days before the uprising (extracts now published with his consent) show that the action which he was then inclined to recommend was in no way related to an expected revolution. In a private letter, written three weeks before the revolt and recently published, he said:

"I cast aside the proposition made at this time to foment the secession of Panama. Whatever other Governments can do, the United States cannot go into the business of securing the results which it desires by such underhand means."

There is no evidence whatever that our Government or any one representing it was conspiring to assist the revolutionists who proclaimed their independence on November 3d.

It is quite plain that immediately after the revolt Mr. Roosevelt decided to take advantage of it in the interest of the construction of a canal, but not with the purpose of avoiding just payment for the rights and privileges involved. Since November 3d our Government's course has been marked by extraordinary haste, some inconsistency in details of procedure, and a disregard for precedents established in the history of our dealings with States set up by revolution. The instructions given to our Consul at Panama, on the 6th, were not in accord with the message sent at the same time to the Bogota Government. The Consul was to wait until he was "satisfied that a *de facto* Government, republican in form and without substantial opposition from its own people,

has been established." Colombia was informed that such a Government was in existence, and she was advised to deal with it. Precedents were ignored when full recognition was granted, on the 13th, to a Government only ten days old, which had no Constitution, had held no election, and consisted of a Junta of three revolutionists. No response to Mr. Roosevelt's message had been received from the Bogota Government. The views of that Government and its intentions had not been made known to our own. "We have entered into relations with the new republic," said the President to M. Bunau-Varilla. "It is fitting that we should do so now, as we did nearly a century ago, when the Latin peoples of South America proclaimed the right of popular government." But we did not recognize the South American republics until several years after they had declared their independence, and until the inability of Spain to subdue them had been clearly shown.

With these and other evidences of extraordinary haste should be considered our Government's very liberal construction of the treaty of 1846, which has served as a warrant not only for the exclusion of Colombian troops at any landing place on either coast of the State of Panama, but even for orders forbidding them to embark for the isthmus at the distant Colombian port of Buena Ventura. These orders have now been modified, because they were in effect an act of war; but troops so embarking are to be warned that they will not be permitted to land on the isthmus. The old doctrine that recognition of independence should be withheld until the new State's ability to stand alone has been demonstrated, and the danger of subjugation "by the parent State has entirely passed away," has nothing to do with this case, however, because the danger has been averted by the precautions of our Government. Colombia cannot subjugate Panama unless her troops are able to reach the Isthmus, and our warships say that they shall

not land there. The truth is that Panama's independence depends upon our protection, and is guaranteed by it.

But that protection is extended by the requirements of the treaty of 1846, as these are now defined by our Government. A fair critic must take into account this treaty at every step in his investigation. It justifies some acts that would have a sinister aspect if it were not in existence. It is of such a character that in the opinion of some authorities on international law it empowers the United States even to make a canal on the Panama route without the consent of either Colombia or Panama, if their approval of so reasonable and liberal an agreement as the Hay-Herran treaty has been withheld. We cannot see that it fairly covers all that has already been done in the present case.

If its provisions have been too liberally construed during the last two weeks, and if the course of our Government has been marked by extraordinary and somewhat suspicious haste, we should admit that our Government has not sought mere territorial aggrandizement or pecuniary gain, but the privilege of paying \$10,000,000 for the right to spend \$200,000,000 on a canal for the benefit not only of the United States, but of the entire civilized world. If Mr. Roosevelt and Mr. Hay have ignored sound precedents and gone beyond what many believe to be the fair limits of the old treaty, they have done this to defeat the greed and extortion of a selfish and unenlightened Government that is unable to build the canal and that has declined to make a reasonable agreement with the nation which must now be regarded as the only possible builder. Does the end justify the means? As to that there is room for an honest difference of opinion. It seems to us that the end ought to be and might have been gained with a more careful regard for all the proprieties.

The effect of all this upon our relations with the countries south of us can scarcely fail to be unfavorable. Mexico and the Central American republics will suspect that to some of our people a protectorate on the Isthmus must suggest the absorption of the territory north of it. The South American countries, heretofore distrusting (without cause) our

professions of unselfish friendship, will find in this affair reasons for greater distrust and even hostility. If it be true that Colombia had promised to use a part of the \$10,000,000 in paying the deferred interest on her foreign debt, the loss of it may so disturb European bondholders that we shall be drawn into fresh controversies involving the Monroe Doctrine. The anger of Colombia may increase the cost of canal defense and delay canal construction. Such evils it may have been impossible to avoid, but we should have preferred to see an earnest attempt to avoid them by a little more patience in the negotiations, and less display of force after they were interrupted.

"Give Us a Man"

"Give us a man of God's own mold,
Born to marshal his fellow-men;
One whose fame is not bought and sold
At the stroke of a politician's pen;
Give us the man of thousands ten,
Fit to do as well as to plan;
Give us a rallying-cry, and then,
Abraham Lincoln, give us a man."

So called Stedman's ringing voice in those dark days of the Civil War, when the Army of the Potomac marched hither and yon, aimlessly and uselessly, at the mercy of commanders who had no grasp of the situation, or were not morally big enough to sink their personal ambitions in their country's cause.

The terrible days of that gigantic strife have passed, but the nation's need of men of heroic mold has not disappeared. The interests of civic life are not less momentous than those of war, and the great problems of public policy and of social reform do not demand lesser gifts of broad intelligence, or a smaller measure of self-sacrificing devotion to the general well-being, than do those of military campaigns.

It is a discouraging thing to see a great political party cherishing traditions of personal liberty and of honest government, but hopelessly casting about for a worthy leader. The great party of Jefferson, and of Jackson, of Samuel J. Tilden, and of Grover Cleve-

land, is disorganized and aimless. It has no definite policy to inspire a following, and no man or group of men in its ranks is forthcoming to rally its forces for a strenuous fight upon issues of magnitude. The followers of Mr. Bryan in his earlier campaign were in desperate earnest, and the questions which they raised were real questions. They were argued to a finish, and decided adversely to the Bryanite creed. To-day the populistic elements of the party are discouraged, and no other faction has the enthusiastic faith in any great cause that might enable it to create a national organization.

In another way, but with even more of vital urgency, do we feel the need of men of mental and moral power in the struggle which our municipalities are making to wrest city governments from the grafters and the panderers to vice. In New York City we have had for nearly two years the best municipal administration that any city in the world has enjoyed in modern times; the wisest, the cleanest, the most progressive. Yet this administration has been repudiated by an overwhelming majority of the people, who have allowed caprice, selfishness and petty considerations to outweigh all the issues of civic welfare.

The situation that the election has revealed is clearly one that calls for a fearless recognition of certain facts which, whether pleasant or unpleasant, must be met. The people of this or of any other city will take narrow and unworthy views of their relations to the city government until they are inspired and organized by men of personal power, who command sincere respect, ardent admiration and loyalty.

The men that have devoted themselves to the interests of reform have been unselfish, so far as the policies which they have supported are concerned. They have been broadminded and judicious. Their failure has lain in their inability to get close to the people, to command that spontaneous allegiance which alone can be depended upon to hold the masses to any large plan of public activity. Mr. Jerome stated the situation perfectly the other day when he said that the cause of re-

form must have good men, with qualities otherwise like those of Richard Croker and "Tim" Sullivan.

One who has studied in history as well as in current politics this question of effective leadership can put his finger with unerring certainty upon the exact point of failure in the world's struggle thus far to unite enlightened and honest administration with democratic sources of power. The men that by virtue of a certain quality of hearty friendliness and fidelity to those that work for them have held the allegiance of the masses, have, as a rule, been too willing to use corrupt means to attain their ends, and have had no broad, disinterested view of public interests. The men of enlightened views and unselfish motives have too often been unsympathetic with the common man, too unapproachable, too cold and distant, to win a popular support. And, finally, the men who, being good and unselfish to a degree that has placed them in the category of saints or martyrs, and who by their warmth of human sympathy have held the allegiance of the multitude, have often been visionary or mystical in their aims, and have failed to obtain any grasp upon the really practical problems of their age.

Must we then believe that among the millions of men who make up the population of a nation like ours, there are none who combine the magnetism of sympathetic kindliness with enlightenment and integrity, and to these qualities unite the talent for political organization? The situation is not so hopeless. Rather must we believe that there is some failure in our political system to pick out by due process of selection the men that by nature are best qualified for the highest political leadership. The man that Stedman called for in his awakening verse was pounding away in obscurity at rebel regiments on the Western frontier. Lincoln found him in due course of time, and placed him in charge of the situation on the Potomac, where he won the Battle of the Wilderness. We must find a way to discover and to bring forward to positions of responsibility the men for whom the political world is waiting.

Bishop Gailor's Irenicon

WE extract this paragraph from what was called the most notable address delivered at the late Pan-American Conference of Episcopal bishops at Washington. Bishop Gailor, of the diocese of Tennessee, in opening his address on "The Attitude of Our Church Toward the Protestant Communions Around Her," said:

"In Memphis, last spring, I listened to a very striking and moving address, by General Booth, filled with stories that were pathetic and even thrilling: but when he reached his climax, and said, 'Friends, Jesus shed his blood to pay the price, and he bought from God enough salvation to go round'—I felt that his view of religion was different from mine. So I say that Protestantism in the Southern States is not to me a cheerful or rational presentation of Christianity."

It is a very crude view of the work of our Lord, the gross commercial theory of the Atonement, which still lingers more than we think in popular faith. But, as Bishop Gailor says, such teaching, partial as it is, "lifts men by the thousand from the mire and vice of sin into the power and purity of a new life in Jesus Christ." This illustrates the importance of embracing within the limits of charity and within the confines of the Church very divergent forms of theological belief.

Bishop Gailor's paper had a controlling influence in the adoption of the action favoring conference on union with Presbyterians and Methodists. We are therefore interested in his statement of what in his view are, or are not, the reasons that separate other denominations from the Episcopal. One of these barriers, he thinks, is the rubric which forbids admission to Holy Communion until one has been confirmed or is ready to be confirmed. Here we express a difference with the Bishop. So far as we can judge this has little weight. It might well be modified, but it is, we think, no particular occasion of offense. Most Churches have a similar rule and practice, and it is not very generally interpreted to exclude communicants of other Churches from occasional communicating in the Episcopal Church.

Bishop Gailor further says:

"I do *not* think that the refusal to change pulpits counts for very much. The fact that we require the use of vestments and the liturgical character of our services sufficiently justifies this lack of ministerial intercourse in the popular mind."

Here, again, we differ from the Bishop. Exchanging pulpits is nothing in itself; it goes by favor. But if the refusal to exchange pulpits is made a definite law, and is based on a denial of the parity of other clergy and other Churches, and the charge that their orders and sacraments are irregular and invalid, then it is an offense, and is regarded as arrogance and an insult. This is the nub of the whole matter. We know well enough that such is not the unanimous attitude of the Episcopal Church, and that many of its clergy of the Broad variety despise the doctrine, but it has so much vogue that it is popularly regarded as the position of the Church as a whole, and the canons of the Church have seemed to justify this view, at least since Stephen H. Tyng, Jr., was condemned and publicly reprimanded for preaching in a Presbyterian Church without the permission of the Revs. Boggs and Stubbs. If the refusal to fellowship clergy and other Churches can come to an end, Bishop Gailor will find the chief stumbling block removed.

Bishop Gailor makes one surprising criticism of his own communicating membership. He says:

"I do not believe that there is a body in Christendom which undertakes to carry so large a load of indifferent membership as does the Episcopal Church."

This is an extraordinarily careless statement. We do not believe that there is any larger proportion of indifferent members in the Episcopal Church than there is in the Lutheran or the Catholic, or the Greek or the Armenian Church, or in any other Church which admits all to membership by confirmation at the age of twelve or fourteen. Indeed, we should say that it stood, in character of membership, very nearly at the top of its class. We suspect that the Bishop did not exactly say what he had in mind.

Play as an Educator

THE value of play has usually been considered mainly from the point of relaxation. It has not been held that the child must play in order to become a real man or woman. The close custody of children during the best part of the day, inside the school house, seated on benches screwed to the floor, has been looked at, sentimentally, as a hardship for the children; but until very recently we have not looked upon the playground as inherently a part of the school house. Dr. Woods Hutchinson, in one of the current English magazines, takes the ground that play is a provision of nature, intended to bring out not only physical, but intellectual and moral growth. He undertakes to show that the development of large parts of the brain, and these far from the least important, can be directly brought about by muscular movements; while a considerable portion of the remaining area is secondarily affected by the same process.

"Exercise is literally the mother of the brain. Every play and sport worth the name develops not merely strength, endurance and sweetness, but also alertness, quickness of response, coolness, balance, wariness and judgment that is both sound and swift."

He thinks that athletics, in spite of occasional excesses, thoroughly deserves the high place that it has won in college training, and is in the very widest sense of the word a valuable part of education. When athletic training or games are carried to excess, it is due to our animal instincts, unrestrained by reason. He points to the fact that the speech-center of the brain is developed only on one side; on that side which controls and is nourished by the most highly trained hand. He argues further that the hand-center lies close behind the speech-center; which probably means that articulate speech depended upon the erect position being obtained—so freeing the forelimb for development into a hand. Naturally manual training has fought its way to the front in our educational system, to take its place side by side with brain culture.

The problem has been how to work

into our school system not only manual training, but some method of relaxation and recuperation which will enable the child to endure confinement and study.

The Civic Improvement League, of St. Louis, has adopted the plan of creating playgrounds, which are formally dedicated to the work of child-culture. These services aim to impress upon the parents of the children the importance of play and the necessity of maintaining the playgrounds to serve their highest value for young people. New York is making rapid strides, as well as Philadelphia, Boston and other cities, in this playground movement. Vacant lots are no longer entirely given up to refuse piles nor to potato culture, but are the scene of sand piles and other materials, where young children may have their gardens and playgrounds. It is possible to multiply these places almost indefinitely. When the idea thoroughly gets hold of the people, property owners will not be slow in dedicating unoccupied lots, and even valuable inclosures, to this holy crusade for health and growth. The individuality of the children must be taken into account very largely. Some of them prefer garden plots, where they can plant seeds, while other like best sheds and cottages, where they can keep pet birds and animals. Other children are naturally marine biologists, preferring a frog pond to the best farm or garden on the continent. Some children are never happy unless paddling in the water; others are just as natively devoted to swings, vaulting horses, trapezes and jumping bars. The ball player must always be counted upon as constituting a good large fraction of any group of boys, while many of the girls do not object to games of prisoners base, or even hockey and basket ball. In this country we shall always find a percentage of lads who have not lost the instinct expressed in "Robinson Crusoe" and "Swiss Family Robinson." Their happiness will not be complete while playing with the crowd. They must have something in retirement, and a chance to climb trees and build caves,—where their imaginations can riot.

Still keeping in mind that play is

education and essential to some of the most important features of brain development, some of our wise reformers are urging that these playgrounds, wherever they may occur about a city, be considered as part of the public school system; that teachers be appointed to have charge of the children at their play; which some of them argue should occupy at least half of the time now given to school exercises. Dr. Hutchinson urges that there would be this advantage, that we would get not only the direct culture which comes from play, but that the hours devoted to study of books would be so full of health and vivacity that twice as much would be accomplished in half the time. He urges that children of the laboring classes, who can spend only half their day in school, are now making as rapid progress in their studies as whole-timers. He insists further that those children who are not allowed to enter school till eight or ten years of age, coming with more physical vigor, soon overtake those who entered school earlier by two or three years. Stating the problem in other words, we are now called upon to consider whether a good deal of what we call education is not after all natural growth; and whether the very best part of the development of the child is not that which is least meddled with by school discipline. Give a child normal surroundings, will he not learn to use his brain wisely very much as he learns to use his legs and arms wisely? The school then ceases to be so much a place of positive control and discipline, a place for stuffing the child with knowledge and becomes a supplement to home life; and the teacher becomes a director of natural processes. Every child in the world desires to know; is full of curiosity about facts. Wisely handled, he need not be driven to application. He will find all that he can find out; and the school should have for its object to help him in his perfectly normal effort to discover and to learn.

Still this matter of play must not be allowed to drop into or become a part of the system in such a way as to be too much meddled with. The child's garden and the playgrounds, if under

the supervision of the schools, or a part of the school system, must after all belong to the child. He must be allowed to soil his clothes, and you must not put up the sign, "Keep off the Grass." Teachers in charge should not be meddling busybodies, officious either by temperament or by a sense of duty. Bear in mind all the time that we are not discussing the problem of school-gardens, where the pupils can be taken by their teachers to study botany and entomology; nor are we confining ourselves to the idea of enlarged school grounds, where the children may occasionally play at recess or at nooning; what we are arguing for is play as an educational principle, and that it enters very largely into the whole purpose of school life. The kindergarten idea we believe to have been falsely biased. The object of the true kindergarten is not to teach the children to work, but to teach them to play, or, rather, to enable them to play. The end of education is not to get away from play to work, but permanently to get away from the idea of work altogether. The secret of old age is knowing how to play when at work—that is, to accomplish what is necessary and wise to be accomplished with a joyous spirit.

The Spirit of New France

It is thirty-three years since Sedan. A new generation of Frenchmen has arisen that knew not Napoleon, even in the third edition, and it is becoming evident that they have other ideals and purposes than the worship of "*La Gloire*" and the duty of "*La Revanche*." Sentiments are not hereditary, and the experiment of educating a generation to enmity seems to have been a failure. There is a pathetic and yet encouraging scene in the recent novel of international politics by Vicomte Eugène Melchior de Vogüé, "*Le Maître de la Mer*," wherein an old general questions his former pupil, now returned from active service in Africa, to see if he has kept true to the lessons of patriotism, much as a mother questions her son on his return from his wander-year as to whether he has retained the habits of devotion in which she has trained him.

The young captain confesses that he had rarely even thought of Alsace-Lorraine, and ventures to say that he considers it more important to see that France secures her share of Africa than to recover the lost provinces. He says:

"Our democracy no longer wishes what it still feigns to hope for. It complains from habit of an affliction it no longer feels. It applauds the orators who promise it reparation at a banquet, but it would not pardon the man who would wish to make a harsh reality of this beautiful dream."

But to the veteran:

"All the empires of Asia and Africa are not worth one acre of the soil where I fought and was vanquished. You people do not understand. She, whom you dutifully mourn as dead, is to me living; waiting and calling for me yet."

Seldom in literature has been portrayed more strikingly the way the returned emigrant sees his native land as in this book. Somewhat as the houses and distances of our birth town seem shrunken when we return to it in after life, so to this young captain, fresh from the exploration of a great and empty continent, the squabbles of the home people, anti-Semitism, anti-clericalism, personal animosities, seem petty and contemptible. He has been breathing a freer and more inspiring atmosphere and leading a healthier because more useful life than that of the *caserne*. He sees in the colonies the only hope of his country; for as he walks down the boulevard he counts the foreign names, English, American, German, Jewish, which glitter in gold and dazzle in electric lights on the buildings on either hand, and he concludes that the barbarian invasion has captured this citadel, the Gallic Forum, "the spinal cord of the civilized world, the nervous center from whence radiate all intellectual movements, all illuminations of the spirit."

"Soon we shall need a pocket dictionary to promenade the boulevard." "If we would defend our soil against the invading races, the Anglo-American of to-day, the Slav of to-morrow, the Japanese and Chinese, perhaps, of the day after, we must act on the offensive; we must raise up a new people upon new soil, and reconquer the Place de l'Opera at Lake Chad."

This plea for colonization and emigration for its educative effect, its teaching

of wider ideas and truer valuations, is the strongest of the arguments for that policy. We hear voices in the West continually complaining of the narrowness, of the lack of patriotism and timidity of the people of the Atlantic States. Whether there is any justification for this accusation of provincialism in politics, commerce, religion and social matters, with which the children thus charge the old folks left on the farms, or not, it undoubtedly would have been their dominant mental vice if the inhabitants of the Thirteen originals had been content with their "natural boundaries" and had never rolled down the mountain side into the Ohio Valley. France, in its *ennui*, its overcultivation of non-essentials, its petty quarrels, its timid capital, is a type of what the United States would have been if it had never expanded. Travelers in Italy tell us that they can distinguish by their more prosperous and enterprising appearance those villages which have sent forth the most emigrants to America.

But to preach emigration to a race diminishing in numbers, in stature, perhaps also in native ability, overloaded with taxes, conscription and burdensome institutions inherited from the past, is something of a mockery. Colonization and imperialism, whether military or commercial, need a large and growing population. There is no reason to think that an extended centrifugal movement on the part of Frenchmen would have any other result than more rapid depopulation of the mother country and more extensive immigration of foreigners to occupy the land; an intensification of the evil complained of.

It will be remembered that Zola in his last days looked to the same source for succor to his distressed country. In "*Fécondité*" the climax is where the wandering son bursts in upon the family feast with report of the new France to the southward, where are increasing and multiplying their children's children with the manifest destiny of inheriting the earth, a vision of unlimited generations such as Macbeth saw in the witches' mirror. Unfortunately for this hope the French colonies have for the most part been of the type which reduces population instead of increasing it, and have

been a drain on the fatherland, both in men and money. They have been parasites rather than rootlets. From the \$20,000,000 a year spent on its colonies France as yet has received no adequate return either in commerce, new thought or new blood. Algeria and the Congo are more promising than those colonial graveyards, Tonking and Madagascar, but so far it is only promise.

Even M. de Vogüé seems to despair when he comes to consider ways and means; for to speak of Africa is to remember that France once had control of Egypt and failed where England has succeeded, a victory not of war, but of industry. He points out that commercial conquests are more permanent and valuable than military. Business rules the world and armies and navies are merely their servants. But French money "is lazy and cowardly, while American money is audacious, joyous and adventurous. Their money is intelligent; ours is stupid. These Yankees, which we lightly regard as savages, have at least the praiseworthy fetishism of savages when they approach the great queen, Science; they offer her millions to extend her empire."

Captain Mahan seems to have impressed the French as much as the Germans, and M. de Vogüé insists that in order to become colonizers France must become mistress of the seas, but more in a commercial than a naval sense. "A nation without sailors is like a bird without wings." Empires founded on land, however extensive, have been weak and ephemeral, while single cities with the sea power in their hands have dominated the world. It was a trading company which conquered India and gave it to England. Rhodes and Carnegie are to be substituted in the minds of the people as fitter for hero worship than Napoleons I and III.

And besides these requirements it is essential for a race aspiring to domination that its rule be just and not oppressive. It is this which has enabled the Anglo-Saxons to establish a world-empire. "If there was a plebiscite among all the sons of Adam as to which race they would choose as most apt to insure the reign of justice, liberty and peace, each would naturally name his

own, but the second vote would go without doubt to the Anglo-Saxon."

All through the recent literature of France there appears a spirit of frank self-criticism which is in strange contrast with the chauvinism formerly so dominant and offensive. With all its extravagances and in part false aims, the tone of the writing of the present time is much better than in the periods of bluster and of despair which preceded it. It may not be time to replace the statue of Strasbourg in the Place de la Concorde with one of Timbuktu, but it is certainly time that she be permitted to go into half mourning, and lay aside the funeral wreaths which have burdened her so long.

A Ducal Wedding

The United States pays its maiden tribute annually, and oftener, to the ducal minotaur. They go proudly to the sacrifice, all garlanded and bejeweled, and no Perseus arises to deliver them. They are dukes, drakes and rakes of all degrees and all European nationalities that carry them off, each flaunting a gaudy title, and all demanding maidens worth their weight in radium. Such a wedding was celebrated last week in this city, when an American girl of wealth and social position was wedded to a Scotch duke. There must now be half a dozen American duchesses in Great Britain. This wedding gave occasion for certain coarse comment, cabled to this country, on the assumed display of lavish wealth, by an English journal, altho no unusual display was made, and the affair was in sufficiently good taste as church weddings go; but the display of vulgar curiosity by the crowds that blocked the church was most offensive. It is not that our people so dearly love a duke; but dukes are such rare birds with us, and the papers had made so much talk about the wedding, that thousands of silly sensation hunters flocked to the church and crowded and almost mobbed bride and groom, quite overrunning the fifty policemen, who could not use their clubs on well dressed women. The remedy is not more dukes from abroad, but more sense at home, which it is hard to supply. We do not wonder that foreign dukes and lords, pecunious and impecunious, want our girls; but we venture the

general forecast that those who wed at home will win the happier life.

A Citizen of the Best Type

To no other man have the people of the city of New York been more deeply indebted than to the late Andrew H. Green. His long life was a grand record of devotion to public interests. For nearly half a century, beginning when he entered the Board of Education, his untiring energy, fruitful imagination, practical knowledge of affairs and unswerving honesty were continuously at the service of the municipality. To his labors was due the development, and practically the creation, of Central Park as it exists to-day. His were the plans in accordance with which the great museums of art and natural history were established. In response to his suggestions there was given to the people by his intimate friend, Mr. Tilden, the munificent gift for a public library. To him the people turned with confidence when an honest and thoroughly competent man was needed to guard the city's financial interests, immediately after the downfall of Tweed, and his six years' work as Comptroller was no small part of the public service for which he will be remembered. His energy was manifested successfully in many and diverse fields of activity. In his later years he was justly called the father of Greater New York, for the consolidation of the distinct municipalities that are now parts of one great whole was due in large measure to his influence. The city is full of his monuments, altho none of them bears his name. It is most deplorable that the life of such a man, entitled to the respect and gratitude of millions of his fellow citizens, should have been ended by the bullet of a lunatic.

Books of the Year

We have taken stock again this year of the books that have passed through our offices, winnowing out the few that seem to possess more than passing interest or value, and gathering them together into a brief survey. The process is disheartening on the whole. There are so many books printed, so many that mean time and labor for the author, labor and money for the publisher, money and time for the reader—

and disappointment for all. They lie in a literary office,

"Thick as autumnal leaves that strow the
brooks

In Vallombrosa;"

and the chief lesson to be learnt from their coming and going is merely this, that there are vastly too many of them written and printed. They seem to represent no tendency and, as a mass, to illustrate no intellectual aim—we speak of them in the gross, not of the few. And it becomes more apparent every day that Lowell's dictum was right: "There can be no American literature until we have an American criticism." It is for this reason that we scan with particular attention the critical works that come before us and count them of special importance. Unfortunately, the present year has produced not a single American book of this sort in any way really notable. As for the innumerable writers of novels and travels and poetry—we except always the worthy few—it would be well for them to visit the literary office of a great newspaper or magazine. They would learn a new meaning in the cry of Æneas to the Sibyl:

"Foliis tantum ne carmina manda,
Ne turbata volent rapidis ludibria ventis."

The Kaiser's Case

The announcement from Berlin that the German Kaiser had undergone an operation for polypus of the larynx gave a thrill of anxiety even in spite of the subsequent reassuring news. In spite of the assurances on the part of the distinguished specialists who performed the operation that the tumor is certainly benignant in character, there must, of course, remain some doubt in the matter. Laryngeal tumors are prone to degenerate malignantly even when there are no suspicious signs about them at first. The announcement from Professor Orth, who has succeeded Professor Virchow in the Chair of Pathology at the University of Berlin, that the material removed consisted of very soft connective tissue in the shape of myxomatous degenerative processes, adds something, of course, to the value of the assurances given by the laryngologists, tho even he reserved his judgment as to certain

cellular parts requiring further investigation. Every one recalls, moreover, that in the case of the present Emperor's father portions of tissue removed on three separate occasions were submitted to Professor Virchow, the greatest of living authorities, who was never able to detect the slightest sign of malignancy, tho there is no possible room for doubting now that a malignant process was all the time at work and was responsible for the tumorous projections on the vocal cord. Not until near the fatal termination were the laryngologists able to remove enough tissue to secure a genuinely characteristic specimen. The fact that the Kaiser's father and mother both died of cancer adds not a little to the interest of the case. There is practically no doubt now in the minds of most experienced pathologists that heredity is a distinct factor in the etiology of cancer, and that in something over thirty per cent. of the cases a cancerous history in the immediate progenitors can be found. When, as in this case, the cancerous taint exists in both the maternal and paternal ancestry, there is no doubt that the danger of even an originally benignant tumor degenerating malignantly is greatly increased. If, as here, it exists in a situation where it is likely to be the subject of frequent irritation then the eventual outlook of the condition is indeed serious. The most recent advices with regard to the details of the operation show the tumor to have been not of the pedunculated variety, at first reported, but of sessile type with broad base. This usually indicates a distinct tendency to infiltration rather than limitation of growth, and is an index of added danger. In spite of recent very encouraging advances in medicine and surgery our present knowledge of these conditions is no more definite than a decade ago, when the Emperor Frederick's case was attracting so much attention. Patient observation for many months will be necessary to decide the momentous question, which we sincerely hope will be eventually favorable for the monarch who in our generation has most earnestly endeavored to fulfil the duties of his high position.

The Indian "War"

The meager reports thus far received indicate that the conflict which occurred in Wyoming last week between a sheriff's posse and a party of Sioux from the Pine Ridge agency was as unnecessary as it was lamentable. The Indians with a permit from their agent were crossing the northeast corner of Wyoming en route from South Dakota to Montana to visit the Crows, and the temptation to replenish their meat supplies from nature's shambles was too strong for them. The necessity for and authority of game laws is always hard for the descendants of buffalo hunters to appreciate, and the right to hunt in Wyoming was the last privilege which the Sioux relinquished as they passed from the life of the hunter to that of the ration eater. The question of placing the blame now turns on the question as to which side fired the first shot, and it may be that the only ones who knew are the two white men and the five Indians who were killed. Since five more Indians were wounded and ten are under arrest, and the rest of the party, about fifty, have headed for their reservation, it is quite evident that the Indians had no war party spirit. Instead of submitting to arrest by the sheriff for violation of the game laws, they decided to return to the agency, and it was on their way back next day that they were intercepted by the posse and the firing occurred. Away down the tap root of the trouble is doubtless the feeling which voices itself whenever an Indian man is designated as a "buck"—the feeling that he is an animal, to be put out of the way when he interferes with the human known as the white man. The charge that the Indians were peculiarly exasperating by reason of their wanton waste of the game killed is too un-Indian-like to be credited. An Indian uses every part of an animal except the bones.

If the Lily Whites in Louisiana or Kentucky propose to leave the Republican party because they are offended at the President's distribution of offices, let them go. They belong with the Democracy; let them return to its fold.

Insurance

Home Accidents

THAT it is the unexpected that always happens is quite as true of accidents as it is of other things. When a man goes on a railway journey he expects accidents, that, as a rule, do not happen. The estimate that railway traveling is about as safe as anything a man can do has been pretty well established within recent years. And yet men continue to insure against railroad accidents. It is true that whether on or off trains no one is free from the possibility of accidental injury. It is also true that always and ever in the midst of life we are all subject to accident and death. The man who says "I shall, I think, be likely to be free from the chance of accident at home" frequently reckons very far wrong, as is strikingly set forth in a late number of *The Traveler's Record*. Among the 400,000 accident claims paid by one casualty company, a large proportion were paid because of accidents that took place in the homes of those holding policies under which claims were made. Among these causes of accidents were the following: Falling out of bed while asleep, the striking of the insurer's toe against a chair, razor cuts, slipping in bathtubs, cutting meat at table, opening fruit cans, explosion of beer bottles, slipping of ladder while putting up window shades, stepping on needle, the breaking of a pitcher while cleaning the same, slipping and falling on polished floors, the spilling of acid from bottle, the wrenching of a shoulder in putting on coat, the entangling of a hand in a dog's collar, stepping on broken lamp chimney, stumbling over children's playthings, carrying child upstairs, the breaking of bottles while extracting corks, the falling of windows on hands, falling out of windows, cutting due to the breaking of window panes, accidents from lamps, cut from household chisel, saw wounds, falling from chairs, breaking of chairs, moving barrel of cider, blaze from chimney, match burns, putting up stovepipes, falling down stairs, etc.

From the cases here mentioned the conclusion is perhaps justified that a man under the ordinary conditions of life is seldom in greater danger than he is while going down stairs in his own house. The hazard from home accidents is much more to be feared than the average man thinks, and such accidents may well be viewed with alarm alike by insurer and insured.

Insurance of Agricultural Engines

A VERY hazardous class of risks that steam boiler insurance companies do not favor and write only reluctantly as accommodations for their agents is that of agricultural engines. In connection with harvesting machines these engines, costing between two and three hundred dollars, are during the harvesting seasons constantly roaming about the large grain fields of the West and Northwest. The fields in which they are used are remote from town centers, which makes proper inspection of the engines practically impossible, and settlements in the event of loss tend toward adjustments that are not always satisfactory. Losses are generally very expensive. Another objection to risks in which agricultural engines figure lies in the fact that those who operate them are for the most part unskilled, which largely increases the risk. The great amount of chaff necessarily flying about during operation adds greatly to the hazard and makes it so pronounced that conservative underwriters are more and more reluctant to cover it, even when large premiums are obtainable.

ADVICES from Savannah state that the City Council of that city has taken action which will make impossible the future erection of frame houses within the city limits. This was done because of a condition imposed upon the city that action such as this should be taken in order to have a first-class rating in insurance circles.

Financial

The Knickerbocker Trust Company

ONE of the most beautiful buildings in the city is the new banking house of the Knickerbocker Trust Company, at the corner of Fifth Avenue and Thirty-fourth Street, opposite the Waldorf-Astoria Hotel, on the site formerly occupied by the A. T. Stewart mansion. The building is of Grecian architecture, four stories in height, designed by McKim, Mead & White. The Corinthian columns

The New Building of the Knickerbocker Trust Company, Fifth Avenue and Thirty-fourth Street.

and porticos have a most imposing effect. The Knickerbocker Trust Company has branch offices at 66 Broadway, 125th Street and Lenox Avenue and 148th Street and Third Avenue, Borough of the Bronx. The company has a million dollars capital, its surplus and profits are almost two millions three hundred thousand dollars and its deposits are nearly forty million dollars. The officers are Charles T. Barney, President; Frederick L. Eldridge, Joseph T. Brown and Julian M. Gerard, Vice-Presidents; and Frederick G. King, Secretary and Treasurer.

THE Government's November report indicates a corn crop of 2,313,000,000 bushels, a quantity exceeded only in 1902, when the crop was 2,523,648,000 bushels.

....Four hundred shingle mills in Western Washington, where 50 per cent. of the shingles used in this country are manufactured, have formed a trust, or an association, for the restriction of output and the maintenance of prices.

....This season's output of gold in the far northern Nome district of Alaska is \$6,000,000, of which \$2,000,000 is credited to the little city of Council, which has a summer population of 3,000, and is supplied with electric lights, water works, churches and public schools.

....Advance sheets of "Poor's Manual" for 1903 show, for the railroads of the United States in the fiscal year 1902, the following increases: Gross earnings, \$108,000,000; net earnings, \$39,800,000; dividends, \$18,800,000; bonded debt, \$430,000,000; capital stock, \$99,500,000; passengers carried, 54,600,000; tons of freight, 108,000,000.

....During the past thirty years the Middlesex Banking Company, of Middletown, Conn., has placed nearly thirty million dollars in real estate mortgages, and has sold them or debentures representing them, and no investor has suffered delay in the payment of principal or interest when due. In times of financial nervousness and uncertainty, such as we have recently been experiencing, there is no investment which can be turned to with such a feeling of security as mortgages upon real estate.

....Dividends announced:

Amer. Express Co., \$3.00 per share and extra \$1.00 per share, payable January 2d.

The Independent

VOL. LV NEW YORK, THURSDAY, NOVEMBER 26, 1903 No. 2869

Survey of the World

A New Canal Treaty Signed An entirely new Canal Treaty was signed in Washington on the 18th by Secretary Hay and M. Bunau-Varrilla, the Envoy from the Republic of Panama, only two or three hours before the arrival in that city of the three Commissioners from Panama, who had landed at New York on the preceding day. Altho it is understood that these Commissioners had been empowered to ratify the treaty in behalf of Panama, it was decided at Washington that ratification should take place on the Isthmus; and, therefore, their presence was not essential. A report that the signing was hastened by knowledge of some objection on the part of the Canal company to certain provisions of the treaty relating to the exercise of the power of eminent domain is denied by the company's counsel, who says the treaty is most satisfactory to those whom he represents. The Commissioners will start for Panama on December 1st, bearing the treaty, which, it is said, will be ratified by the Panama Government before December 10th.—In its preamble, the treaty refers to the Spooner Act (a copy of which is annexed) and apparently assumes that the power given by it may be used in dealing with the new Republic, in which the sovereignty of the required territory is now "actually vested." An important Article is the first one, as follows:

Article I. The United States guarantees and will maintain the independence of the Republic of Panama.

Use, occupation and control of a canal zone ten miles wide are granted "in perpetuity," and of "any other lands and waters outside of this zone" that may

be "necessary and convenient" for the "construction, maintenance, operation, sanitation and protection" of the canal or of any auxiliary canals or other works needed. The grant covers all islands within the zone as extended three marine miles from the shore, and the islands of Perico, Naos, Culebra and Flamenco in the Bay of Panama. To the United States are granted, within the limits mentioned, "all the rights, power and authority which the United States would possess and exercise if it were the sovereign of the territory within which said lands and waters are located, to the entire exclusion of the exercise by the Republic of Panama of any such sovereign rights, power and authority." But the cities of Panama and Colon, with their harbors, are not included. We have also a monopoly in perpetuity for the construction and operation of railways or canals across the territory of the Republic. The usual provision for damages to private owners of property is made. We have the right to buy or acquire by eminent domain in the two cities the lands or other property required for the canal or for municipal sanitation. At our expense the two cities are to be supplied with water and sewers, and we are empowered to enforce sanitary ordinances in them. All of Panama's rights in the concessions to the Canal company and railroad company are acquired; and Panama authorizes the Canal company to sell out to the United States. The two ports are to be free, so far as canal traffic is concerned; the canal is to be neutral in perpetuity; Panama's troops are to be carried free of charge; we are empowered to use our armed forces, and to erect fortifications, for the

protection of the canal; and Panama agrees to sell or lease to us lands for naval and coaling stations. The sums to be paid are the same as in the Hay-Herran treaty, \$10,000,000 at the beginning and \$250,000 per annum after the lapse of nine years.—A long conference was held by the Democrats of the Senate, and they were unable to agree upon a course of action. Mr. Gorman's plan—to insist that the President now take up the Nicaragua route—was not accepted. Several Senators permitted it to be known that they would vote for the Panama treaty.—M. Bunau-Varilla declares that Panama will pay to Colombia no part of the \$10,000,000. European owners of Colombian bonds hold that Panama should now assume a part, say one-third, of the Colombian foreign debt. It is said to be the opinion of our Government that some share of it might reasonably be carried by Panama; but M. Bunau-Varilla declares that the bulk of the debt was contracted 80 years ago, and that Panama has enjoyed no benefit from the proceeds of the bonds. The bondholders are willing that Panama shall be independent, but they ask their Governments to withhold recognition unless the new Republic shoulders a share of the old obligations. J. P. Morgan & Co. have become the fiscal agents of Panama in this country.

Colombia and the New Republic

Peace commissioners representing the State of Bolivar arrived in the harbor of Colon on the 16th. On board the "Mayflower" they met representatives of the Junta, who told them that Panama would never again become a part of Colombia. On the 19th, Generals Reyes, Holguin, and Ospina, a Peace Commission from the Colombian Government, arrived at the same port from Savanilla. Owing to the excited condition of the people they were not permitted to land, but were invited to become the guests of the United States on one of the war ships. This invitation was declined, and they remained on the French steamship "Canada," where they were met by representatives of the Panama Government, who firmly rejected all their overtures, asserted that the action taken was irrevocable, and gave notice

that no Commission from Colombia would hereafter be received unless recognition of the Republic at Bogota should precede its arrival. Whereupon the opposing groups took breakfast together and then went ashore, the Colombians walking arm-in-arm with the revolutionists between files of Panama soldiers, and then driving through the town before returning to their ship. General Reyes, now apparently the leading figure on the Colombian side, started for Washington. In a published statement he said that Admiral Coghlan had told him that the landing of Colombian troops on any part of the Isthmus would not be permitted. He might propose at Washington, he added, the return of the Isthmus to Colombia and a removal of the Colombian capital to Panama. If he should fail to reach a satisfactory agreement at Washington, "the United States would have to fight the entire Colombian people and there would be a second Boer war." He could raise an army of 100,000 men, build roads, and subdue the Isthmus in two weeks if the United States would permit. He would rather die for the honor and integrity of his country than sit still and see the loss of the Isthmus. President Roosevelt did not realize, he thought, the serious nature of the precedent; it would stimulate the German colonists in Brazil to establish their independence. He denied that Cauca and Antioquia were inclined to secede; the Colombians were united.—The rumor as to such an inclination in Cauca and Antioquia has not been confirmed. Panama does not desire to be associated with them, believing that such an extension of the Republic would open the door for the usual South American domestic quarrels.—There has been communication between our Government and Colombia through the agency of our Minister at Bogota, altho Colombia has persistently ignored her own Minister at Washington. At first it seemed impossible for Colombia to understand what had taken place. Then, realizing that Panama's independence had been recognized, her Foreign Minister sent to Minister Beaupré a long statement, asserting that the United States had threatened to "take painful measures" if Colombia should fail to ratify the treaty without modifica-

tion; had, after November 3d, become the ally of the rebels, indicating that Colombia must accept the situation or fight; had violated the treaty of 1846, and had taken action inconsistent with its dealings with Texas and its protests, forty years ago, against the recognition of the Confederacy. Colombia, he added, was willing to submit to the Hague Tribunal the question whether the treaty of 1846 had been violated. She could not continue diplomatic relations with us unless we consented to permit her to subdue the revolutionists.—President Marroquin has given to the press an "Address to the American People," in which he virtually asks them to repudiate the acts of their Government, these being in violation of the old treaty and at variance with our "glorious traditions." Colombia, "in danger of losing the best part of her territory, which always has been respected by the nations as a sacred trust confided by her to the honor and power of the American people," appeals, he says, "to the National conscience of the United States."—Reports from Bogota say that the Government awaits the result of General Reyes's mission. The prevailing expectation is that there will be war, and 100,000 volunteers are said to have offered their services, Liberals uniting with Conservatives in the patriotic movement. President Marroquin has appealed to all the South American countries for sympathy and support. Our Minister at Rio Janeiro telegraphs, however, that Brazil is ready to recognize Panama whenever formal application shall have been made, and the newspaper which represents President Roca, of Argentina, remarks that the United States was fully justified in recognizing the Republic, owing to the anarchy which has prevailed for years in Colombia. Guatemala's President remarks that our action was wholly within our rights and that he will respect the sovereignty of Panama. The President of Chile expresses sorrow and a hope for a peaceful and honorable settlement.—The documents sent to the Senate show that on November 2d Rear-Admiral Glass, at Acapulco, was directed to proceed to the Isthmus, and there to maintain free and uninterrupted transit, preventing the landing of any armed force, either Gov-

ernment or insurgent, with hostile intent at any point within 50 miles of Panama. If in doubt as to the intent of an armed force, he was to occupy Ancon Hill with artillery. On the 3d, a bulletin in Washington having reported an insurrection, our Consul, at 3:40 p. m., was instructed to keep the State Department informed. At 8:15 p. m. he replied that no uprising had yet taken place, altho the situation was critical. At 9:50 he reported that there had been an uprising at 6. He was instructed to prevent Colombian troops from going to Panama from Colon. Delayed dispatches from Minister Beaupré, dated November 6th, indicate that President Marroquin offered to decree the ratification of the canal treaty if our Government would maintain Colombian sovereignty on the Isthmus.

Reciprocity with Cuba

After four days' debate, the bill to make effective the treaty of reciprocity with Cuba was passed in the House, on the 19th, by a vote of 335 to 21. Names were not recorded, but it is known that those who voted in the negative were mainly Republicans from Michigan and Minnesota, and Democrats from Louisiana and Texas. A rule excluding amendments had been adopted by almost a strict party vote, six Republicans opposing it. The Democrats desired to amend the bill by repealing the present differential tariff duty on refined sugar and by rejecting that provision of the treaty which seeks to prevent for five years a reduction of the Dingley duty on sugar by treaty or convention with any other country except Cuba. Just before the final vote was taken, the Democratic leader's motion to recommit with instructions to report the bill thus amended was ruled out of order. His party then accepted the bill as a step toward a general reduction of tariff rates. In the course of the debate, Mr. McClellan, of New York, sharply attacked the administration of General Wood in Cuba, asserting that the latter had saddled upon Havana for ten years an infamous gambling monopoly. Mr. Grosvenor, of Ohio, undertook to forecast the result of the Presidential election, counting 263 electoral votes as surely to be cast for

the Republican candidate, giving the Democrats 151, and setting aside 62 as doubtful, among these the votes of New York. On the other side there was much talk about the tariff, and reference was made to recent sales of a large quantity of steel rails to buyers in Arabia at a price of about \$22.75 at the port of delivery, which is said to be equivalent to less than \$19 at the mill in this country, altho the pool's uniform price at the mill to American buyers is \$28. The bill having been sent to the Senate, notice was given there on the Democratic side that it could not be passed before the end of the extraordinary session, but a proposition was made that there should be an agreement to dispose of it in the regular session on a date to be named. This was at first opposed by Speaker Cannon and many of his Republican associates, who held that a failure to take final action before the end of the present session would be discourteous to the President. An agreement was reached, however, that a final vote should be taken on December 17th, and that the present session should end on the 25th inst.—Senator Newlands has introduced a joint resolution inviting Cuba to enter the Union as a State, with Porto Rico attached as a county or province.—A resolution from Mr. Williams, the Democratic leader in the House, declares that the House would regard with pleasure any steps taken by the President to reconvene the High Joint Commission for the purpose of promoting more liberal trade relations with Canada.—Among the new bills is one from Senator Lodge for the exclusion of immigrants over 15 years old who cannot read English or some other language, and one introduced by Senator Penrose to pension all who served on the Union side in the Civil War, including even non-enlisted persons who served thirty days under the orders of the War Department or of any military officer of the United States.—There have been received many additional petitions against the admission of Senator Smoot, who denies that he is a polygamist in practice, asserts that he could not take an additional wife with the approval or consent of the Mormon Church, denies that the Church interferes with politics, and declares that his first allegiance is to his country. His oppo-

nents have made preparations for a vigorous campaign.

The Case of General Wood

Almost at the beginning of his term of service in the southern islands of the Philippine archipelago, General Leonard Wood has found it necessary to put down a formidable Moro insurrection. At last reports the troops under his command had killed more than 300 insurgents with no loss of life on the American side, altho Major H. L. Scott and five privates were wounded. General Wood landed near Siet Lake, in Jolo, on the 12th, and began fighting at once, driving the insurgents through a rough country until they made a stand in one of their towns. From this position they were promptly dislodged. After a battle in the swamps on the 16th, the insurgents left behind them 76 dead; on the following day 40 more were killed. On the 18th General Wood started in search of another body of 2,000 Moros, said to have been organized in the mountains. The killing of so many insurgents was probably due to an effective use of two batteries of artillery, which are a part of General Wood's small force.—The committee hearing as to the nomination of General Wood to be a Major-General was begun in Washington on the 19th. Altho the doors were closed, extended reports of the testimony have been published. Major Rathbone preferred charges relating to General Wood's communication with the Cuban courts at the time of his trial, and to the Jai Alai concession. Senator Hanna's argument against confirmation was based upon the case of Major Rathbone, his friend. The War Department submitted a commendatory report upon General Wood's military record. Major James E. Runcie is coming from Cuba to testify concerning his *North American Review* article, in which he attacked the administration of General Brooke, whom General Wood was afterward to succeed as Military Governor of Cuba. It has been asserted that this attack was made in the interest of General Wood, with whom Major Runcie was associated. In behalf of General Wood there was published, last week, the correspondence between him and Secre-

tary Root concerning this article, showing that General Wood at first defended Major Runcie, saying that he accepted the latter's assertion that the article had been a confidential paper and had been published without his consent; also that this defense was withdrawn upon the production of a letter in which Major Runcie's consent for the publication of the article had been clearly given.

**The Federation
of Labor**

At the annual convention of the American Federation of Labor, last week, the Socialists were defeated by a vote of 11,282 to 2,185, after a very earnest debate which consumed two days. The pending question was upon an adverse report of the Resolutions Committee concerning nine resolutions submitted by the Socialists, setting forth their principles and calling for action by the Federation as a political party. Among those opposing the Socialists was John Mitchell, who asserted that the attempt to commit the Federation to Socialism was a great mistake, and that it would be a sad day for organized labor if the unions should become the tail-end of a political organization. President Gompers spoke very earnestly and with some bitterness, closing the debate with these words addressed to the Socialists: "Economically you are unsound, socially you are wrong, and industrially you are an impossibility." The vote on the same question in the Federation's convention one year ago was 4,897 to 4,171. Unanimous support was given to a resolution against "the open shop" in the Government service as well as in private business. President Roosevelt was asked to examine again the evidence against W. A. Miller, the assistant foreman of the Government Bindery, whose case has excited so much comment, and to remove him if the evidence were found to be true. No one opposed a resolution calling for the exclusion of Japanese and Koreans, as well as Chinese, and for a strict enforcement of the exclusion laws in Hawaii and the Philippines. One of the resolutions adopted advocates the direct election, by popular vote, of the President, Vice-President, members of the Cabinet, Senators and Justices of the Supreme Court. A vigorous campaign in behalf of organ-

ization is to be carried on in Philadelphia. It was reported that the political machines, the moneyed interests and the newspapers in that city were trying to destroy the unions. President Gompers was re-elected, receiving 12,524 votes against 1,134 for Ernst Kreft, candidate of the Socialists.

Santo Domingo In the early part of last week fighting continued in the outskirts of San Domingo, but President Gil, with one thousand troops, was able to keep at bay the larger investing force of insurgents. On the 22d, however, President Gil, seeing, apparently, that his case was hopeless, announced that he would retire from office and permit the country to be governed by four members of his Cabinet, pending a permanent settlement of affairs. Whether this will be accepted by the insurgents we do not know at this writing. Minister Powell has frequently cabled to this country in regard to the situation, which he regards as very grave, and the "Newport" has already relieved the "Baltimore" at San Domingo City, where she is protecting American interests. An agent of the insurgents has attempted to gain recognition from us for the insurgent Government, but our State Department declines to have Panama used as a precedent in this case, and has refused to have anything to do with the insurrection as long as Minister Powell, who is on the spot, refuses to recognize it. It is also reported that President Gil is willing to offer this Government Samana Bay, one of the finest harbors in the West Indies, for a coaling station, in exchange for the United States' support of President Gil's Government. The State Department, however, has received no official intimation of this offer.

**Italian Royalty
in England**

On Tuesday, November 17th, the King and Queen of Italy reached Portsmouth and received the Prince of Wales on board the royal yacht, who came to welcome them to England. From Portsmouth they traveled direct to Windsor, where they were entertained by King Edward and Queen Alexandra. On Wednesday there was an elaborate banquet in St. George's Hall, the great

Norman gallery of the castle. The guests, who sat at a long table which was decked with the famous service of gold plate, included the foreign Ambassadors in England and many notable Englishmen. Ambassador Choate, with the Duchess of Connaught, entered the banquet hall immediately behind the Duke of Connaught and the other royalties. King Edward's toast "To their Italian Majesties," was a graceful little speech, and was responded to by King Victor Emmanuel in clear, fluent English. On the next day the Italian party went to London, where they were received with a good deal of enthusiasm. Among the ceremonies of the day were a luncheon in the Guildhall, at which the King received an address by the City Corporation, handsomely embellished and in a gold casket, and a reception given by the King and Queen at the Italian Embassy to all members of the Italian colony in London who cared to be present. The King's manner is described as being firm but amiable. On Saturday, amid much ceremony, the party took their departure. As the royal yacht was leaving Portsmouth a megaphone message from King Victor Emmanuel to King Edward was shouted over the water—which does not seem so very royal after all. On Friday the Italian Foreign Minister, Signor Tittoni, who accompanied the King, had a conference with the British Foreign Secretary, Lord Lansdowne, and an agreement was reached between the two countries on matters affecting their foreign policies.

England West and East

At a meeting at Newport Mr. Chamberlain addressed a large audience, consisting chiefly of workingmen, and roused them to a high pitch of enthusiasm by his presentation of the tariff question. In conclusion he recited Tennyson's "Britons, Hold Your Own," whereat every man in the assembly leapt to his feet, cheered, and waved his arms until exhausted. Again, at Cardiff, before another audience composed largely of workingmen, he received the same kind of attention. At Cardiff he declared that "the unrestricted free imports policy of this country for the past fifty years

is doomed." And again, at a reception at the Colonial Office to bid farewell to the Agents-General of the Colonies, he said that he had now the almost assured conviction that he had been able to convince his fellow-countrymen of the advantages in adopting his fiscal policy.—England is preparing to invade the sacred land of Thibet. Some time ago a mission under Colonel Younghusband went to Lhasa to discuss with the Thibetan authorities their failure to observe treaties and the consequent injury to the trade between India and Thibet. The Dalai-Lama treated the mission most cavalierly, sending subordinates to meet them and refusing to receive them unless they retired into Indian territory. Colonel Younghusband thereupon fortified the camp and returned himself to report to the Viceroy. As a consequence he is now leading a considerable force of troops into Chumbi Valley, the key to Thibet, and from there he will advance on Gyangtse, an important center some 150 miles from Lhasa. The Thibetans show a disposition to resist the invasion and fighting is quite likely to occur.

French Politics

There is a state of confusion in the French Senate over the proposal to exclude members of religious orders from the intermediate schools and thus to extend the sphere of the Associations Law. Two irreconcilable statements have been made respectively by the ex-Premier, M. Waldeck-Rousseau, and the present Premier, M. Combes, and these have created a complicated crisis which the Opposition hopes may seal the fate of the Government. There are two measures to be considered. One, the more moderate plan, was advocated by the Minister of Public Instruction and has received the support of M. Waldeck-Rousseau; the other more radical measure was advocated by a committee of the Senate. At a subsequent sitting, one of the Government's supporters in the Upper Chamber, M. Girard, proposed an amendment to the effect that one of the conditions for the authorization to open an intermediate school should be a declaration that the applicant had not taken vows of obedience or of celibacy. The

confusion created by the differences between the Government's supporters is increased by the suspicion that there is a similar conflict of opinion in the Cabinet itself, and that in reality the Prime Minister inclines rather to the radical solution of the committee than to the moderate and less effective scheme of his Ministerial colleague. The situation is further complicated by the circumstance that the Opposition is supporting the moderate scheme in order to place M. Combes in a dilemma between his most trustworthy supporters and his less advanced colleagues in the Cabinet. As a result of the Governmental confusion it is commonly expected that M. Combes will resign from the Premiership. Until recently he hoped that his disagreement with the Parliamentary majority might be patched up, but now he has apparently lost such a hope. It is only the influence of M. Jaurès, the socialist leader, that gives him any hold at all over Parliament. He will, therefore, resign, it is said, on January 15th, a date which will permit him to see the budget through, preside at the Ministerial receptions on New Year's Day, and confer a number of decorations to which he has pledged himself.—In a recent speech M. Combes said that the question of the separation of Church and State would probably come before Parliament in the course of the ordinary session of 1904, and the Government would then show that it desired to put an end to the indefinite and confused state of things which, if prolonged, would disturb the moral tranquillity of the country. With respect to the Education bills at present before the House, M. Combes said the Government, while maintaining the principle of liberty in its proposals, would demand the right to close by decree establishments giving an education opposed to the Constitution, the laws and the morals of the country.—It is reported that another forgery, attributed to Lieutenant-Colonel Cuignet, has been found, of such a nature as entirely to exculpate Dreyfus of the charges for which he has been pardoned, but never really acquitted. The case is to be reopened soon by the Court of Cassation when the results of General André's investigations will be brought to the light.

Germany Reports announce that Emperor William's throat is healing properly, and already he is walking out even in cold and wet weather. It is said that he will go to some southern part of the Empire to pass January and February, and so escape the bitter winter weather of Berlin; this plan, it is declared, has nothing to do with the operation performed on his throat, but is merely advised by his physicians in order to restore his general health.—The court martial of Lieutenant Bilse has turned out as was expected, and the guilty officer is condemned to six months' imprisonment and dismissal from service, while all copies of his novel, together with the plates and type, are to be destroyed. Lieutenant Bilse, who is only twenty-five years of age, served until recently in a battalion of the army service corps at Forbach, in Lorraine. He did not bear an entirely savory reputation in his regiment, and he lived beyond his income, contrary to service regulations. Last September he obtained his discharge, but before doing so, and while an active officer of the army, he published a sensational novel, giving a scandalous picture of the life in a small army garrison. A number of the officers and women of the garrison were introduced into the book in such transparent disguises that they were immediately recognized. The trial, which resulted in the condemnation of the author, brought out a number of facts which went to show that the life in the garrison was pretty much as Lieutenant Bilse had described it.—Another book which has made a sensation is a volume, entitled "From a German Prison," by an ex-convict named Hans Leuss. Leuss had been a leading member of the Reichstag, but was convicted of perjury in a divorce suit in order to save a woman he loved. He passed three years and four months in a prison in Hanover, and five years after his release he published this attack on the German prison system. He maintains that the treatment of the convicts renders them mentally and physically incapable of earning a living after their discharge from prison; they are scantily clad, poorly fed, and, in many prisons, the lash is still the official instrument of punishment.—The recent elections in Prussia

brought to the light once more some curious features of that system. The electors in each ward of a constituency are there divided into three classes, in proportion to the amount of direct taxation paid. The combined votes of each of the three classes have an equal value, an arrangement which sometimes produces anomalous results: thus, for example, in one ward, Unter den Linden, a single taxpayer is the whole number of the first class, while the second class contains only six voters; the ward which comprises the Wilhelmstrasse contains so many rich electors that all who pay less than about \$3,000 a year in taxes are placed in the third class, which includes the Imperial Chancellor, Count Von Bülow, and a half-dozen other Prussian Ministers and Imperial Secretaries of State. In this election, for the first time, the Socialist Democrats deemed it worth while to vote, thinking that in some cases they might promote the return of Radical candidates for seats which had hitherto been held by Conservatives.

Bavaria and the Empire

One of the questions constantly open in Germany is the relation of the individual States to the Imperial Government, and the danger of the so-called "unitarian" movement, which would result in breaking down the barriers between the States. This question was recently discussed at length in the Bavarian Chamber, where it is always likely to assume a particularly urgent form. The debate originated in a discussion of the estimates and brought in the resignation of the Bavarian Minister-President, Count von Crailsheim, and the appointment of Baron von Podewils, who enjoys the special confidence of the Clericals. A proposition has been made to institute a new Ministry of Communications, a department which has hitherto been associated with that of the Bavarian Foreign Office. The Liberals were determined to have the functions of the Bavarian Foreign Ministry sharply defined before they would approve the proposed change, since they are opposed, like the majority of the Prussians, to the particularism which they see in a separate

Bavarian diplomatic service and in the position of the Papal Nuncio at Munich. The Clericals, on the other hand, proclaimed the necessity of maintaining the rights of Bavaria as a sovereign State against the "unitarian" tendencies which, as they think, threaten from North Germany. One of the rights to which Bavaria clings pertinaciously is its separate postal establishment. In reply to the various objections raised, the new Minister-President, Baron von Podewils, declared that the relations of Bavaria to the Empire, as well as to Prussia and the Federated States, were in every respect satisfactory. He admitted that many complaints were heard of a "unitarian" movement, and that efforts toward that end might exist here and there, being inspired by a conviction that the future of the Empire lay in that direction. He regretted this movement as a political mistake, but said there was no reason whatever to fear its prevalence in the Empire; if it should become prevalent, the Bavarian Government would oppose it with all possible energy. And, even if such a situation should befall, the successful opposition of Bavaria would depend largely on her cordial relations to her partners in the Empire. Those who were responsible for the conduct of the Empire were, however, profoundly convinced that its strength rested on the federative basis of the Imperial Constitution. In this connection, he alluded to his recent visit to Berlin. The appointment of the Bavarian statesman, Baron von Stengel, to the office of Secretary of State for the Imperial Treasury, he said was a welcome distinction conferred on Bavaria and a recognition of the efficiency of the Bavarian bureaucracy. Alluding to negotiations for new Imperial Treaties of Commerce, he added that the Imperial Government kept the Bavarian Government intimately informed of all that was taking place, and that Bavaria was directly represented in these negotiations. As regards the proposed payment of members of the Reichstag, he declared that Bavaria was not opposed, on principle, to this measure, if certain guaranties were given.

Public Football vs. Naval Education

In Defense of the Naval Academy

BY PARK BENJAMIN

AUTHOR OF "THE HISTORY OF THE UNITED STATES NAVAL ACADEMY," ETC.

ON November 28th there will be played at Franklin Field, Philadelphia, a football match between teams chosen from the midshipmen and cadets of the National Academies. It is easily the most spectacular contest of the kind which the country affords, since not only does it attract a throng of spectators fully as enormous and enthusiastic as is found at any of the great intercollegiate games, but brings directly before public gaze the high officials of the Government and the entire student bodies of both institutions.

The scene is a most brilliant one. The full corps of cadets in their severe grey and black uniforms collects on one side of the arena. The brigade of midshipmen glittering in blue and gold forms another and opposite group. Both are singing and shouting at the top of their lungs. The superb military bands of the two schools, gorgeously bedecked, are playing in turn. The colors of the Academies flutter everywhere. With the cadets is a great array of officers of the army, and heading them the Secretary of War. With the midshipmen gather the Admirals and the naval officers, together with the Secretary of the Navy. All official Washington is here; the Cabinet officials, the diplomatic corps—everybody who can get away from his desk or portfolio. The Secretary of the Navy, the Superintendent of the Naval Academy and the Admirals solemnly cross the field and felicitate the Secretary of War. The Secretary of War, with equal solemnity and with an equally distinguished company, returns the visit. The crashing forth of the national anthem by the combined bands announces the arrival of the President of the United States, and then the teams line up, and the hurricane which is to last for the next two hours breaks loose.

There is a growing opinion, shared by many of the older officers of the navy

and other graduates of the Naval Academy, that the policy which is thus making the natural and stimulating rivalry between the Government schools into the occasion for a public gladiatorial show is one to be deplored. The objection is not to contests in football or in any other athletic sport between the two Academies, if reasonably and properly restricted, but to the *public* conditions under which this yearly game is permitted to be played. It is believed that the consequences of this publicity are distinctly harmful to the students and detrimental to the national interests. The present purpose is to submit the reasons.

The course at Annapolis, as at colleges generally, extends over four periods of eight months each. The average age of the midshipmen on admission has been between sixteen and seventeen years. The object of the school is to produce naval officers—and nothing else. The enormous progress of late years in all that pertains to marine warfare requires that they shall be highly trained technicians.

At the age of sixteen most youths destined for learned professions have at least two years of primary instruction before them, then four years of college and then three years at the professional school—an aggregate period of nine years. The young naval officer must obtain all of his scholastic preparation in less than one-half this time, and a part of it must be devoted to drills and practical instruction afloat and in the machine shop. Every minute of his life at the Academy, therefore, must be wisely utilized.

For his athletic welfare there is ample provision. He is taught to dance, to fence, to row, to box and to swim. He has an admirably equipped gymnasium, tennis courts, running track, football and baseball fields, and, of course, almost ideal facilities for every kind of boat exercise.

Some thirteen years ago, a football

rivalry sprang up between the two Academies. The game was played for four consecutive years alternately at West Point and Annapolis, the team of one school visiting the other. It was then officially prohibited. When it was resumed in 1899, it changed from a private contest to a public exhibition held in a distant arena; and since then it has become a great national sporting event. What the effect is likely to be upon immature and impressionable minds is not difficult to conjecture. Naturally, from the day the Academy opens in October until the day of the struggle two months ahead, the game is the all engrossing topic. The interest excited is far beyond that which the college student bestows on his 'varsity team, for outside his books and dividing his leisure he has many activities which military discipline here forbids. The Naval Academy is something akin to a cloister. It is a narrowly circumscribed community, with very little to do with the outer world. To the dwellers within it the sudden transition from its orderly routine to the tumultuous theater is an event of bewildering magnitude. Those who are chosen to receive the plaudits of the vast throng become young demi-gods. The democracy of the school breaks down before them. Superiority in work where all have exactly equal chance is no longer the sole reason for pre-eminence. Expectation becomes a fever, adulation runs riot, and neither is limited only to the midshipmen.

The opponents of the public exhibition believe that such a disturbance is unjust to the student and unjust to the people who are educating him. They deny that the efficiency of the school can be maintained if for two months out of the eight in every scholastic year an overwhelming distraction of this sort is to prevail. They hold that it weakens the sense of duty which above all things is sought to be instilled—for to tell a boy that he is paid to learn, not for his own benefit, but for the benefit of his country, and, therefore, has a duty to perform, and then, contrariwise, to give him a temptation to slight that duty, is certainly not conducive to self devotion. They deem it unjust to the student, since his interest and attention being diverted

from his work his class standing is imperiled.

The line officers of the navy are arranged in one straight line from Admiral to the lowest midshipman. After they are graduated from the Academy, in order of merit in their respective classes, their relative positions never change, except when advancement in numbers for special heroism is earned in war or a court martial decrees the reverse. If a boy loses place in his class, he loses place in the ladder of promotion. Whether he is graduated at the top or bottom of his class may determine whether or not he shall reach an Admiral's stars. In no other calling does a boy's college standing thus directly influence the success of his entire professional career. Therefore, any distraction which seriously impedes the devotion of his whole powers to his work simply thrusts him down.

It cannot be too strongly urged that at the Naval Academy the conditions of the civil college do not prevail. It is not a school for general culture. It is a machine run by iron discipline, which countenances no relaxation, and for a precise end. There is no "may," but "must." The work is not chosen by the student, but prescribed and enforced. His whole existence during every waking hour is charted in advance. This must be so in order to get the necessary work done in the time allotted. The work must be done in the time allotted because the naval officer must get to sea young, and not later than his early twenties. The standard of efficiency is nothing less than 66 2-3 per cent., under penalty of abrupt termination of his career. Any external interference with such a system as this is like interference with a mechanism—it impairs the machine and it impairs the product.

The promoters of the public game insist that it develops military qualities and personal heroism. Its opponents contend that so far as this may be true, the cause is in the game and not in the publicity. For the collegian destined hereafter to sedentary pursuits, to the confinement of store, factory or office, the strenuousness of the gridiron is a salutary tonic. It does him no harm to enhance this to the uttermost limit, and to gather

far and wide his elder brethren to join in the festival and shout with him *haec olim meminisse jurabit*. But what game is needed to better the work of a school, expressly and in every detail designed for no other purpose than to accomplish those precise results? Drills of the infantry brigade, drills with field artillery, drills at the guns afloat, drills in boats under oars, drills in naval tactics in boats under sails, drills aloft on the yards of the practice ship, drills in torpedo boats, both surface and submarine; drills in the engine rooms and stoke holes, every one of them hard physical work, do not exactly suggest the need of the stimulus of the public amphitheater to develop military energy. Is not the naval life strenuous enough? Have the naval officers of the United States ever shown such deficiency of courage and skill that this new factor is needed in their education? Is it the sort of strenuosity which the shouting multitude demands of the struggling athletes which decides national disputes? Or is it that fine discernment which can wisely substitute brains for guns? This is the quality which, before all, the Naval Academy stands for and essays to teach. If public football, with all its accompaniments, is a help to that end, then by all means let us frankly establish a chair for its instruction and to the Academic faculty add a professional coach.

No good reason is apparent why every possible benefit derivable from the inter-Academy game cannot be achieved by having it played on Academy grounds, exactly as it was during the first four years, and exactly as it is now between the midshipmen and teams from the colleges on occasional Saturday afternoons. Why ignore the teaching of experience? Is it not well known that the Yale-Princeton game, which formerly took place in New York City, and the Harvard-Yale game, held at Springfield, now are played on the college grounds of one of the antagonists, and that the college authorities required this change from what used to be called "neutral ground" because of the demoralizing effect of taking the student bodies away from their home fields? As for the character of the playing of the midshipmen, it is in the nature of things inferior to that ex-

hibited by the students of the great universities. They average much less in age, and instead of from 1,800 to 4,000 men from whom to select, they have but six hundred, and half of these are this year's freshmen. Adequate time for practice they never get. The rigid routine must be maintained. They snatch what moments they can, sometimes at daybreak, sometimes at the expense of meal recess, sometimes by electric light after nightfall. Their best opportunities, are, as stated above, when college teams visit them; but whether these particular games are an unmixed blessing is a question. When the individual whose profession is war gets defeated there is, to the untutored lay mind, something lost in the way of prestige which the civilian does not imperil; and when he is badly defeated, people who do not know the handicap under which he strives are rather apt to fancy that his end of the national defenses may possibly need looking after.

At no time in its history rather than now has the Naval Academy more urgently needed to husband its energies for its own proper work. It is undergoing the obliteration and rebuilding of its home, and its students are living in wooden sheds. It is receiving classes larger than ever before, the last one equaling in numbers all the others in attendance put together. New methods are to be tried, new courses established, new disciplinary measures devised—and yet the work must go steadily on. It certainly would seem that at no time could any external disturbance be more fraught with confusion, or tend to render more difficult the task imposed on those charged with the practical reorganization of the school.

It has often been shown in these columns how multifarious the calling of the naval officer has become—how he must combine in one person the attainments of seaman, gunner, engineer, astronomer, chemist, diplomat, and so on through a category almost incredible in length and variety, but all necessary—at some moment, perhaps vitally necessary—for the national safety and honor which we entrust to his care. Again and again are we told that good men even in bad ships are better than bad men in

good ships; and it is an article of our belief—strong because we want to believe it and insist on believing it—that our naval officers are the best and will continue to be the best.

Is it consistent with the production of such best men, or, indeed, with the proper conception of the duty which we ask of these boys whom we are educating to perform, that we should keep their interest distracted for a quarter of study year and then take the whole of them *en masse* from their school in the very midst of its work, transport them to a distant city and there make them into a public spectacle?

To reduce the efficiency of the Naval Academy is to impair the efficiency of

the personnel of the navy, and at its very fountain head. Of this the danger is not remote, but present and imminent; for, such is the dearth of naval officers, we are now entrusting to these boys immediately upon their graduation from the Academy the charge of the decks of our finest battle ships. In the daytime and at sea, and while midshipmen, they are now replacing lieutenants in actual control of the ship.

The responsibility to the people for the state of affairs against which this protest is made lies not with the Naval Academy nor with its officials, but directly rests upon the Secretary of the Navy.

NEW YORK CITY

General Leonard Wood's Promotion

BY THOMAS M. ANDERSON, LL.D.

BRIGADIER-GENERAL U. S. A., LATE MAJOR-GENERAL VOLUNTEERS

IT is claimed that in mathematics, as in ethics, there are exceptions which prove the rule. That figures never lie can be disproved by any expert in mathematical legerdemain. But can an ethical proposition be proved or disproved arithmetically? Possibly not, yet there is a certain fascination in the application of the test. Let us take as an example, the case of Major-General Wood, M.D., LL.D.

He accepted the position of assistant surgeon in the army August 11th, 1886, a little over seventeen years ago; he served twelve years in the medical department and five years in the line. There are 22 generals in the fighting branch of the service. What are the records of the other 21?

As given in the army register, General Young has served 42 years; Chaffee, 42; MacArthur, 41; Bates, 42; Wade, 42; Sumner, 42; Randall, 42; Kobe, 41; F. D. Grant, 14; Bell, 25; Funston, 5; Baldwin, 42; Wint, 42; Lee, 42; Carter, 30; Bliss, 28; Sanger, 42; Moore, 42; Haines, 42; Carr, 41, and Barry, 26. Out of this number of line generals General Wood has been promoted over fifteen.

Nor is this all; for, not counting the many who have died and been retired since his advancement, he has been promoted over 67 officers of cavalry, 66 of artillery and 150 of infantry. He has also passed over 27 adjutant-generals, 16 inspector-generals, 35 quartermasters, 11 judge advocates, 27 commissaries, 27 paymasters, 49 engineers and 28 of the ordnance. Lastly, but not least, he has jumped over 70 of his own corps. In all 596 of higher rank and longer experience passed over in five years. This would seem to indicate that in this, our generation, the scalpel is mightier than the sword.

Let us now mix a little history with our service salad. The great Duke of Marlborough owed his first advancement to the questionable influence of his sister, Arabella. Napoleon is believed to have received the command of the army of Italy from Barras's approval of his marriage to the widow Beauharnais. General Wood's influence has been attributed to the fact that he was at one time family physician to a member of Congress who subsequently became President of the United States.

Whatever favoritism was shown in the

cases of Marlborough and Napoleon found ample justification in their subsequent careers. Marlborough proved to be an able diplomatist as well as a great soldier, and Napoleon proved himself to be a great administrator as well as an unequaled strategist. General Wood is conceded to be a good civil administrator, but he has not yet given proof of military capacity.

Historians generally rate engagements in which the loss is less than a hundred as combats rather than battles; by this rating, the only battles of our late war were those of El Caney, the taking of Manila, and our battles with the insurgents on the 5th of February, 1889. Taking this standard, General Wood never commanded even a brigade in battle. Where, then, does his claim for exceptional advancement come in? Clearly the only justification for it is that he is unquestionably superior in administrative ability to all those over whom he has been promoted.

To say that he has, either before or since his advancement, shown greater capacity than the fifteen generals over whom he has been promoted, is to make a very large assumption. Yet if he has this greater ability to serve the State, all personal considerations should be disregarded. "*Salus populi suprema lex.*"

It must be said, in justice to the War Department, that it has apparently been influenced less by an intention to advance favorites than by its purpose to inaugurate the General Staff method of administration.

Years ago, when the line of the army was signing petitions in favor of the Burnside bill, it was understood that the General Staff was intended solely to introduce a co-ordinating principle in army administration. Now it begins to look as tho it were simply a reorganized bureaucracy.

There is a tendency to imperiousness in this impersonal method which tempts its chiefs to forget the distinction between the technical illegal and the inexpedient; to take an office man, who has never set a squadron in the field, and make him a field general is a manifest abuse of discretion. There is truth in the aphorism, that what is best administered is best. Yet, is it best to take away all oppor-

tunity for the development of initiative by centralization?

Under representative government there may be no danger that our War College will crystallize into an Aulic Council, yet we are starting out on the theory that victory can be organized. The administrative successes of Carnot, Stanton and Moltke are cited in proof. Yet Carnot's assumed organization of victory would have failed had not Moreau, Massena and Hoche been superior to the generals opposed to them, who were operating on a system assumed to be entirely orthodox. Stanton's force as War Secretary would have availed but little but for the generalship of Grant, Sherman and Thomas. Moltke, besides being an organizer, was also a great general. Unquestionably, a sound, military system is essential to success, yet it must be supplemented by the ability of generals and the warlike character of a people.

But in inaugurating its new method the War Department has eliminated from the army nearly all the generals of the Civil War. Over one hundred officers of this class have been induced to retire by a bribe of a higher grade. The last general officer who entered the service before the close of the Civil War will be retired in 1909. The last adjutant-general of this class will be retired in 1906, the last Civil War surgeon in 1905, and the last of the engineer and ordnance in 1907. In the cavalry there are only 21 Civil War veterans left, in the artillery 26 and in the infantry 19. Thus in the line of the army out of 2,900 officers there are only 66 veteran officers left to explain the custom of war in like cases to the men of the new army.

The school of experience should still find a place in our military curriculum. Our War College seems to be founded on the assumption that there is wisdom in a multiplicity of councils. Without questioning this theory, attention may be invited to the well known saying, "That councils of war never fight."

This leads back to a fundamental: That back of staff systems and all administrative systems lies the brain power of one man, the man for the place and the hour.

SANDUSKY, OHIO.

Colon, from the Sea

The New Republic of Panama

BY DR. MANUEL AMADOR

[Dr. Amador is the Minister of Finance of the new Republic of Panama, and arrived in this city last week on his way to Washington, where he will confer with our Government in regard to affairs on the Isthmus. Though now seventy years old, it is quite probable that Dr. Amador will be the first President of Panama. He has exerted great influence in promoting the revolt, and his son, a surgeon in the United States Army, has been appointed Consul-General of the Republic at New York.—EDITOR.]

I HAVE just come from the new Republic of Panama and am a member of a commission appointed by the Government there and accredited to the Government here with a view to bringing about a thorough understanding of our mutual relations and aiding in expediting a satisfactory canal treaty.

The Republic of Panama comprises the territory formerly included in the old State of Panama. It contains only about 300,000 people, of whom 30,000 are in the city of Panama. There are many foreigners, Germans, French, English and people of the United States.

Tho our country is so small we hope

A Street in Panama City

for happiness and prosperity under the friendly protection of the United States. At the same time there is no thought among our people of annexation to the United States. We hope to maintain our independence.

We fully expected that Colombia would pass the canal treaty as offered by the United States. The rejection amazed us and made us indignant. Colombia was not only throwing herself in the way of the world's progress for the sake of blackmailing the United States, but she was also, by her greed, endangering all the business interests of Panama, which demand that the canal shall be completed and operated without delay.

Had we had no other fault to find with Colombia, this was quite enough, and the revolution was begun by the intelligent and progressive natives of Panama getting together and deliberating. They held many meetings at private houses and it was determined to secede and set up for ourselves.

What was going on was well known throughout the Isthmus, and there is therefore nothing astonishing in the fact that the Government at Washington anticipated the outbreak. The foreigners all knew that it was coming and sympathized with us, tho they took no part.

Of course, we expected that the United States would not let the Colombian troops attack us, because of the effect that war there would have in the way of blocking traffic across the Isthmus, but we had no understanding with the Government here, nor are the people of the United States at all responsible for the revolution. It was our own act.

The rising took place ahead of time. Our program was to have it on the 4th inst., but on the 3d, before noon, a gun boat came into the port of Colon and landed about 400 soldiers, as Colombia was well aware of what was stirring and desired to stop it. So we decided to move at once, and just about six o'clock we gave the signal all over

Panama by blowing bugles at the fire houses. This assembled all the people, whose minds had been prepared and who were unanimously with us. We simply overwhelmed the force that Colombia had on the spot and it wisely made no resistance. So the revolution was bloodless and it was all over in two hours. Four of the Colombian Generals, the brothers Tovar and Generals Castro and Amaya, were made prisoners with their entire staffs. They were surrounded as they were about to enter the barracks and saw that resistance would be useless. The Colombian soldiers generally sympathized with the revolution and our people.

There were two Colombian gun boats in port, but the best one, the "Padilla," declared for us, while the other, on her officers seeing the turn that affairs had taken, put out to sea.

We do not anticipate any more trouble. Colombia may feel bitter for a time, but she gained her own independence by revolution and we have the same right. She overreached herself in endeavoring to get more money for the canal privilege than the liberal amount the United States offered, and the world knows how the matter is and has no sympathy. America, Italy and France have recognized us and there is no quarter from which

The Home of Colonel Shaler, General Superintendent of Panama Railroad, Colon

Colombia can expect help. She will have to submit to the inevitable.

We expect that the opening of the canal and its operation by the United States will effect a tremendous change in the status of our country. It will change great world currents of commerce and make the very greatest of all flow by our door, so that Panama, from having been out of the world, will soon be in its main highway. This, of course, means very much to a people who have products to offer, and Panama is emphatically in that position.

Our country is very rich in gold, mercury, copper, iron, salt, gypsum, lime, coal and sulphur, tho these are practically unexploited. Our pearls are the very finest in the world, and we have great quantities of cocoabola and other valuable woods, while our ability to make some things that the world particularly wants is testified to by our celebrated Panama hats.

The area of Panama is 31,921 square miles and its general form is an arc curving from east to west with its convex side toward the north. The State of Cauca is on the southeast and Costa Rica on the west. In its widest parts the distance from sea to sea through the peninsula of Azuero is about 120 miles, but between the Bayano River and the gulf of San Blas the distance is only 30 miles, while following the line of the Panama Railroad the distance across is 47½ miles. On the Caribbean Sea the coast line is about 450 miles long. On the Pacific side the Bay of Panama makes an indentation 110 miles deep and is 122 miles wide at its mouth.

This idea of a canal across the Isthmus

is almost as old as the first settlement. It did not originate with French or Americans, but with Spaniards, as far back as the reign of Philip II, who had a route examined by two Flemish engineers. The proposed line was to have run from the Caribbean Sea to the river Chagres and thence to the Grande, falling into the Pacific Ocean. The King thought well of the project and it probably would have been carried out had not the tremendous struggle to extinguish the revolt in the Netherlands and overthrow England diverted his attention and drained his resources.

General Bolivar took the matter up and had the first formal exploration made in the year 1827, and after that there were many other movements, all apparently abortive.

Everybody could see the great advantage of the proposed canal, but there were also extraordinary difficulties to encounter. So the great waterway is still incomplete.

However, that will not be for long now that the United States will be free to work. The building will soon be completed and the ships of the world traversing the greatest artificial waterway that ever was constructed.

All this will be for the good of Panama as well as of the world at large, and we commissioners have come from the Isthmus with the resolution to do all in our power to expedite matters and make the path of the United States clear, being firmly convinced that our own little republic will be fairly treated. With that conviction we are now going on to Washington.

NEW YORK, NOV. 17, 1903.

Panama Railroad Company's Piers, Colon

The Canal and the Republic of Panama

BY PHILLIPPE BUNAU-VARILLA

[Señor Bunau-Varilla, who has come into such prominence in the United States by his appointment as Minister of the newly created Republic of Panama, is one of the best authorities upon the subject of the Panama Canal, since he is an engineer of international reputation and was associated with the original Panama Company in a very responsible capacity on the Isthmus. Originally in the service of the French Government as civil engineer, he occupied the position which would be considered in this country a Director of Public Works in Tunis and other sections of North Africa under French control. Although in recent years he has resided in France, as intimated in the accompanying article, Señor Varilla has kept in close touch with the situation at Panama, and consequently he speaks with authority upon the canal which at present is of such widespread interest.—EDITOR.]

THE project to connect the Atlantic and Pacific oceans by a waterway across the isthmus between North and South America has been before the world so many years that possibly in the elaborate discussion of the Panama route some features of it may actually have been overlooked. For instance, the fact that extensive operations have been discontinued for such a length of time has given rise to reports that some of the work, to use an Americanism, will have to be done over, and that the canal so far as excavated will require considerable attention, possibly rebuilding in portions, before its dimensions will be sufficient to accommodate the type of craft for which it was intended.

Engineers who are familiar with the topography and climatic conditions which prevail at Panama, however, will, I think, agree with me in the statement that the climate especially is very favorable to the maintenance of such a waterway. This may appear strange when the great amount of humidity is taken into consideration, also the temperature, but it must be remembered that at Panama there is no frost and that the damage which may be caused by extreme heat in connection with extreme cold is entirely averted. Some of the most substantial public works, such as canal retaining

walls and embankments, have been most seriously affected merely from the fact that they were built in a country where they were subjected to the action of the elements in the form of rain and snow and to the freezing of moisture with which they became impregnated, this force of nature affecting them seriously. The very fact that during so many months of the year the temperature at Panama is what Americans consider high, is a point in favor of the

PHILLIPPE BUNAU-VARILLA
Copyright, 1903, by G. G. Bain

canal, as the heat tends to harden the clays which form such an extensive portion of the natural bed of the waterway, so that the formation really becomes harder by the action of time, provided no extraordinary occurrence cause disintegration.

I believe I can safely say that little or no dredging, for example, will be required to deepen the completed canal to the dimensions which were obtained in the original operations, for we have in the Chagres River a friendly rather than an inimical force. The swift current of this stream which passes along the route in such volume at different seasons of the year scours the channel, driving the sand and other sediment before it and forcing this material out to sea. Observations made at the time I was at the Isthmus go to prove this fact, and, as above stated, I question if more than a nominal expense will be encountered in deepening the section which has been considered as finished.

The very obstacles which nature has apparently placed in the way of linking the oceans by this route it seems to me extend a challenge to engineers of to-day which I am glad to say has been taken up by men of international reputation. It is indeed gratifying, for the reason that in the opinion of not a few these obstacles are by no means insurmountable. The fact that engineers noted for conservatism and ability have decided that the project can be executed with the proper installation of machinery and manual labor directed by competent men proves that the conclusions of those who originally studied this problem have not been erroneous as to the ultimate result, no matter how they may have differed in the plans proposed.

Personally, I can say that the canal has been almost a life study to me. During my connection with the original Panama Company I had excellent opportunities to examine the topography of the entire route and to study the natural formation. Then, the Culebra Cut, as it is popularly termed, appeared to be a far greater problem than now, partly for the reason that the development of apparatus suitable for removing this enormous quantity of material was far behind what it is to-day.

Possibly a wrong impression may exist relative to this formation. It is not composed of such an extent of solid rock as has been believed. In fact, if it were more compact its removal might be attended with less expense and less danger, for through the action of the elements the hill or mountain has been so loosened that masses of it crumble into particles at the application of a comparatively small force, and consequently its excavation must be attended with great care. I found it not difficult, however, to evolve a plan by which the work can be performed at a comparatively small expense, and can say that machinery has been invented which can be utilized to great advantage in sections where manual labor was depended upon in the original operations.

I am also pleased to note that engineers who have made examinations of the route in recent years agree with me in the theory that the Chagres can be controlled and not at an enormous expense.

While on the subject of the completion of the canal I may appropriately refer to the assistance which those who are employed upon it in future will have from the electric current, for example. From the time work was begun by the original company until it suspended, steam power was entirely depended upon. The dredges were thus operated as well as the power shovels. Tramways were constructed along the various contracts, each of which represented a railroad system having its equipment of locomotives and cars. It is unnecessary to refer to the large quantity of rolling stock which was thus employed. In the item of fuel for the locomotives and dredges alone an enormous expense was incurred, saying nothing of the pay roll of the numerous engineers and firemen who were required. By the erection of one, possibly two or three power stations, sufficient current can be generated to operate all the train service required, while the dredging and excavating machinery can also use the same force to a large extent. Those who are familiar with the methods of electric distribution in vogue to-day will realize the great economy which can be effected by its substitution for steam. It is entirely practicable, and the current can be transmitted to any

extent desired from one end of the line to the other, since the distance is much shorter than that of many of the transmission lines in successful operation in the United States. The great improvement which has been made in apparatus for piercing rock, such as pneumatic drills, greatly reduces the time and labor required to overcome this obstacle in construction. The building and successful operation of ship canals, both in this country and abroad, prove that the locks which have been projected in connection with the Panama route are entirely possible, but my original theory that the Panama could be eventually a sea level canal will not be counteracted by the construction of the locks, since they can be built in such a manner as to be readily removed when for growth of traffic or other reasons it is decided to reduce the highest level to that of the ocean. The method of construction has already been detailed at length in explanations which I have had the honor of making before commercial organizations and others in this country.

Since severing my connection with the Panama Company as an engineer I have been engaged in various projects, such as the improvement of harbors, the building of railroads, and frequently have been so situated that I could observe the re-

sults attained in undertakings which, to a certain extent, afforded a parallel to the Isthmian canal. This is perhaps one reason why my interest in it has remained unabated, and I may be pardoned for feeling that to have had a part in bringing it to a successful outcome would be the greatest work of my life. This is why I have endeavored to interest not only the French people but Americans in it to the extent of my ability, and it has been a great satisfaction that in this country I have met with so much encouragement from the representative men of the country. The people of the United States have been quick to appreciate the advantages of the canal and the possibility of its construction, since they are not unfamiliar with engineering work of great magnitude.

In the creation of the Panama Republic it seems to me that a long step forward has been taken toward the consummation of the canal, for it is, perhaps, needless to say that the citizens of the country which I have the honor to represent as Minister realize the great advantage which it will be to them as well as to the world, and are almost unanimously in favor of any legitimate course which the United States may take to complete this highway of commerce.

WASHINGTON, D. C.

The Panama Situation

BY SHELBY M. CULLOM

UNITED STATES SENATOR FROM ILLINOIS AND CHAIRMAN OF THE SENATE COMMITTEE ON FOREIGN RELATIONS

[Senator Cullom has consented to the publication of the interview which follows, although it is rarely that he departs from his rule of expressing his opinion on such subjects elsewhere than on the Senate floor. He deals with all the important features of the recognition of the new Government of Panama, as they bear on this country and on the interests of the world.—EDITOR.]

THE Panama canal question is certainly more promising of solution to-day than at any time in the past. It may almost be said to have solved itself in the changes which have taken place; but to imagine that these changes, all or in any part, were inspired or suggested, were anticipated or in the remotest manner foreseen, by this Government, officially, is wholly, absolutely without foundation in fact.

It is equally absurd—preposterous—to say that after the event this Government took steps that were not undeniably demanded and justified by its obvious duty to the world and to American interests in Panama. Had there been no canal interests at stake nothing less could have been done, without inviting censure for dilatoriness; censure that would have been more just at least than the present criticisms.

For months we have been patiently going over the ground of this matter of the canal with Colombia. We have yielded every point that was possible. We have granted every concession that the nation could afford, and supposed that the matter was satisfactorily arranged. When the treaty left us, signed by the Colombian representative, there was every reason to expect its ratification by the Congress of Colombia. But November 2d the Colombian Congress adjourned, and tho no official notice of its rejection of the treaty had been received and no intimation that any other action was contemplated, through ordinary channels it was known that the treaty, already signed by the Colombian representative in Washington, had already been rejected without even consideration by the Congress at Bogota. From recent newspaper reports it appears that while awaiting official notice of the fact the President set about preparing a message to Congress (extracts of which, in its unrevised condition, have already been made public in the press). The tenor and intention of this message (extracts of which have been published) was that all negotiations up to the present had failed; that Colombia had rendered further consideration of the matter impossible, and that we must take such measures as circumstances justified. What these measures should be was wholly a question for further consideration.

But in the meantime Panama seceded and set up a Government of its own. There was practically no effort to quell the insurrection. Colombian troops upon the ground accepted the situation and quietly sailed for home. The Colombian gun boat in the harbor fired a few shots, accidentally killing a Chinaman, and retired.

Having immediate interests upon the spot and immediate duties which must be performed, wholly irrespective of the canal considerations, there was no reason why the United States should not, and every reason why she should, act quickly in insuring those interests against any possible outbreak. The correspondence of the President and Navy Department shows this to have been their endeavor.

When the President was positively assured and convinced that the new repub-

lic was fully established, that there was no immediate action to reduce an insurrection, and no reason why Panama was not and should not be capable of self-government, he did the only thing proper and natural. He responded to the application from the new Government and recognized it, accepting its accredited agent.

The only steps taken by the United States were such as would have been demanded and expedient had there been no canal under consideration. The railroad is a world interest. There are many private American and foreign interests in the Isthmus of Panama, looking directly to the United States for protection. By the treaty of 1846 the United States assumed the right and responsibility to protect the transit across the Isthmus, and the world has always looked to us to perform this duty properly.

In the present instance steps must be and were taken, immediately, to protect those interests. Immediate action to preserve peace was imperative, and those who know the locality in question and have examined the correspondence on the subject, recently made public, know that nothing beyond this was proposed or attempted. The United States did precisely as she has done before when it chanced to be in the interests of Colombia, and Colombia was accordingly grateful. It is absurd to say, because there are at present other questions at stake which may arrive at solution through the changed conditions, that therefore in this case our Government had sinister motives.

As a matter of fact, it was undoubtedly the question of the canal, the money and the local advantage to be derived by Panama which brought about this insurrection, but that is an incentive which applies to Panama alone. Colombia, aside from the district of Panama, would receive very much less benefit through the canal than would Panama; Colombia's individual interests centered largely in the price to be paid. Panama, on the contrary, was vitally interested in the canal. A great world's waterway must of necessity prove of incalculable advantage to her in many ways. It amounted to almost a death blow when Colombia rejected the treaty and her Congress adjourned November 2d. The protest was

immediate and spontaneous on the part of Panama.

The people of the Isthmus had what they considered good and sufficient cause for declaring their independence. But they were undoubtedly incited to the act through fear of losing the canal. Colombia might easily have foreseen it; it was plainly inevitable. It is not that President Roosevelt was too quick. He simply did his bounden duty and did it promptly. It is emphatically true, however, that President Marroquin, of Colombia, was too slow. He knew of the violent sentiments of the people of the Isthmus over the rejection of the treaty. He understood the situation, and must have foreseen the possibility of a revolution if the American treaty was rejected.

Panama claims that she gained nothing by community of interests with Colombia, and being now in danger of losing everything she might have gained through the advantages to be derived from the canal, she takes this time to declare her independence, consistently with her original alliance with Colombia, in order thereby to be in a position to secure those advantages. She had a perfect right to do so. She has done so, and established what has every appearance of being a permanent Government.

No one who has any conception of the facts and any knowledge of international law would deny for an instant that there exists to-day a Government at Panama which is perfectly capable of transacting business, making treaties and granting concessions, and that her representatives, duly and fully accredited, would have all of the customary authority. Minister Bunau-Varilla, the representative already in Washington, is fully empowered to accomplish all treaty negotiations, preparing the way for a settlement of the canal question at once and forever. Those who claim that the President is acting too much in haste should consider why it is that he is now patiently waiting the arrival of other commissioners, reported to be on the way, instead of proceeding at once as he might. The fact is that Panama *is* in haste. Panama has great interests at stake for both the present and the future. Panama wants the canal. Quite probably she entered into this insurrection with the immediate object of

the canal in view, as the first step of her independence. And it is not surprising that when the Government was established she turned her attention at once to that immediate object.

Whether the insurrection was planned in New York by her representatives there or in Colon, as an alternative if Colombia rejected the treaty, is of no moment beyond Panama. The Declaration of Independence was inspired by the situation. The canal offers Panama such an opportunity as can never occur again or by any possibility be equaled. Panama needed no instigation from outside. She only needed common sense.

Panama is in haste, and all that has been done to expedite matters thus far has been efforts on the part of Panama to facilitate the accomplishment of the end which she has naturally most in view.

A Minister—Bunau-Varilla—was appointed to the United States with full credentials, and upon presenting them to the President he was received by him as the Constitution makes it the duty of the President to receive ambassadors and other public ministers. No representative has been sent to other Powers as yet. In fact, Minister Bunau-Varilla is authorized to effect the recognition of Panama by the other Powers through their representatives at Washington, and there is every reason to believe that this will be accomplished soon.

From some of the criticisms of the course of this Government one might be tempted to ask if the people of the United States really want a canal. The general impression has been that they do. The general feeling has seemed to be that it was the duty of the Administration to make every reasonable effort to secure the construction of a canal.

If that is the case, and, after long negotiations which nearly failed, a change presents the desired opportunity to proceed, what should be said if the Government were to delay action? Why should it not accept the incidents which have rendered further negotiations possible and proceed at once, always keeping before us the honor of the United States? If it had failed to proceed at once, it might well have been charged with unjustifiable negligence, instead of undue haste.

The present position as it presents itself is that the fully accredited representatives of a legitimate Government controlling the course of the proposed canal are now in Washington for the purpose of arranging a treaty to accomplish that which the people of the United States and foreign countries have long been expecting this Government to accomplish, as a great and most desirable benefit to the world.

There is no doubt but that the people of Colombia are more or less in a state of excitement and disappointment. It is natural that they should be. But, except where through ignorance and false report their anger is turned on Americans,

it is probably directed chiefly against their own Congress, which is alone responsible. There has been nothing in the course of the United States to justify the anger of Colombia against us, and obviously this Government cannot possibly have any further dealings with Colombia concerning the canal. Colombia repudiated the matter before she lost control of the Isthmus. This Administration must deal with the owners of the property. Colombia forfeited the opportunity; Panama availed herself of it. And if the President does as has been expected of him heretofore he will proceed and carry out the canal negotiations with Panama.

WASHINGTON, D. C.

The Story of a Modern Voyage, or "Across Lots" to China

BY JAMES H. WILLIAMS

[The author of the following article our readers will remember as the sailor who has done more for the abolishing of the "crimping system" than any one else in the United States. Mr. Williams has followed the sea ever since 1876, when he was a boy eleven years old, except for a period of years between 1894 and 1900, when he remained ashore and helped organize and build up the Atlantic Coast Seaman's Union. Two years ago, however, he returned to his old occupation, and the following article is a description from the sailor's standpoint of his last voyage. He is a "common sailor," and we print it exactly as he penned it.—EDITOR.]

I CANNOT claim that the "Besant" was my choice, for I was not the architect of my own fortunes at the time. The deep water sailor, as a rule, has no more to do with the selection of his ship than with the selection of his parents. His ship is his fortune, that's all. As a general thing in such matters, the sailor proposes and the crimp disposes. For the crimp controls both the sailor and the ship, and neither is free to depart without his sanction. I had often run the "Easting" down, and weathered Cape Horn on my errands to the Orient and back. But I had never passed through the Suez Canal, nor served in an ocean steamship. Hence my eagerness to join the "Besant" and go out via de Lesseps Lane. As luck would have it, this

time my intention was to be gratified in regard to both ship and voyage; so I obediently signed away my first month's wages to the crimp and my personal liberty for the next two years, more or less with a clumsy flourish and a smile of resignation.

On the following morning I was conducted on board with the other unfortunates, under convoy of the usual force of crimps and jackals, and duly turned over to my new proprietor, the skipper.

We were soon mustered along the starboard rail, carefully counted like a herd of steers, and gruffly ordered to "go for'ard and stand by."

As soon as the crimps had secured the captain's indorsement to our advance notes, they climbed nimbly over the ship's

side to *terra firma*, and left us to our fate. Our shore fasts were then cast off, and the ship dropped out to an anchorage in the stream, to forestall any lurking inclination on our part to desert, before our "dead horse," or price, per head had been worked up.

"Blue Peter" was now lowered from the fore truck to the cap, to indicate immediate sailing, and those of us who were sufficiently recovered from our boarding house debauch were turned to work, while waiting for a pilot. We soon had our decks cleared up, our mooring chains and hawsers stowed below, hatches battened, and everything shipshape and ready for sea.

As soon as our pilot arrived we proceeded to "get under way." Getting under way in a steamer is a much simpler operation than the term implies on a sailing ship. You miss the flapping of suddenly loosened sails, the rattling of chain sheets and brace blocks, the excited bawling of cranky officers on deck, and the quick, cheery responses of clambering sailors aloft.

There is no backing of yards or head sails to "get her off the wind," no ringing chorus on the windlass brakes or fish tackle fall as we get our anchor, no rousing chanties as we mast head our topsails, and no farewell song as we haul in our hawser. Everything seems automatic, prosaic, unnatural. As the steam windlass rumbles in the anchor chain, the stokers stir their fires; the smoke pours from the big funnel in a heavy black column; the engineers stand by their shining levers, and the able seamen stand by in dumb amazement at the whole proceeding.

"Anchor's apeak, sir!" bellows our chief mate from the fore-castle head. "Break her out, sir!" comes the surly response from the bridge. The windlass struggles again for a few moments with the clanking chain, and the ship's head surges upward perceptibly as the steadfast anchor lets go of America, and we are off for China, ten minutes after "whistle blow."

By dusk we had left Norfolk far behind and were well out to sea, with Cape Henry, dimly visible astern, pointing like a long, white finger to direct our course, and its tall lighthouse sends us a farewell gleam.

The "Besant" is one of those huge, ungainly freighters commonly known as "ocean tramps." She is of about 3,000 tons register, and capable of carrying about 6,000 tons of dead weight cargo. She flies the British flag and hails from Liverpool.

A tramp steamship is built on strictly business lines, and amply justifies the faith of her projectors. There is nothing graceful in her design or artistic in her appearance. But altho she may lack the beauty and elegance of the towering wind jammer, or the faultless lines and rakish sheer of the majestic "greyhound," she is, nevertheless, the ideal of scrupulous economy and practical utility, as applied to maritime ventures, and is justly entitled to distinction as the camel of the seas.

The stage coach era of the world has passed, and the great fleets of sturdy tramps encircling the globe in their constant quest of cargo constitute the over-sea freight trains of to-day.

The application of steam power to shipping has rendered the earth's surface more snug and compact than it was, and brought the nations thereof into closer relationship with each other.

That brainy old navigator, Mercator, made a literal and lasting demonstration of the seeming paradox, that the longest way around was the shortest way to India. But de Lesseps has actually shortened the distance to the Orient one-half with the aid of steam.

The United States is, without doubt, the greatest buying and selling nation of the world to-day, and England is the greatest carrying nation. American goods, ranging from clothes pegs to locomotives, and from pin cushions to parlor couches, are carried all over the world in British ships, because we have none of our own. As a people we find it cheaper to employ foreign ships for the distribution of our wares than to operate fleets of our own, just as the individual often finds it cheaper to hire a cab than to keep a horse.

Thus it is our once proud merchant marine has been gradually permitted to "rot in its own neglected brine," while the fleets of foreigners, notably the British, are allowed to earn rich dividends by trading on our necessities. And the American youth with a taste for adven-

ture is left to take his choice between serving on a foreign ship or "braking" on a freight train.

But this is to be a story, not a marlin spike job, and an old sailor, such as I have been, making a long traverse, must get back to proper bearings at once.

There was no trashy gingerbread work or useless adornment about the "Besant." Every detail of her construction is marked by the austere consistency of business economy. She has a stern like a cheese knife, a sheer like an Erie canal boat, and a bridge superstructure about as elegant as a top-heavy omnibus. Nearly everything on board, except the flag, is made of iron. Even her decks are laid with broad, rolled plates of that material, or, as my messmate, Spike Riley, called them, "iron planks."

On a well ordered ship a sailor's hands are never allowed to get rusty from idleness. The "Besant" was no exception to this rule, and when our chief mate could not find work for us he generally made some. Our chief employment on the passage out was to soogi moogi the paint off and then put it back again. The tools of our trade were a soogi wad and a paint brush.

On the sixth day out one of our tiller chains parted, but was soon repaired, and we proceeded sturdily on our way. The only other accidents during the voyage were two broken arms and a broken head. These have not been repaired yet.

Our first land fall was one of the Azores, Fayal, I should judge, from whence we shaped our course for Cape St. Vincent. From this point we made for the straits, passing almost within hailing distance of the Rock of Gibraltar, rising like a mighty sentinel with a challenge from the eternal sea. Early on the sixteenth day of our voyage we arrived off the harbor of Algiers. We soon took a pilot and went in, for here we were to replenish our now nearly exhausted bunkers with steaming coal. We had made a fairly good passage to Algiers, but inasmuch as most of our bunker space had been crowded with cargo to enhance our owner's gains we arrived with actually less than one day's supply of steaming coal on hand.

We were lucky this time, so the question of good business management does

not arise here. But the sailor who would go to sea, as he would to church, without sea boots and oil skins, would be a fool and his shipmates would call him so.

The most impressive thing about Algiers is the intensely artificial appearance of the water front. The harbor itself is formed by artificial breakwaters running in juxtaposition to each other, and built of artificial stone. A narrow passage between them, like a hole in the wall, serves for the passage of vessels.

The houses ashore, too, seem to be mostly of artificial stone, and all built on the same plan. Except for a small clump of trees near its center, the built up sameness of the water front is most oppressive. To the wealthy tourist, in search of health or pleasure, Algiers may be all right. But to the itinerant sailor in search of coal it is only a pocket.

Leaving Algiers with full bunkers, we proceeded through the bright, tranquil waters of the Mediterranean to the gateway of morning, Port Said. We passed the colossal statue of Ferdinand de Lesseps, which marks the entrance to the canal. Just as the dawn of a glorious May day was touching the reflective pinnacles of the great light tower and stately canal building with its rosy glow, and spreading like a heavenly benediction over the dreary desert, we were soon surrounded by a fleet of lighters containing a new supply of coal, which was transferred to our bunkers with commendable dispatch by an energetic horde of dirty Arabs with their hand baskets. By three P.M. our coaling was finished, and we at once prepared for our passage through the canal. As most of the passage was to be made at night, a powerful electric light generator had been previously taken on board, for the "Besant" carries no search light. The light was hoisted to a stationary position at the stern, and the generator was placed on the main deck and operated by steam supplied from the ship's boilers. This apparatus was in charge of two French electricians, who came on board for the purpose.

When all was complete, the French pilot took his station on the bridge and gave the order to let go. We started off slowly at "dead slow ahead" across the basin at the head of the ditch. A few

short turns brought our ship's head directly between the lines of red and black-and-white buoys which mark the channel edge on either side. Then we started off at five knots speed, which is the regulation gait through de Lesseps Lane. The general direction of the canal, from Port Said to Suez, is about southwest, and the route is fairly straight and even all the way. The Suez Canal has been too much written about to need more than passing mention from a novice like me. It is certainly a credit to our generation, and well worth going to see.

Emerging from the southern terminus of the canal early in the forenoon, we anchored long enough to discharge our pilot and electricians with their apparatus, and then proceeded on our journey down the Red Sea.

Our next destination was Singapore, at the end of the Malay peninsula, some four thousand miles away. For six days we proceeded to the southeastward through the Red Sea, now catching distant glimpses of the African coast, and again surveying the bald, arid tops of the desert islands in our track, as parched and forsaken as the great desert.

Across the bright, gleaming waters of the Arabian Sea we enjoyed delightful weather, and the glorious phenomena of sunrise and sunset were beautiful in the extreme. Of all heathen superstitions, sun worship is perhaps the most justifiable. Onward, across the Indian Ocean, we pursued our way, with nothing more remarkable to disturb the monotony of our lives than the sight of an occasional fellow tramp. The sudden appearance of a patriarch whale, grunting and blowing in rich content as he rolled lazily in the luxuriant brine, or a school of startled flying fish, darting like silver winged arrows through the air to escape the eager jaws of beautiful but voracious dolphins.

We skirted the shores of fragrant Ceylon for some hours, enjoying the spicy breezes. Then, taking a new departure from Point de Gaul, we shaped our course for the Molacca Pass. Reaching, in due season, the entrance to the Pass, a further run of three days brought us to its southern terminus, and one pleasant Sunday morning we issued from between the verdant heights at the end of the peninsula, when the flourishing

city of Singapore burst suddenly upon our vision like a dream of the Arabian Nights. Here our misery commenced with our three months' itinerary of the coast of Asia.

At Singapore we discharged the first consignment of our general cargo, and loaded 1,000 tons of teak and green heart timber, destined for Shanghai. We lay three days at Singapore and were not sorry to depart for the north, for Singapore is rather too near the sun for comfort. Our passage across the China Sea occupied ten days, and we arrived at Shanghai on June 7, exactly two months out from Norfolk.

On the same day the big American ship, "Roanoke," arrived, precisely six months out from New York, via the Cape of Good Hope. A wonderful comparison! At Shanghai we lay five days discharging cargo, and then continued north to Chifuh, where we were to deliver 3,000 tons of Pocahontas coal for the United States Navy. We found eleven of Uncle Sam's war ships assembled at Chifuh to receive us, the largest and most imposing squadron I had ever seen under the Stars and Stripes on the Asiatic station. Prominent among them were the famous battle ships "Oregon" and "Kentucky," the converted gun boat, "San Juan de Austrias," captured at Manila Bay, and the splendid cruiser, "New Orleans," which we purchased in her cradle from Brazil. Chifuh has a fine harbor, but the town itself is hardly worth mentioning. It is chiefly remarkable for beggars and bad odors. The houses in the native district are poorly built, and the streets run in almost any direction except the way you want to go. The miserable natives are unbearably filthy, but fairly industrious. They are all right if you keep far enough to windward. Those employed in discharging our ship received 20 cents per day in Chinese money and one ration. The daily ration consisted of a small rootee (loaf) and a large radish per man. The European section of Chifuh is well built and finely situated, and the surrounding scenery is rugged and grand. But I had no time for sight seeing. Hard work, harder fare and long hours were the order of existence. Time is money to everybody in this world except sailors.

As soon as the last shovelful of our coal had been discharged, we hove up our anchor and left for Moji, Japan. Each of the assembled war ships in turn dipped to our colors as we passed out.

Another tramp of three days and we were on the coast of Japan. The islands there are indescribably lovely. They are among nature's earthly masterpieces. Go out and see them. Our business at Moji was to recoal, and with the splashing of our anchor we were surrounded by sampans, crowded with natives of both sexes, all eager for a job. For at Moji the women and girls cheerfully assist in the delicate occupation of coaling ship. In many cases little droll, brown babies sleep contentedly on their mother's backs at the same time. At other times these babies stare inquisitively about in infantile amazement with all the eyes in their queer little heads.

The Japs are eager, intelligent workers and most amiable people. Their new status as a civilized nation is only observable in the attempts of the upper classes to ape Western manners and attire. The result is usually a comical farce, for a Jap is born to wear a kimona and a broad smile; nothing else becomes him.

Our coaling finished at Moji, we proceeded on the same day to Kobe, about thirty hours distant. After stopping two days at Kobe, we crossed the inland sea to Yokohama, where we remained six days and spent a dismal Fourth of July. At Yokohama the last of our outward cargo was discharged, and we received the first consignment of our journey home. Returning to Kobe, we picked up a thousand tons for New York account and a quantity of very heavy timber for the dry docks at Shanghai, for an ocean tramp is everybody's porter. At Moji we coaled again, and, in addition, loaded 1,500 tons of coal destined for Shanghai. On returning to Shanghai we remained 15 days, loading and discharging cargo.

By this time the effects of "business economy" began to make itself felt, and most of our crew became sick. It was during the height of the dangerous and deleterious rainy season, when jungle fever and plague abound all along the coast. Yet the ship carried no accommodations for our comfort or safety, or food

fit for human consumption. On the passage out we had been fed on the regulation diet of old hog, old horse and hardtack, sanctioned by the British Government to be served out to its seamen. The shiny black wevils and big fat grubs which inhabited those hardtacks were certainly a credit to their country, and the odor of the beef and pork had not improved with age. At Singapore, however, these delicacies were stopped, to save them for the passage home. For the next three months we were fed on what is known as a "coasting diet," that would have been a revelation even to the Ancient Mariner.

Our hours of labor were from 6 A.M. to 6 P.M., with an intermission of three-quarters of an hour for breakfast and another of one hour for dinner. Supper never happened.

The victualing department was presided over by two heathen grub spoilers, who, according to Spike Riley, could not boil water without burning it. For breakfast we were invariably presented with boot leg coffee and a pan of rotten potatoes, boiled in dirty water, and stamped on, skins and all. This delicious confection was religiously handed out to us from the galley door each morning at 8 o'clock, with the cheerful announcement, "Scouse!" and just as religiously dumped into the waste chute, with a solemn imprecation and the muttered comment, "Garbage!"

The "fresh junk" for our dinner was always hacked from the neck or shoulder section of a grossly overworked bullock, just at the spot where the yoke had done the most good.

The Chinese method of preparing this morsel is to set it on to boil at about 7 A.M. and then forget it until dinner time. The boilings passed for soup in the galley, tho they usually passed over the side elsewhere. Spike Riley claimed that he could read a newspaper through a fathom of it.

No supper is allowed on an English ship. At six o'clock in the evening a mysterious concoction is served out under the name of tea—a most infamous libel on the fragrant herb. We called it "water betwitched and tea be ———"—well, "tea be blowed." After disposing of this treat we sought repose for our weary

bones under the awning; but the nightly downpours of rain usually drove us all into our stifling fore-castle before morning, to swelter the night away among swarms of mosquitoes. Our fore-castle was ventilated by three small bullseyes and a small funnel, which the ship builder somehow forgot to leave out.

Under such conditions it was natural to expect sickness, and jungle fever and dysentery soon became epidemic throughout the ship. In vain the port sawbones dosed us with various kinds of "belly wash." In vain did the ship's officers haze us for a lazy lot of "soldiers" because we could not work. The spirit indeed was willing, but the flesh was weak. Our skipper, affectionately known as the "Old Man," was a big, pompous, well fed old tyrant, with his heart in his owner's pocketbook. The only attention he paid to our repeated appeals for better food was to threaten us with all manner of penalties for refusing to work, and to point a big, brutal finger at the scale of provisions to show that we were getting more than our whack, and would "get na mair." According to British law, his position was the correct one; so we had nothing left us but the sailor's unchallenged privilege to growl. "Old sailor, old growl," is a nautical truism founded on an intimate acquaintance with the man Jack. And "growl you may but go you must" is the *ipse dixit* of his whole career.

On our way down the coast the half starved firemen were unable to keep up steam, and our speed slackened nearly one-half. The engineers cursed the stokers for loafing, the skipper cursed the engineers for skimping, the mates cursed the sailors for anything, and the sailors cursed them all for everything.

Thus we limped into Fuhchau and continued to load. Fuhchau is a most interesting place and boasts a big pagoda. I went up to pay my respects to the gods. These images reveal more than anything else the monstrous superstition of the Chinese mind. If their features can be taken as earnest of their benevolent intentions hereafter, I surely don't envy John Chinaman his happiness in the Kingdom Come.

While lying at Kelung, in the island of Formosa, we were struck by one of

those mighty periodical tempests, a typhoon, which lasted for sixteen hours and threatened to tear away the very mountains themselves. We rode it out safely, however, thanks to the sturdy disciple of old Tubal Cain who forged our anchor chains.

After calling at Amoy we went to Hong Kong. Here the condition of the crew became so bad that the port doctor intimated to the Old Man that we were likely to be quarantined on arriving back at Singapore, which was to be our next and last loading port. This hint touched the right spot, his owner's pocket and his own skin.

Our Chinese pot wrestlers were gotten rid of and two good cooks secured, and new and fresh provisions, and even fruits, were brought on board and served to us with surprising regularity.

The effect was magical, and by the time we reached Singapore all hands were so much improved that we were given a clean bill of health and permitted to land and load.

At Singapore all hands were stripped and carefully examined for plague spots, but none were found. Spike Riley told the doctor not to be alarmed, as microbes couldn't live on us.

On the passage out our American cargo had consisted principally of manufactured goods, chiefly railroad material and machinery, tools, sewing machines, refined oils, etc. Our homeward cargo consisted largely of raw materials, such as hides, skins, bristles, pig tin, gumbia. We had also tea and silks, bamboo, rattan, coffee, sago, canned pineapples, curios, etc., and a general cargo of Oriental knickknacks.

At Singapore we battened our hatches for the time, either for New York or Hereafter.

On August 27th we sailed on our return voyage, precisely three months from the day we left Singapore for Shanghai.

Who shall estimate the value of our voyage? When we get home we can tell you of wonderful deeds done in this ship. We will boast that we have traversed and retraversed a path far longer than the circumference of the globe, and that we have transported and distributed 15,000 tons of the world's best merchandise among fifteen different ports on our way.

And that all this mighty task has been performed within a period of seven months. And all by one ship with a crew of thirty-six men.

Shades of Mercator and the "Flying Dutchman," what an age this is!

Our homeward passage across the Indian Ocean was retarded by the strong westerly monsoon winds, which were now in season. And we had to call at Perim for coal. The only incident on our passage across was when we were overhauled in mid-ocean by the big, fast tea steamer, "Tydeus," doing her 16 knots to our 10. We signaled as she passed us, and learned that she was bound for England with a cargo. I think her tea must have been consigned to Sir Thomas Lipton, for she signaled the cheerful information that the "Reliance" had won all three of the International Yacht races. Spike Riley observed that the "Shamrock" must be green with envy.

Retracing through the Red Sea and the canal, we left Port Said in the dusk of one day, just as we had entered it in the dawn of another. So our Gateway of Morning became our Gateway of Evening. And then we are lying at Algiers once more, and as these last lines are penned, at midnight, the Arab coal passers are again at work filling our bunkers. In three more weeks our labors will be over and our cargo will be delivered at your doors. Our labors will insure happiness to many, and work and wages to

many more. Thousands will benefit by our sacrifices and sufferings. We have material for the workers, teas for the gossips, and curios for the curious. while the rich silks below our hatches will arrive in time to adorn the figures and set off the charms of Christmas *débutantes* and blushing New Year's brides. Yet few of these, I fear, will spare a passing thought for the weather-beaten sailors and grimy stokers who have contributed so much to their happiness and social success.

Dear reader, my only apology for the infliction of this tale is that I am a marlin spike artist, instead of an author, and did not know any better. "If it were not so, I should have told you." Would to God it were not. Condemn the story if you will, doubt it if you wish, but please read it first and keep it in mind.

If you ever grow tired of traveling first-class on ocean liners and wish to try a cheaper method, just ship before the mast on the "Besant" and go cross lots to China, like me. Then you will find there are no fringes around the hawser pipes, and that a spy glass has two ends. Should you live to get back alive, I have no doubt the editor will be glad to file any complaints you may have to make for future reference, provided they are carefully written on one side of the paper, properly punctuated and accompanied by your annual subscription to THE INDEPENDENT, as an evidence of good faith.

This, Wind or drenching Rain hath done:
Each perfecting the Sculptor's plan
Upon the godlike image—Man.

ST. CHARLES' COLLEGE, ELLICOTT CITY, MD.

Lou Dillon

BY MILLARD F. SANDERS

[THE INDEPENDENT representative who procured this interview from Mr. Sanders, the driver of Lou Dillon in all her victories, was introduced to the Queen herself. The carpet of her large stall was a foot thick, ingeniously made of rye straw, as one of the Queen of the Turf's eccentricities is to eat carpets if made of anything she considers edible. All around this room blankets bearing the Billings monogram hung like tapestry, keeping out drafts. Nothing could be kinder or more courteous and gracious than the way in which the visitor was received by Lou. She allowed him to rub her nose and forehead, and listened with an almost human interest to what he had to say.—EDITOR.]

LOU DILLON, the swiftest trotter that the world has ever seen, who recently went a mile in 1.58½, is now in this city, residing in Lee's Stables at the upper end of the Speedway. She is only here for a little while setting the horse world agog, because her owner, Mr. C. K. G. Billings, has so many particular friends in New York and, of course, they all wanted to see and congratulate Lou at the end of the most wonderful season that any horse ever enjoyed. But having given this treat to her admirers, she will go Southwest to Memphis, and perhaps even to the scene of her early days, the Santa Rosa Stock Farm in California, where she can meet her mother, and all her human and equine companions who knew her before she became famous.

In the glorious climate of California horses can roam the fields all the year round, with the exception of about two weeks, when the rains are bad; and Lou, clad only in the garment that nature made for her, will renew the free and happy life which was hers before she ever knew harness. With troops of friends she can wander about, sipping the clear spring water or cropping the fresh grass; she can prance, gallop or roll on the soft turf, and she undoubtedly will do all these things and many more, because after all Lou is still a colt—only five years old—and has all a colt's love of fun and frolic.

But whatever she does will be right, for Lou is as kind and gentle as she is beautiful and great. She is very feminine. She has pride, but it is a gracious pride. She is notional, but her notions are pretty; she wants to do things her own way, but then her own way is just the right way for her.

Lou, in her races, comes to the start-

ing point with a hop, skip and a jump, a little dance, a little gallop; all wrong from the orthodox point of view, but all right for Lou Dillon. In another horse such conduct would be most reprehensible, and would presage badly for steadiness in the race, but in Lou's case all the frisking is a mere harmless effervescence. She is so high strung, so eager, so full of strength and go and joyous life that she simply can't hold herself; she must dance and prance.

But once in the race no horse ever went truer than Lou. The word "driver," tho the proper technical term, conveys a false idea concerning the person who sits behind Lou in her races. She isn't really driven at all. She knows nothing of the whip and little of the bit. She is given her own way, with the reins slack on her back and the man behind simply giving a word of advice at critical points as the magnificent dark chestnut creature, with the white star on her forehead, the white snip on her nose, the white stocking on her left hind foot and the Titian red gleams in her long silky mane and tail, spurns the earth and flies around the track faster than ever trotter went before.

The Santa Rosa Stock Farm, where Lou was born and to which she may return for the winter, is a very beautiful place on high land near the town of Santa Rosa, and overlooking the Pacific Ocean. It is devoted to the breeding and rearing of trotters, and here, amid groves and fields, the horses live outdoors, the free, wild, natural life of their remote ancestors, before horses ever knew men, caring for themselves in all things and at all times, except during the brief rainy period, when the men shelter them in humble wooden

buildings with dirt floors, which do not offend the hoofs.

Lou's father was Sidney Dillon, and her mother Lou Milton, so at her christening she took one name from each of her parents, thus becoming Lou Dillon.

longed to one of the very best equine families, and whose memory is still green in the Far West.

There is a bit of a mystery concerning some part of Lou Dillon's family tree, and since her sudden and tremendous

From Photograph loaned by "The Horse Review."

Lou Dillon Driven by Millard F. Sanders

If she had been of the other sex she would probably have been christened Sidney Milton.

Lou's father is a compactly built chestnut stallion, 15 hands 2 inches in height, and weighing in his prime 1,125 pounds. He has a remarkably good trotting action, and has gone a mile in 2.16 over the farm track at Santa Rosa, tho he never was given a record.

Lou Milton, who is still on the Santa Rosa Stock Farm, is now turned twenty years of age. She was, at the time when her great daughter came into the world, a very good looking bay mare of artistocratic appearance. She was fine, clean cut, high strung, and had about her all the indications of a thoroughbred. Her father was Milton Medium, son of Happy Medium, who be-

rise in the world equine genealogists have been very busy investigating it. So learned are they and so thorough and painstaking have been their researches that there is no doubt but that, in spite of the fact that California records of twenty years ago were painfully neglectful in regard to horse genealogies, Lou's ancestry will be traced.

On this Santa Rosa farm, then, amid the groves and fields, all in the balmy clime of California, Lou Dillon was born of aristocratic parents five years ago, and here it was that she grew up a gay young aristocrat, reveling in all the delights of the place. As she matured it was easily perceived that she had great speed possibilities, but at the same time sober sided people shook their heads over her. She was so high strung that they thought she

was overstrung, too nervous, too notional, too frivolous, too wayward to ever amount to anything.

When harness was first put upon her she showed nervousness and impatience, and she wanted her own way. The farm trainer, a very experienced man, but a stickler for orthodoxy, insisted on her doing things as other horses did them. Mildly but firmly she refused, and when he still persisted, they quarrelled. Lou has a very sweet disposition; she never harbors a vicious thought, she is generous and gentle, yet most brave and full of fire, and so it is possible to force a quarrel with her.

So whenever she was taken out by the farm trainer there were painful scenes of discord, and the sober sided people shook their heads more and more.

Three years ago, when I returned to

saw. She took to me, too, and from that day to this, tho I have driven her in all her miles, we have never had a quarrel.

She needed understanding, trust and sympathy, for, as I have said, she is very feminine. There never was a safer horse, but she is most ambitious, wanting to go all the time.

As acquaintance with Lou ripened I became more and more convinced that she was worthy of the Higher Education, and so the following season I brought her with my stable on the grand circuit, which includes the tracks at Cleveland, Detroit, Buffalo, Boston, New York, Lexington, Cincinnati, etc. This is an opportunity that very few young horses get, and it is most improving. After a time a horse becomes tired of racing on the same track against the same competitors. It feels the monotony just as a man would. I am

LOU DILLON

the Santa Rosa farm for the winter season, I found Lou in disgrace on account of what was supposed to be invincible frivolity. I made her acquaintance and liked her at once. She has the daintiest and nicest manners of any horse I ever

sure that wild animals that are caged suffer from this purely mental effect in the same way, and that the reason so many of them sicken and die is that all interest and excitement have been taken out of their lives. They have nothing to look at

and nothing to do, and they are simply bored to death.

On the grand circuit there is constant change and excitement, and Lou Dillon tried all sorts of tracks and had brushes with all sorts of rivals, and all the time she was gaining in experience and confidence. She had all the benefits of racing and none of the strain. On the Cleveland track we trotted her in brief brushes against Anzella, who has done a mile in 2.06 $\frac{3}{4}$; Dolly Dillon, 2.07, and Sir Albert S., 2.03 $\frac{3}{4}$. The opinion that she had great speed was confirmed, and her education was continued with increasing hope. Last year at Memphis I allowed her to go a mile in 2.08 $\frac{1}{2}$, the last half being covered in 1.01 $\frac{1}{4}$, which was remarkable work for a four-year-old. That ended the season, and I shipped Lou back to California with the rest of the stable.

During last winter one of the owners of the Santa Rosa farm, Mr. Henry Pierce, died, and Lou Dillon had to be sold in order to settle the estate. On May 12th of this year she was shipped to Cleveland and sold to Mr. Billings for \$12,500—a regular gift.

Early in the season she began to do remarkably well and, constantly improving, surprised us on every occasion when we asked her to do anything. The true wonder of her performances is not seen unless one takes into consideration the fact that she is still a little green mare.

So we set her to racing, and she soon had all the people who love horses amazed.

At Cleveland on July 16th she beat the world's amateur record to wagon, 2.06 $\frac{1}{2}$; a little later, on the same track, she beat the world's record to wagon, covering the mile in 2.04 $\frac{3}{4}$. On the same track on July 4th she had trotted a mile to sulky in 2.04 $\frac{1}{4}$, and a little later made a new world's record for mares, 2.03 $\frac{1}{2}$. She wound up the Cleveland campaign by trotting another mile in 2.02 $\frac{3}{4}$, tying Cresceus. At Brighton Beach she trotted in 2.03 $\frac{3}{4}$.

These were all great performances, but the Queen was only beginning to show what she could do. At Readville, Boston, on August 24th, she went a mile in two minutes. No matter what comes after her, she will be remembered for that performance as long as the world stands. No

matter how fast other horses may go, they can never wipe out the fact that she was the very first to do a two minute mile.

That performance put Lou in a class by herself immediately. All the world of horsemen had for years been discussing the possibility of the two minute trotter, and many were sure that such a horse would never appear. And here was Lou Dillon, who had made the time.

At Cleveland, a week or two later, attached to a high wheeled sulky, she went a mile in 2.05, easily beating Maud S.'s time, 2.08 $\frac{3}{4}$, which for eighteen years had stood as the world's record.

At Lexington the famous Major Delmar made a new world's record of 2.03 $\frac{3}{4}$, trotting to wagon. This record was broken in the shortest time ever known, for fifteen minutes after Major Delmar made it Lou Dillon came on the track driven by her owner, Mr. Billings, and did the mile in 2.01 $\frac{3}{4}$.

At Memphis, about October 21st, she again met Major Delmar. By this time each had done a mile in two minutes, and this was the first time in the history of the world that two 2 minute trotters ever competed. Lou won handily in the fastest heats ever seen: 2.04 $\frac{3}{4}$, 2.04 $\frac{3}{4}$.

A few days later, about October 25th, Lou surprised the world by trotting a full mile in 1.58 $\frac{1}{2}$. Her last appearance on the race track was to a wagon, with Mr. Billings driving, when she started to beat her own world's record of 2.01 $\frac{3}{4}$ to wagon. She again surprised us by trotting the mile in two minutes flat, thus establishing another record for herself.

So Lou ended the season in a blaze of glory, and she came out absolutely sound and fresh. She proved to us that there never was a faster, gamer, steadier or more reliable trotter, and I feel sure that her best days are yet to come. I expect to see her beat even the pacing horse record. She has pacing horse speed and the strongest heart of any horse I ever saw.

As an instance of her courage and steadiness, I may mention that the first automobile she ever saw was on the road at Cleveland during her first season away from the farm. The machine came at us making a deal of noise, but Lou only looked at it, pricking her ears. The automobile stopped and began letting off steam. Yet at my request she

walked up to and examined the strange thing with curiosity, but without fear, while the automobilist took her picture.

One advantage that Lou has over most horses arises largely from the fact that in spite of her dainty airs and graces she is so gentle and so true. We can give her the utmost freedom. She wears no checkrein or martingale. Her head is not forced away up like the heads of other horses, and she goes easy to herself, with the reins slack on her back. Then, again, her legs are not swathed like those of other horses. She wears only a light pair of shin boots and a very light pair of quarter boots, and her shoes are the lightest ever worn by a fast trotter; her front shoes weighing $4\frac{1}{4}$ ounces each and hind shoes $2\frac{1}{2}$ ounces each.

Lou, who has her own personal attendants, to whom she is much attached, sleeps soundly in blankets till 6.30 o'clock every morning, and then gets up and has breakfast, which consists of $2\frac{1}{2}$ quarts of oats and some carrots.

After breakfast she is brushed off

and the night dress of bandages and cotton removed from her limbs. Then follows her morning exercise, hitched to a sulky or wagon when intended to go fast, or to a Payne cart when going slow.

At the end of this work she is rubbed with alcohol, getting regular massage treatment all over. Then she is bandaged and blanketed again and walked about for nearly two hours, and an hour and a half later takes an easy jog. After this comes her dinner, exactly the same as her breakfast, and succeeding that she rests till four o'clock, when she is walked about for an hour.

When she returns to the stable her bandages are put back on her and she is given her hay, which costs \$80 a ton. It is California hay, brought on here specially for her, as we find it is better for her than the ordinary timothy hay. At 6 o'clock she gets carrots and oats again, and another feast of the same sort comes at 9.30, after which Queen Lou goes to bed, well wrapped in blankets, from which only her fine head protrudes.

NEW YORK.

The Fetish Stone of the MacNabs

BY ANDREW LANG

THE world rejoices in the blunders and disappointments of antiquaries; in Monkbarns's "Prætorium," of which Eddie Ochiltree "minded the bigging;" in A. D. L. L., which really stood for "Aiken Drum's Lang Ladle," and in "Bil Stumps His Mark." For this reason, and others, I relate my own recent adventure with the Fetish Stone of the MacNabs, a blunder at once diverting and instructive.

To begin at the beginning: From old Caledonia stern and wild to New Caledonia, from Georgia and Ohio to Rajputana and Fiji, rock surfaces are found incised with rudely executed cups and concentric rings, and similar patterns. In Australia the rock designs are painted, but some tribes engrave the same patterns on small

oval stones, called *churingas*, which are used for purposes of magic and ritual, as probably was a similarly decorated bone amulet of palæolithic man, recently found in France. Four or five years ago, before the Australian stones were known to science, small disks of shale or stone, with decorations of the same character, were found by Mr. W. A. Donnelly in an old fort, and in a pile structure of uncertain age, in the estuary of the Clyde. I suggested that these small decorated stones were perhaps old magic stones or amulets, like those of Central Australia.

Now magic stones are still in common use both in rural England and in the Highlands. In Scotland they are usually either balls of polished rock crystal or disks of polished shale, or neolithic

"celts" (ax heads or adzes), or flint arrow heads, or ancient flint flakes, or even an odd pebble. The crystals and disks were probably at first used (as from Peru to Madagascar, from Australia to the Arctic Circle, and thence to Sarawak, and back to the expensive seers of Bond Street) for "crystal gazing." But now the magic stones of every kind are mainly employed in medical magic; they are dipped in water, and the water is drunk by ailing men or beasts. The practice, to my certain knowledge, is common to this day, not only in Lochaber, but in County Sligo, and the neolithic arrow heads are called "fairy arrows," *saigheadan shith*, or "elf shots."

So far, facts are certain. But to match the small recently discovered Clyde stones with decorative marks, I wanted a Scottish magic stone, analogously adorned. I was thinking of nothing less when, in the Lowlands (September, 1903), I met a Lowland gentleman who chanced to tell me that he possessed an old Highland magic stone, marked with concentric rings. It had been a fetish of the MacNabs (I give a pseudonym to the clan, they were not MacNabs). In 1810 it was brought to the Lowlands by my friend's grandfather, a MacNab, to whom it had been solemnly entrusted. It abode and abides in an old wooden box, black with age, and repaired strangely with wattle. The idea probably was to avoid the presence of iron tacks, as iron is notoriously fatal to magical or fairy influences, and the stone was a "fairy stone." Like all such fetishes, and the famous "Lee Penny" (a pebble in a silver coin), it is (or was) dipped in water, and the water is given to ailing cattle to drink. It is "the soveranest thing" against the effects of the Evil Eye, still as much dreaded in the Highlands as in Italy.

The fetish is a smooth, water-worn ovoid flint, rather bigger than a turkey's egg. The ends are somewhat abruptly flattened, tho still rather convex. In the very center of each end a polished circle surrounds a center in low relief. These two circles I looked on with suspicion, misdoubting that they were of modern origin. But, just where the egg-like shape had been flattened, there are rude

concentric rings going all round the fetish stone. These, I thought, had been made intentionally (as in Australia) for magical reasons, but not with a metal instrument. As far as the absence of a metal instrument went, I was right enough. But, now comes my blunder, I guessed that the stone had been cut out of a long, thick, neolithic adz, and then purposely marked with the fairy rings. This daring conjecture I published, announcing that, in all probability, here was a neolithic charm-stone from Scotland, with the concentric rings common on Australian *churingas*.

My error was that I took this piece of stone for a thing ground by human artifice, as a neolithic adz, and intentionally marked with the concentric rings for purposes of magic, perhaps after the true purpose of the adz was forgotten. In this opinion I was not, perhaps, so foolish as I may seem. There is a neolithic adz in the British Museum. A chunk cut out of it would be scarcely distinguishable, by a layman, from the fetish of the MacNabs. Again, apart from the Clydesdale finds (of which the genuine character is disputed), we know at least one "celt," or smooth stone ax head, which is decorated with incised patterns. It is of stone too soft for purposes of use, and is adorned with a late Celtic pattern. The Rev. Mr. Mackenzie, of Kenmore, who has published this stone ax head, thinks that perhaps "it had acquired a venerated or ceremonial character." Now my MacNab fetish undeniably had "a venerated character," the MacNabs deeming it a mystic and precious thing; but, in fact, it was not neolithic, but "neotatolithic"—namely, of the very newest and most recent kind of stone gear, employed in an age of iron by some thrifty farmer, who cut the expense of using metal and paying a blacksmith. That fact I found out, or rather I it "rubbed into me," when I carried the fetish of the MacNabs to the British Museum, a place where counsel may be sought. The eminent and learned authority whom I consulted said, "Neolithic! It is the pivot stone of a modern gear!"

I tumbled *de mon haut*; never having heard of gates whereof a post pivoted on an upright stone, placed in a socket of

another stone. "This rarity," I remarked, "is the undeniably old fetish stone of the MacNabs, a clan of great antiquity and valor." The authority observed that he was not responsible for the MacNabs. The fetish was the pivot stone of a gate. As the gate turned, the rotatory movement naturally produced both the circles inclosing the knobs in low relief and also the concentric rings. Similar stones, rings, knobs and all, were displayed. The evidence was overpowering; I had been bit! Moreover, the fetish was not a piece of a neolithic adz, as I rashly guessed, but a casual flint, worn by water into something like that semblance, not ground by the hand of neolithic man.

I fell back on the MacNabs. The MacNabs, in the eighteenth century, had no gates, I said; they just threw a hurdle across an opening in a "fail dyke," if such an opening led to a *boreen*, or lane. Whence, then, did these brave and loyal Celts (they were out with Prince Charlie) get a gate pivot, and, if they used gate pivots, why did they regard this ordinary example as a fetish?

Hitherto I had been in the degrading posture of receiving correction. My head was bowed, as it were, in the dust. But I now learned that if the MacNabs had no gates, "they had certainly water mills," and "the pebble" (or fetish stone) might have played a part in the spindle. This gave me an opening; my foot was on my native heath. I knew that the MacNabs probably had no water mills. The gentle Lochiel, about 1740, tried to introduce water mills into Lochaber. He failed because the clansmen, in a mountainous district almost roadless, could not carry their oats to the mills. The Highlanders, in the eighteenth century, ground their grain at home, like the Homeric Greeks, with querns—that is, with one heavy round stone on the top of another.

Whether the fetish of the MacNabs was the pivot of a gate or part of the mechanism of a water mill (and it certainly was one or the other) it could never have become a fetish if the MacNabs had understood its purpose. People do not attach magical virtues to a common article of every day use. It follows that the ingenuous Celts, who held

the stone in awe, and used it in medical magic, and contrived a kind of tiny wooden tabernacle for it, did not know what humbles uses the stone had served, could not account for the mysterious rings on its surface, and believed that it was "great medicine," as the Red Indians say. Savages (and the MacNabs) make magic of any odd stone. I have a small stone rather like a duck in appearance; the Zunis used it to bring luck in shooting wild fowl. The Scottish Kirk, after the Reformation, allowed the Lee Penny (a small stone set in an old silver coin) to be employed for the healing of cattle, just as the MacNab fetish was used. Any odd small stone was "fairy," was magical, especially if it bore traces of human workmanship, like flint celts, or arrow heads, or the MacNab stone. The Highland peasants did not know—many of them do not know yet—the real origin of the neolithic worked flints. Nor did the MacNabs, ignorant of gates and water mills, know the humble origin and purpose of their fetish. It was smooth, it was dark, it was in part polished, it had the concentric rings observed on many rocks, and often as ornament on the metal work of old Highland sporrans. Therefore, the stone was fairy, or *fée*, as Perrault says of Bluebeard's key. "What else could you call it?"

How did the untutored MacNabs get the stone? Possibly in a Lowland raid; possibly in the Forty Five; as probably a casual MacNab, reaping in the Lowlands for hire, picked up the mysterious fairy thing and carried it home in the neuk of his plaid. We see that the products of an unknown culture, the neolithic age, *behind* them, were and are things of magic to the Highlanders; and so was this lowly product of a culture *in advance of theirs*, that of the Sassenach with his water mills and gates, themselves now rude and antiquated. This is a curious fact in Highland superstition, so I do not much regret my disillusionment over the "neolithic" magic stone. After all it is "neotatolithic." We do not use flints to-day for gate pivots or in the mechanism of water mills. But thrifty Lowland farmers were apt to save the expense of iron and of blacksmiths' work by making at home the stone pivot and stone socket. I have

also seen examples of these from Piedmont and Egypt. The Homeric chief who won a big lump of iron at the funeral games for a dead hero, and wrought it at home, was, so far, more advanced than the Lowland farmer with his pivot stones; and "out of all whooping" in front of the gateless MacNabs.

Thus my blunder about the MacNab stone and the MacNabs' blunder about its fairy qualities lead us up and down

in the history of man, from the dateless palæolithic cave dwellers of France to the Central Australian savage, the ingenuous Highlander, the Northern farmer, and the blunderer himself.

If any American reader happens to know of these amulets, decorated with patterns, among Amerindian relics, he will greatly oblige me by communicating the facts.

LONDON, ENGLAND.

Municipal Corruption

An Interview with Joseph W. Folk

[The following statement was obtained by a representative of THE INDEPENDENT at an interview with Mr. Folk, who has examined it and given it his approval. As a result of Mr. Folk's labors in the office of Circuit Attorney at St. Louis, nineteen persons, either givers or receivers of bribes in connection with the corrupt traffic in municipal franchises in that city, have been convicted and sentenced to be imprisoned in the penitentiary. He is now engaged in the prosecution of corrupt members of the Legislature of the State. He was asked by the President to assist in prosecuting the Postal Service thieves, but would not lay aside the duties of his office.—EDITOR.]

A VISITOR from an adjoining State in which official corruption has never seemed to exist happened in St. Louis just after the Missouri Senate alum scandal had been laid bare, closely following the revelation that members of the St. Louis Municipal Assembly had accepted \$250,000 in bribes for a street railway franchise, to say nothing of the city lighting steal of \$47,500, and dozens of other specific betrayals of public trust in city and State legislative bodies. This visitor, utterly shocked to see names of men hitherto respected brought to disgrace, exclaimed: "Is there anybody in Missouri that is honest?" Lest others not locally con-

versant with affairs in Missouri should take the same point of view, it ought to be said for the honor of the State and its chief city that the official corruption, which possibly is covered in some other portions of the country, has been brought to glaring notice in St. Louis and Missouri. Other cities have been as corrupt, and the officials of other States as venal, but in the World's Fair city and State we have adopted the wholesome method of public punishment, not alone by the means provided in the laws of the State, but also by that which the boodler fears most of all—an aroused public conscience.

The tremendous wrong which some legislators and municipal representa-

JOSEPH W. FOLK

tives have for years carried on against Missouri taxpayers is a fact that is not merely whispered from lip to lip. The general public knows just how much and how it was robbed. For voting for a street railway franchise, in 1898, 25 out of 28 members of the House of Delegates accepted bribes of \$3,000 apiece, and seven members of the City Council received from \$10,000 to \$17,500 each for their votes. One Councilman, with an eye to the main chance, accepted \$50,000 from the representatives of the railway, and then returned \$25,000 that he had previously accepted from the interests opposed to the bill. He could not "honestly" earn this \$25,000, he said. Later he gave up the \$50,000, telling the franchise promoter that he desired the dignified sum of \$100,000. Hoping to receive this amount, he voted for the bill, and finally, after many trials and tribulations, he succeeded in getting \$5,000. The promoter obtained his franchise. It cost him \$250,000 in bribes, not one cent of which went to the city, and he sold it for \$1,250,000, at a profit of \$1,000,000. But a Missouri jury has now sentenced this promoter to five years in the penitentiary.

Two separate sums of \$75,000 and \$60,000 for division among the members of the House of Delegates and the City Council, respectively, in return for the passage of railroad franchises, were caught between the lines and have been produced in court and counted before juries. The money in each case had been placed in the lock box of a trust company. One key of the box was held by the representative of the railroad, and the other by the agent of the combine, with the agreement that the money should be turned over to the bribed voters so soon as the ordinance was passed.

The \$47,500 referred to above, which secured the passage of an ordinance to light the city, was distributed through an arrangement actually made on the floor of the House of Delegates, the 19 members of the combine meeting to receive their portion of the plunder of the "birthday party" at the home of one of their members who has now become notorious. On another franchise the 19 received \$2,000 each for their votes.

Not only were these corrupt public servants ready to receive bribes; they

sought them. Laws were boldly sold to the highest bidder. In both branches of the Municipal Assembly schedules of bribe prices were fixed, varying from a few hundred dollars for a switch bill to thousands of dollars for a franchise. The water works and the sewage system were put on the market, as well as the court house. Utter shamelessness characterized the action of these miscreants. They flaunted their corruption in the faces of the people. In the State a faithless Lieutenant-Governor took bribes and distributed bribe money among Senators. An attempt was even made to induce a former Governor to make a State appointment for money, while the confessions of Senators admit that thousand dollar bills and lesser "drift-wood," as it was called, have been the purchase price of laws in the State for years. On one occasion, when a new member of the city combine expressed fears that trouble might follow a meeting at which \$2,500 each was passed around in bribe money, he was laughed at and assured that the political power of the boodlers was too great for any one to bring them to justice. Each of the nineteen, he was told, controlled his own ward, and they and the bribers were strong enough politically to annihilate any one who would insinuate wrong-doing against them.

Yet, despite the arrogant claim that 30,000 votes in St. Louis are controlled by these corrupt influences, and despite the millions of dollars which the corruptionists have at their control, witnesses have not been lacking when it came to the prosecution of the guilty ones. Speaking especially of St. Louis, nineteen of the givers and takers of bribes have been brought to trial, and have each received from two to seven years in the penitentiary, while a dozen others have turned State's evidence. The St. Louis Grand Jury is still fully occupied in finding indictments.

The eradication of corruption is an issue that now confronts the voters of St. Louis and Missouri, overshadowing all other issues. I do not believe in closing our eyes to it, lest by speaking of it the city or State to which we belong may be injured. No community can be injured by the enforcement of law. There is no secret remedy known for corruption. It

cannot be cured by hiding it. The only way to stop it is to hit it hard with the hand of the law whenever it rears its ugly head. It is folly to say that any honest man can be injured by exposure of the truth.

The present is a time when the State

sorely needs the patriotism of peace. Missouri, which is fifth in population of the United States, will rise to be first in civic righteousness if the masses of the people, who still are honest, will not neglect their right of voting for the honor of the State.

ST. LOUIS, MO.

The Gypsy Camp

BY THOMAS WALSH

OUT beyond the camp-fire's gleams
The gypsy chieftain stands and dreams.
In his heavy eyes, the south;
Passion burning on his mouth;
Youth and splendor in his air,
King of men,—he muses there.

The woods are black; the winds are high;
The crackling embers hiss and cry:
"Alas, alas, the days gone by!"

Shadows from the village steal
By his lonely wagon wheel,
And with lingering eyes on him
Seek the witch's fireside grim.

"Gypsy, come, our fortune tell."
"There is some one you love well."

"Nay, but more do not refuse;
Which of us shall lovers choose?"

"You—a lady by your hand—
Shall be wedded for your land.

"You, who are but serving maid,
Find your toil in kisses paid.

"Nay, you seek for lovers true?
Then I have a sight for you.

"Look upon this bosom—nay,
Turn your eyes not thus away;

"None had prouder breast than I——"
("Alas, alas, the days gone by!")

"Once a lover, brave and fair,
Gladly laid his forehead there.

"Look—these tresses white and thin.
When did their decay begin?

"And these lips,—he found them sweet.
Ah, how madly ours would meet!

"Like the panther's was his tread;
Haughty shoulders bore his head.

"When he struck me, I had pride
That I was a gypsy's bride,

"For I loved him, as alone
Woman loves a heart of stone."

"He is dead, then, gypsy—say?
Tell us quick, we must away."

"Dead, alas." "Yet who is he?
Yonder youth so fair to see?"

"He? Alas, you are undone;
That is but his father's son.
Hark, the screech owl now returns.
In my palm your silver burns.
Be off, his mother bids you fly.
The woods are black; the winds are high!"

("Alas, alas, the days gone by.")

BROOKLYN, N. Y.

Literature

A Science in Embryo

THAT sociology is still in its embryotic stage is illustrated by two recent works, one by Prof. Lester F. Ward,* and the other by the late Dr. J. H. W. Stuckenberg.† Its development into an established and acknowledged science, the data and conclusions of which are generally agreed upon, is evidently a matter for the distant future. The guesses as to what sociology is, what its subject matter should be, and what the study of it reveals, are many and various. It has been interpreted as the philosophy of history, as political economy, as association, as anthropology, and as the struggle of races. Professor Ward, indeed, instances some twelve "unitary principles" under which the science has been described or on the basis of which it has been interpreted, and he acknowledges that "there are, of course, others." Verily, there is grave need of the sociologic pundits "getting together" and reaching some kind of a common verdict.

To Dr. Stuckenberg sociology is the science of human society. That the same degree of exactness and certitude which obtains in the natural sciences is not possible in this study is admitted, yet it is a science for all that. It is the science of no particular phase or characteristic of society, but of the underlying principles attending the origin, growth and continuance of society as a whole. It seeks to determine what is common to all societies, and thus gets for result the genus society, of which "all existing societies are species or differentiations." It is this genus society which is the subject matter of sociology.

Professor Ward, however, requires a more limited and specific basis. To him sociology is the science of human achievement. Its subject matter "is not what men are, but what they do. It is

not the structure, but the function." The range of data required for a proper interpretation of the science is practically unlimited. "All the sciences contribute to that highest science, social philosophy;" but the interpretive range is limited to the one standpoint of human achievement.

From beginnings so different, it is not to be supposed that the two authors will work mutually toward agreement; and, indeed, the following pages reveal growing divergences. So wide apart in basic principles, in methods, in the choice or the interpretation of data, are the two works that a beginner may well imagine the authors to be writing about wholly different subjects. Occasional approaches to agreement are reached, as, for instance, when Dr. Stuckenberg acknowledges that society is not the product of the being, but of the action of men, and when both authors solemnly reiterate the fact that the science is only in process of establishment. But throughout the contrarieties are plentiful and often irreconcilable.

That the economic struggle is an enduring and determining force in social development is declared by both authors. "Not only," writes Professor Ward, "does civilization rest upon a material basis in the sense that it consists in the utilization of the materials and forces of nature, but the efficiency of the human race depends absolutely upon food, clothing, shelter, fuel, leisure and liberty." Dr. Stuckenberg repudiates the over-emphasis which the Marxists give to the economic basis, yet he classifies the bread-and-butter struggle as one of the two fundamental forces (the other being political) and says of it:

"Its basal character can be ignored only by ignorance, or by a false spiritualism which itself depends on economics for existence."

To what goal does social progress make? In Dr. Stuckenberg's view the social tendency is the perfection of society, the establishment of right relations between the individual, the group and

* PURE SOCIOLOGY. *A Treatise on the Origin and Spontaneous Development of Society.* By Lester F. Ward. New York: The Macmillan Co. \$4.00 net.

the nation. An important, if not the most important, manifestation of this tendency is the growth of internationalism. He traces social development through the consanguine organization to the political era, characterized by the institution of the state, and then details the tendencies making for a third era, that of international organization. The biological analogy is often used; in societies, as in physical life, there is movement from the simple to the compound and complex, differentiation and integration. The ideal of internationalism is not sentimental. He discovers "a substantial movement toward internationalism which differs fundamentally from that vague and sentimental cosmopolitanism which is the utopia of dreamers." The society of nations does not involve a compounding of nations, but the establishment of specific and equitable relations between them, which, with the increasing differentiation and integration of society, grow more close and intimate.

Social happiness, social safety, social welfare, are the triune goal in Professor Ward's view; and though he withholds the pushing home of his argument for use in a coming volume on "Applied Sociology," it is not difficult to see that he looks to collectivism as the institutional expression of the ethical sense of mankind. The recent progress of collectivism is summarized, and the tendencies making for further growth are related. His criticism of Spencer and other upholders of *laissez-faire* is keen and trenchant. The term freedom he uses in the positive sense insisted upon by the late Thomas Hill Green, and this freedom, this "positive power or capacity of doing or enjoying something worth doing or enjoying, and that, too, something that we do or enjoy in common with others," he finds coincident in growth with the advance of collectivism.

Both these works are notable for their scholarship, their intellectual power and their sincerity. The broader outlook, and, it is hardly to be doubted, the wider range of knowledge, are Professor Ward's. His scientific attainments are of the greatest, his skill in statement and argumentation is a rare one. Unfortunately, his diction is often careless. He writes with what is apparently an exuber-

ant facility which takes small note of the pruning and mending needful for a clear style. The result is that, while many of his figures are graphic and his allusions luminous, there is sometimes to be found a tortuosity of expression wherein the thought is well nigh lost. One of his stylistic faults is the use of the word "only." It is frequently employed, and almost invariably before the wrong word or clause, necessitating on the reader's part a reconstruction of the sentence before the meaning can be seized. Dr. Stuckenberg writes with a greater simplicity and correctness. If his style is less striking and varied, it is, on the other hand, clearer, and the thought is more readily followed. One is lightly reminded, in comparing the two, of Dr. Johnson's famous passage on the styles of Dryden and Pope.

James Madison

WITHIN the space at our command it is impossible to give an adequate review of a work* which is not so much the life story of one man, or even a summary of the activities of one or two groups of prominent men, as it is a political history of the United States from the close of the War of the Revolution to that of the second war with Great Britain.

For his time and country. Madison was a scholarly man and was born to a good inheritance, both of which things go far toward making a power of the right sort of man. He also possessed a good measure of some of the other qualities or faculties which help to make a reputation, yet Madison was never called great. He was overshadowed, was one who was led rather than a leader, whose abilities were commanded by others rather than put to their best uses by himself. He was truly a patriot, seeking the best good for his country with all his heart and all the powers of his intellect. As a statesman he was far-sighted and prudent, and incorruptible, save by the flattery of those whose good opinion he valued at more than its true worth. His services in the drafting of our Constitution and in cogently advo-

* THE LIFE OF JAMES MADISON. By Gaillard Hunt. New York: Doubleday, Page & Co. \$2.50 net.

cating its adoption by the several States have always been recognized by all parties and are here set forth with new force.

It was both the good and the ill fortune of Madison that he and Jefferson should have formed for each other one of those strong friendships, dominant on the one side and subservient on the other, which are not uncommon between two men of equal but differing mental endowments, of similar tastes and of dissimilar characters. It was fortunate for Madison in that the younger man,—Jefferson was by twelve years the elder,—profited by the patronage of his senior; and unfortunate in that the more assertive, more impulsive, more adroit, more at-

tractive and less conscientious Jefferson became a too dominant influence in the life of the man who loved him with the unscrutinizing admiration of affection which is often given by a younger man to a magnetic elder.

It was before this affection had gained so strong a hold upon the younger man that Madison's best work was done. While the Constitution was in process of construction and the after task of securing its adoption by the States was occupying the best powers of Madison's

mind, Jefferson's influence was felt, but not injuriously so. At a later period the latter's personality became so strongly influential that Madison was considered by friends as well as opponents more as Jefferson's tool than as an independent mind. In its private aspects the friendship was admirable; but, as Mr. Hunt shows, there were some ways in which it became a public misfortune.

As a biography the present is somewhat deficient in the personal element which imparts life and interest. This is

JAMES MADISON, AGE 76

Bust by John H. J. Browere

Made in 1827. In possession of the Virginia Historical Society at Richmond, and now published for the first time.

partly due to the lack of that unknown quantity or quality which, for want of a better name, is called personal magnetism, on the part of the man around whose name Mr. Hunt has built his history, and partly, perhaps, to a lack of appreciation of the value of this potent element in adding attractiveness to an otherwise dry subject. Whatever the reason, a most excellent work is marred by the absence of this charm.

Mr. Hunt's *Life of James Madison* is among the soundest works in regard to this period of our history which has yet appeared. It is careful, well considered, thorough, and, tho not entirely just to the old Federalists, Mr. Hunt is not as bitterly unjust as are many modern writers, while he is fairer toward them than were those irascible old gentlemen themselves, in their own time, toward their political opponents.

Short Stories

WE have many short stories these days. Life itself is being abbreviated into something like short story length. More is going on in the world than ever before, but that is why we have not the time to tell it in three-volume editions. And the "average reader," for whose delectation most fiction is written, demands that even his romances be served in one-sitting lengths. He despises the tranquil pleasures of the "gentle reader" who, when there was less hurry a generation ago, preferred a novel of sufficient volume to occupy him for at least a fortnight. But the latter was not really so exacting of the author's invention. He was willing for the heroine to retire, sleep a whole night and refresh herself between scenes; nor did he require a midnight alarm of burglars to "keep up his interest." This is stagnation to the average reader. If the heroine sleeps, the hero must be up and doing, even if it is murder. It is not art or truth that pleases him, but sensation, movement. He is always on his way to an emotional climax, all of which accounts for the opportunity and popularity of the short story; especially for its vulgarity.

This is why Mr. Nesbit's volume of life sketches* should be received with peculiar appreciation. The title is pedantic and the initial story appears to have been written a trifle too boldly in order to give it an acuteness suited to that class of readers who cannot take a delicate hint, but must have significance threaten them in some obvious form before they recognize it. But taking the collection as a whole, they are remarkable examples of literary style, admirable thumb-nail sketches from life. The author's genius consists in daring to end the tale before he mars the brevity, beauty and truth of his conception, and his taste is evident in the choice of material. It is not life he depicts, so much as fleeting phases of it. This is itself a delicate discrimination in a short story writer.

Those who read "The Modern Obstacle" know that Alice Duer Miller writes an entertaining story, and that she is familiar with the peculiar types of femininity produced by New York society. These women are one of the exports of this country, and wherever found, they do credit to the system which develops them. They are effective and contrast successfully with any foreign situation. Of the two stories that compose this volume† *Calderon's Prisoner* is the more important. This time a New York girl makes her adventures in a Central American republic. She is a pretty pink and white combination of wit, vanity and courage, exceedingly gifted with fine raiment. (It is Miss Miller's distinction to have produced the best dressed women of the year in fiction!) And she becomes sufficiently involved in the skillet politics of the little republic to be made a sort of private prisoner of war by the commander in chief of the army, who, of course, marries her in the end. Now it is not often in a modern novel that the lover gets a chance to imprison the heroine. Not infrequently it is the other way. He is laid at the feet of the heroine, wounded and unconscious, who becomes "a ministering angel thou" in his feverish imagina-

* THE LITERARY SENSE. By E. Nesbit. New York: The Macmillan Co. \$1.50.

† CALDERON'S PRISONER. By Alice Duer Miller. New York: Charles Scribner's Sons. \$1.50.

tion. But well the reader knows that he will be kept flat on his back by the relentless author until he succumbs to her more human charms. In this story, however, the delicate business of holding the indignant lady a prisoner is accomplished very plausibly, and we are grateful for the exchange, especially since the details prove that women are more interesting, more charming in every way than the most desperately wounded and delirious man can be.

It is not an easy matter to define Mr. Christie's stories[†] of savage clan life among the Highlands of Scotland. There is something queer in each conceit; and for aught we know it may be the fierce old Gaelic flavor, but if so Sir Walter Scott and others failed to give a proper interpretation to pibroch human nature. The legends are characteristic, but the characters are not. And as to the scenery, there is enough common dampness, but it is not the mists that give a dewy freshness to the "banks and braes" of Scotland. And where is the scent of peat and heather? When a country has a sort of national odor, no writer can afford to ignore the fact, any more than he ought to ignore its dialect or peculiar idioms of speech.

We have perennial imitations of certain old classics in fiction. Some one is always trying his pen at drawing another Crusoe. Don Quixote has had many a bandy legged disciple in these latter days. But the book which inspires modern story tellers to emulation oftener than any other is "The Arabian Nights." This error is not so much an evidence of unpardonable audacity as it is of the fact that the ambitious writer is deceived by the easy incredibility of these ancient tales into the belief that he is able to do as well provided his powers of exaggeration are sufficiently developed. *The Strange Adventures of Mr. Middleton*[§] are founded upon this fallacy. They are interesting as ordinary yarns, but so far as the author's purpose is concerned, they are a failure. They are too deliberately absurd, too consciously im-

possible. The charm and delicacy of "The Arabian Nights" consist in their ancient sincerity. They were founded upon an absolute faith in the idea that nothing was incredible. And they come out of an age where truth had not been separated from imagination. And the modern mind can no more produce such fiction than it can accept the hobgoblin superstitions of the past. Our psalms, fables, pastorals and Arabian night tales have been written. Nothing remains for us but to tell the truth as entertainingly as possible.

Reciprocity

THIS book* is a storehouse of facts and arguments upon reciprocity which no student of American tariff conditions and trade expansion can afford to ignore. The field covered is principally the development of the reciprocity idea since 1890 and its connection with the Republican protective policy, but the authors have also discussed the origin and the early development of that idea before it assumed its present importance, and they have shown how the various and peculiar sense which, they contend, attaches to reciprocity in our politics, as compared with that of European countries, had become established many years ago. For example, Europe and this country differ radically as to the construction of the "most favored nation" clauses in treaties, the former automatically extending them in a liberal spirit to other treaty nations complying with certain conditions, while the latter restricts them to the United States and the particular treaty-making power.

Briefly stated, the fundamental idea of the book is to show that reciprocity, as at present understood by the United States Government, has not been and cannot be successful because it has been conceived in a narrow and fragmentary way; in other words, because there has been no general reduction of our tariff duties in return for correspondingly im-

portant reductions to us. Several chapters are devoted to illustrating and enforcing this truth. The abortive treaty with Mexico, the attempts to negotiate with Cuba (exclusive of the treaty after the late war with Spain), the visits and investigations of various commissions to the South American republics, the fate of the reciprocity provisions of the McKinley Act, and later those of the Kasson treaties—all these failures have resulted from an unwillingness to do more than offer concessions which were not thought valuable enough to induce foreign countries to make trade exceptions in our favor.

The case for reciprocity with Hawaii is different, and it has proved highly beneficial to both countries. In connection therewith the intimate relation of the sugar question, both in its domestic and foreign complications, to the question of reciprocity, has been demonstrated in this book with great clearness and force.

During the past twelve years the political line of cleavage between the Republican and Democratic parties has been sharply distinct in regard to reciprocity, and Professor Laughlin has made it plain that, as the Democrats will have nothing to do with it, the Republicans must make reciprocity effective on liberal lines if they are to avoid disaster. Nothing has been more marked in our recent political history than the positive declarations of the Republican platform in favor of reciprocity and their flat defiance of certain protected interests. This will shortly prove the test of genuineness of Republican profession; what McKinley, Roosevelt, two National Conventions and many State Conventions have asserted to be good Republican doctrine has been repudiated and must soon again be decided upon by another National Convention and meet the risk of another campaign.

Professor Laughlin avoids all partisan treatment of the subject, and is so thoroughly informing and convincing that this book must be accepted as an authoritative manual. An especially valuable feature is the appendix, which contains an exhaustive bibliography on reciprocity and also the text of the various reciprocity treaties and agreements between the United States and foreign countries.

Fanny Burney. By Austin Dobson. [English Men of Letters.] New York: The Macmillan Co., 75 cents net.

Of biography of a certain sort this is a perfect model. It is a mere commonplace to say that Mr. Dobson knows the anecdotal, personal side of the eighteenth century better than any other living Englishman, and in making a book chiefly from Madame D'Arblay's Diary and Letters he had a theme perfectly adapted to his genius. It is the little touches on every page that count, little touches that make such easy reading, but are the result of pretty exacting study on the part of the author. Thus, we read that among the visitors to a certain house was Handel, "playing intricate fugues and overtures with his *pudgy* fingers upon the harpsichord;" and, again, to describe one of Fanny's brothers, a quotation is taken from Southey, who depicts him as "smoking after supper, and letting out puffs at one corner of his mouth, and puns at the other;" and, again, to illustrate Miss Burney's pithy philosophy: "What's done can't be undone," Mr. Dobson remarks: "Dr. Johnson himself could not have been more oracular, tho he would probably have said (as indeed he does in 'Rasselas'), 'What cannot be repaired is not to be regretted.'" And so one might go through the whole biography picking out these apt illustrations that seem to make the age live before us. Of criticism in the more philosophical sense, such as Sir Leslie Stephen gave us in his "George Eliot," there is little or none, and indeed it is scarcely called for in writing of the author of "Evelina."

How to Judge Architecture. By Russell Sturgis. New York: The Baker & Taylor Co., \$1.50 net.

It has been said that rules are made for the benefit of those who do not think. The searcher, therefore, for a method of judging the artistic value of architectural movements by labor-saving formulas may well be discouraged when he learns, from the first pages of a book entitled *How to Judge Architecture*, that the reader must feel assured that there are no authorities at all in the matter of architectural appreciation; that rightness is relative, and that the only safe

method for the collector of small objects of art, or the judge of any sort of art, is to hold firmly to his sense of what is lovely and intelligent, as this mark of authenticity is at least as valuable as dates and signatures. These things being true, all that the author can do is to help the reader to acquire an independent knowledge of the essential characteristics of

dice. Then examples of the best existing buildings, from many lands, by many races of men, are placed before his eyes by means of illustrations, described and criticised in a manner beautiful for its lucid simplicity. Mr. Sturgis never loses sight of the fact that he is writing for the technically ignorant. He chooses certain features as essential to the differ-

The New York Life Insurance Building at St. Paul, Minn., One of the Best Examples of Modern Architecture

good building and decoration. But if the reader is honest he will acknowledge, after weighing what he has read, that he has received all the help in judging of the beauty and rightness inherent in architecture that could be imparted in a popular treatise on the subject. He is first warned to clear his mind of preju-

ent orders of architecture, and these he photographs on the memory as with a flashlight. All who know anything of Roman architecture have heard of the structural importance of arch, vault and dome in its system; but probably few of the confessedly ignorant have ever before fully realized what the develop-

ment of these forms by the Romans signified in the architectural possibilities of the interiors of buildings. Nothing is more interesting in Mr. Sturgis's work than his wide range of selection, beginning with the Temple of Neptune at Palestine and ending with the New York Life Insurance Building at St. Paul. This last example is given to show that even a modern skyscraper can be artistically designed and ornamented. Since the wholesale destruction caused by the French Revolution, architecture has been in a chaotic condition, but Mr. Sturgis considers the conception and congruous completion of such a building as this commercial house in St. Paul a sign that modern needs and artistic design are not irreconcilable.

Robert Morris, Patriot and Financier. By Ellis Paxson Oberholtzer. New York: The Macmillan Co., \$3.00 net.

It was high time that a worthy biography should be written of Robert Morris, for he was a great man and one of the truest patriots of an age which boasts of many. Known by the historical student, he has been much neglected by the mere reader of history. His misfortunes of later life and the false aspersions of those whose envy had been excited by his previous good fortune, united to his political opinions, which were those of Marshall, Hamilton, and other great men of the old Federal party, have been too long allowed to cast a shadow over one who, in his own line, was as truly great and self-sacrificing as any of them. The present biography is founded for the most part upon the valuable Robert Morris papers, which were recently acquired by the Library of Congress from the Gen. John Meredith Reed estate, while no previously accessible material has been neglected. How those papers came to be taken to France is not known, but it was there that General Reed found them many years after Mr. Morris's death in a country town—sixteen big volumes of historically invaluable manuscript—about to be taken to a paper mill! They embrace Morris's official diary and letter books during his entire term of office as Financier, besides three volumes of letters of a later date. The

biographer's work is well done in all respects, bringing not only the Financier, but the man, the courageous, warm hearted, honest and sanguine, the successful and the disappointed man, to the friendship of the reader.

The Founder of Christendom. By Goldwin Smith. Boston: The American Unitarian Association, 50 cents.

No one is attempting a biography of *The Founder of Christendom* to-day, for the reason that such preliminary ques-

ROBERT MORRIS

tions as the Messianic self-consciousness of Jesus, his eschatological views and their relation to his ethic, still wait solution. It is a time for monographs, not for an exhaustive life of Christ. Professor Smith's effort to set forth the essential in Jesus's message crowds a great deal into remarkably small compass, and has the advantage of presenting a sharp, clear-cut picture, without the blur of a mass of detail. Its value is in its stimulus to draw such a picture for one's self of one's own impression of *The Founder of Christendom*. Its limitations are due to insufficient knowledge of the religion of Judaism in the time of Christ, which leads, for example, to suppositions con-

trary to fact on the influence upon Jesus of Pharisaic formalism and the presence of wealth in Galilee. It is not free criticism, but failure to steep one's self into the spirit of the synoptic Gospels, which asserts that Jesus gave no positive assurance of immortality, declares that he threw down the bar between Jew and Gentile, and tries to crowd his religious message into the formula of the Fatherhood of God and the Brotherhood of Man.

Winter India. By Eliza R Scidmore. New York: The Century Co., \$2.00 net.

A delightful description of the grand tour of a country whither the American tourist seldom goes, told with a degree of humor and an appreciation of "contemporaneous human interest" seldom encountered in works of travel. The journey begins at Tuticorin, proceeds to Madras, Calcutta, Benares, Lucknow, Agra, Delhi and the Khyber Pass, and thence by way of Simla and Jeypore to Bombay. But the geographical extent figures little beside the charm of the narrative, and that would have been as great, we fancy, had Miss Scidmore confined herself to a single one of the strange places she pictures; to Benares, for instance, where at sunrise the Brahmins pray beside the Ganges, or Agra, where her prose becomes musical under the witchery of the perfect lines of the Taj-Mahal, or any one of the half dozen or more cities where jewels blaze, and elephants march and priests chant, and scenes as from another world follow in bewildering succession. Yet the best thing about the book is the ingenuity with which the realities of actual travel are made the background to all this romance and color, and concerning the necessary experiences in getting about India Miss Scidmore cherishes no illusions whatever and sedulously destroys any which her readers may happen to possess. The land of blazing sun and jungle may be bitter cold, in many a place snakes are not, save in zoological gardens, and tigers lurk only in well protected cages. The railways are abominable, "parlor cars" are unknown, and as for the hotels, for them

are uncorked not only whole demijohns of wrath, but they are anathema, cast out and solemnly pronounced "the worst in the world." There is no glamour about it all, insists Miss Scidmore, except in anticipations and recollections, and strong is the soul who can rise above the petty miseries of the moment. Perhaps so; yet none the less we defy anybody to read this book without mentally registering a resolution "some day" to go over that very same journey and see for himself, and that is the best compliment which can be paid to any writer of travels.

The Nemesis of Froude. By Alexander Carlyle and Sir James Crichton-Browne. New York: John Lane.

It would have been wiser and more dignified if the representatives of Carlyle had preserved that silence which Carlyle himself preached so strenuously, yet it was perhaps more than human flesh could bear to let pass unnoticed the pamphlet, "My Relations with Carlyle," published by Froude's heirs. The charge in that pamphlet was gross and absurd; as the present rejoinder says, no one with any psychological knowledge or with a mind not wholly unbalanced could read Carlyle's early letters to his wife and believe for a moment the silly slander concocted by Miss Jewsbury and bottled up by Froude for future use. This is an unseemly quarrel and dishonors every one concerned with it. The result of it all seems to us perfectly clear: Froude's original picture of Carlyle is in the main correct, but was written with that imaginative art which throws into salient relief the characteristic features of its subject. There is, when examined closely, a manifest exaggeration in the portrayal, but when looked at from the proper distance (or, to drop the metaphor, when perused with the ordinary dullness of the average reader), the result is clear and veracious. Later in life Froude, possibly from worry over the scandal raised by Carlyle's heirs, lost his balance, and in a moment of weakness wrote that incredible folly, "My Relations with Carlyle," which only tends to throw discredit over his whole work.

Literary Notes

DR. HENRY VAN DYKE has made an excellent selection of Tennyson's Poems, which with the editor's Introduction are published in a very attractive volume by Ginn & Co.

....Parents who have boys to send to school, and boys who are at school, will be glad to see Mr. Oscar Fay Adams's "Some Famous American Schools." The book, in a series of chapters, gives sketches of Nazareth Hall, Phillips Andover, Phillips Exeter, Lawrenceville, St. Paul's, Saint Mark's, Shattuck, Groton and Belmont Schools. (Dana Estes & Co., \$1.20 net.)

....The Macmillan Company are publishing a new library edition of the "Complete Poetical Works of Alfred (Lord) Tennyson," in six volumes. Each volume contains a portrait.

....Mr. William Butler Yeats is now visiting the United States, at the invitation of the Irish Literary Society, of New York. Mr. Yeats is perhaps the best known of the leaders of the Gaelic Revival, and will give lectures on this topic.

....Thomas Y. Crowell & Co. publish "The Complete Works of Edmund Spenser, with an Introduction by William P. Trent," in a single volume. This edition has one unusual advantage that it contains Spenser's prose dialog, "A View of the Present State of Ireland."

....From Charles Scribner's Sons comes a volume containing "An Unpublished Essay of Edwards on the Trinity." In his Introduction Professor Fisher, of Yale University, treats at considerable length of Jonathan Edwards and his Theology. (Price, \$1.25.)

....The discussion in New York over the deepening of the Erie Canal lends a special interest to the chapters on Inland Waterways in Ellen C. Semple's "American History and Its Geographic Conditions." (Houghton, Mifflin & Co., \$3.00 net.)

....Two new volumes have appeared of the Library Edition of Charles Kingsley's Works, including "Yeast" and "Poems." (J. F. Taylor & Co.) Like the preceding volumes these contain biographical introductions prepared by Mr. Maurice Kingsley, the author's eldest son. This edition is the first to give correctly the year when each poem was written or published. The editor holds that the object of Kingsley's life might be summed up in the quatrain written to one very near and dear to him:

"Be good, sweet maid, and let who will be clever;
Do noble things, not dream them, all day long;
And so make life, death, and that vast For Ever,
One grand, sweet song."

Pebbles

"THAT man Brown has just bought a fur cap and a pair of skates." "What for?" "To serve his own ends, I suppose."—*Princeton Tiger*.

...."What's in here?" asked the tourist. "Remains to be seen," responded the guide, as he led the way into the morgue.—*Columbia Jester*.

....*Anxious Arabella*: "I hope it doesn't bother you to have my hair blow in your face?" *The Brute*: "Not in the least. I was born in China. I can eat rats."—*Princeton Tiger*.

....They stood by the old well together. "How shall we drink?" he said. "There is no bucket here." She lowered her eyes, when she raised them again they were full of water.—*Princeton Tiger*.

"What makes the cat-boat go so fast?"

Asked little Willie Spink.

"The dog-fish must be chasing it,"

Said father, with a wink.

—*Columbia Jester*.

...."Ollie" James, the giant from Kentucky, who is now a member of Congress, was making a political speech. "I want to ask you a question," shouted a man in the rear of the hall. "Well, my friend," asked Mr. James, blandly, "what is it?" "I want you to tell this gathering what is the difference between Grover Cleveland and Theodore Roosevelt?" "Nothing simpler," replied Mr. James. "Mr. Cleveland is too sedate to hunt, and Mr. Roosevelt is too restless to fish."—*Saturday Evening Post*.

....A Chinaman, visiting the United States, writes home about present-day Americans in this wise: "They live months without eating a mouthful of rice; they eat bullocks and sheep in enormous quantities; they have to bathe frequently; they eat meat with knives and prongs; they never enjoy themselves by sitting quietly on their ancestors' graves, but jump around and kick balls as if paid to do it, and they have no dignity, for they may be found walking with women."—*The American Antiquarian*.

THE BEST OF ALL.

"Tell me," he said, "a pleasant book
To take on my vacation."

"A check book," he replied, without
A moment's hesitation.

—*Exchange*.

Demetrios Kakopoulos,
The grocer's errand boy,
Was bounced. He called a customer
One of the hoi polloi.

—*Chicago Tribune*.

Editorials

Panama and the Future

IN the new canal treaty, signed at Washington last week, the United States "guarantees" and promises to "maintain" the independence of the Republic of Panama. This logically follows the events that have taken place on the Isthmus and at Washington since the 2d inst., and is in harmony with the remaining provisions of an agreement that gives to the United States virtually the absolute ownership in perpetuity of the essential parts of the Republic's territory. Within a zone at least twenty (and possibly thirty or forty) miles wide, stretching from one of the two Isthmian cities and ports to the other, we acquire "all the rights, power and authority which the United States would possess and exercise if it were the sovereign" of the entire Isthmian tract. When the additional grants of eminent domain in the two cities, of power to enforce order there, of islands, of naval stations, of transportation monopoly, etc., are taken into account, there is but little left for the 280,000 inhabitants of the Isthmus. The Republic becomes simply an outlying dependency of the United States. In promising to maintain its independence we are protecting what is already our own. This treaty will be ratified at Washington as well as at Panama.

What then? In accordance with the terms of this agreement we shall complete the canal and in due time make Colon and Panama healthful, as Havana and Santiago were freed from infectious local diseases by North American sanitation. The population of the Isthmus will cease to be South American. The influence of immigration from the north will be felt in the adjoining small Republic of Costa Rica, whose destiny is association with Panama. Possibly it will extend through Nicaragua and the other Central American countries to the southern boundary of Mexico. All these may become dependencies of our nation, and out of them States may eventually be carved. It seems to us that the wave of assimila-

tion and absorption will move northward, not southward, from the great artificial waterway. South of it rises an almost insurmountable natural barrier of mountains. Cauca, Antioquia and Bolivar will probably seek alliance or association with Panama. For a considerable time, at least, these Colombian provinces will not be subject to the modifying and improving influences that will be potent on the Isthmus and immediately north of it. Panama (probably, also, Panama's controlling protector) would not now welcome overtures from these neighbors in the South. Their association with her will be deferred.

Under the benign rule of Diaz, Mexico has enjoyed peace and has in no way seemed to restrain the restless energy of our people. A great stream of capital from the States has poured into her territory, to be invested there in railroads and mines. Continued peace and wise government must insure her independence. Nothing but a succession of revolutions, possibly following the death of her good President, and endangering both the property and the lives of American investors, can invite interference and restraint from the north. There is in the States no thought of aggression for the mere acquisition of territory or the extension of power. But history is made quickly in these opening years of a new century. It should be noted as an interesting fact that the American people are not inclined in these days to look with complacency upon long continued strife in adjoining countries where their capital is invested and from which the influence of such disturbance is so extended that it touches the lives and health of themselves, being peaceful neighbors. Such quarrels as have racked Cuba and Colombia for years not only cause a senseless sacrifice of life and treasure, but also exhaust the patience of powerful neighbors, who want to go on making money and improving their country.

In South America? Colombia has few friends there. Brazil is ready to recognize Panama; the Argentine President's

newspaper finds that our course on the Isthmus was justified by prevailing anarchy; even Chile only expresses sorrow, and Marroquin's eloquent appeal to Castro may only remind the Venezuelan President of the weakness of one who was recently his enemy. Bereft of the Isthmus, Colombia may become the prey of her neighbors, or be required to yield her scant income to European bondholders. The Isthmus was her most valuable asset, and in her folly she has thrown it away. Burdened with an internal debt so great that her paper currency is worth less than one cent on the dollar, she must now face the holders of her bonds, who see that the better part of their possible security has been lost. Here lies some danger of a new test of the Monroe Doctrine. Colombia can pay little or nothing; her debtors may set out to seize her custom houses. Further south the precedent established by our exceedingly prompt recognition of Panama may yet be cited, possibly by Germany, in behalf of the large German colony in Brazil, if the colonists should undertake to set up an independent State. Of such a movement there is now no indication, except in the perturbed mind of Colombia's Peace Commissioner, General Reyes; but it is among the possibilities, altho the relations between Brazil and the colonists are reported to be quite friendly.

It is in the extreme northern portion of South America, rather than in any other part, that the shock of the secession of Panama, with its sequences, may start a movement of disintegration, or introduce European claims again as a cause of disturbance. These northern countries should not be classed among Lord Salisbury's "dying nations," for as nations they have never lived. Their governments have commonly been exhibitions of brigandage and imbecility. Their fate in this century depends upon the patience of real nations which they annoy. If they can be neither improved nor restrained by the more intelligent and progressive Powers of the southern continent; if their greed and dishonesty and laziness shall continue to invite European interference and thus to wear out the patience of those by whom such interference has been strictly limited; then surely they will be subjected to the control

of the great and energetic Democracy of the North, and the civilized world will be enriched by an intelligent development of the abundant natural wealth which they are incapable of using for the public good.

Giving Thanks

THANKSGIVING is the most natural holiday ever devised. It was born of the farm, and it fits into the new mood of the people for country life. Its associations are all with country scenes; the turkey and the pumpkin are its symbols. The old fashioned Thanksgiving was a sort of home exhibition day. The wife cooked a portion of everything that the year had produced, and added her art in savory combinations. Her pride was in using nothing that had not come from their own acres. The roast turkey, or pig, the chickens in the pie were of her own breeding, and these were surrounded by squash, turnips, potatoes, carrots, all from her own garden; while the second course included pies of home grown ingredients. The meats were dressed with garden herbs, and even the spices were caraway and fennel and home-grown pepper. The cooking was done over maple or beech logs cut from a home wood lot, and in a home-built oven. There was nowhere a smell or taste of the market. This was the very innermost meaning of Thanksgiving. It was of the land, and because of the land; and it associated the divine beneficence with agriculture. It was God's footsteps across their own hillsides, and in their own valleys, that "dropped with fatness." This close relation between the farmer and God begat Thanksgiving Day. The New Englander had declared his economic independence of Europe more than a hundred years before the colonies thought of political freedom. Never was there such a demonstration of the ability of the people to take care of themselves. Only give them soil, and they could dispense with the patronage of lords and cities—so long as they dwelt under the shadow of the Almighty.

The drift of our population into cities was unnatural, unhistorical. It did not express the real genius of the folk that turned the wilderness into gardens. It

has been difficult to naturalize Thanksgiving into the atmosphere of the tenement or even of the luxurious mansions. Here everything is dissociated from and foreign to the idea that at the first underlay the day—the idea and spirit of independence. What should a man thank God for who depended on a salary, paid rent, and ate the products of other people's farms; and, in fact, did not know where his food and his raiment came from? Such people have to thank their neighbors and their employers, and cannot live as close to God as the farmer. The dweller in cities might laugh at the ignorance of the countryman, yet the retort was ample and adequate. From our offices we are unable to look out over fields of corn, and wheat, and clap our hands because of plenty. There are in November no loads of golden pumpkins trolling home from the fields; no visions of stooked corn flanking the creeks; no orchards resounding with the shouts of pickers, and the tap of hammers on the well-pressed barrels of Spitzenbergs. The only association with the harvest that we can have from city homes is that which comes through newspaper columns, or is ticked off in grain quotations. There is a foreign flavor to everything; even to the milk, which to us is associated with cans and grocers, rather than with cows; and the turkey that is selected from a carload brought from Western prairies, or possibly New Hampshire's hills.

It is because of its revival of pure Anglo-Saxon life and spirit that we rejoice in the reaction from city congestion to country independence. The proportion of population going into cities has come steadily down from over sixty per cent. to a little over twenty per cent. The gain is in the way of self-support; freedom from old world degeneration, and the wholesomeness of aloofness from the crowd. It is a distinct cause of gratitude, in this year of our Lord, 1903, that there is a steady growth of the homing instinct and of moral self-reliance. Fifty years ago literature laughed at the farmer as out of the circle of real life, but to-day nature books are as popular as novels. Our schools are beginning to teach agriculture as well as commerce; and farm boys are no longer told that success means escaping from the land and land culture

into commercial or manufacturing or professional life. Nowhere to-day is there such a rich intellectual life as can be led on homestead acres, with every science tributary to tillage—botany, entomology, geology, ornithology and chemistry, as well as mathematics. The new agriculture of the twentieth century involves more tact, skill, training and knowledge than any other occupation or profession.

For these reasons we do not agree with those that assert that the fundamental principles of the American Republic are passing out. Independence bids fair to reassert itself with increased vigor. This already shows itself, not only in country life and in literature, but in politics. Independence in politics is gaining ground. Some slight and temporary reaction may be expected; but "ripper bills" have for the past twelve months been out of sight.

Those who point to our experiences, that for the present seem to be less favorable to liberty, forget to give relative weight to counterbalancing conditions. The scandalous plundering in our Post Office and other departments at Washington is not what we need to emphasize to-day; but the fact, the great fact, that they are unearthed, exposed and punished. The American people has above all to be grateful that the moral sentiment of the present Administration has not permitted it to excuse or to shield the atrocious frauds, but has brought the full force of the President and his Cabinet into action to cleanse the political atmosphere. Never before in the history of the Republic has rascality had so poor a chance to hide in Washington as it has to-day. Clearly we are coming to a new view of political honor. The sway of the boss is by no means as strong as it has been. Mr. McKinley's fine statesmanship needed the sturdy craft of Roosevelt as a complementary supplement.

The drift is forward also in the struggle of labor and capital. The antagonism is lessened. We are distinctly entering a period when The Hague Conference is the symbol of social administration, not only between peoples, but between classes. One million of immigrants in a single year startles us, but it does not alarm any sane mind. New problems crowd upon us. We can trust

the public morals, social affairs, educational affairs, economic questions, involving millions of present expenditure, as well as the future character of the Republic, to the votes of those whose children will learn to speak the English language, and to honor the Declaration of Independence and the Constitution.

Our work as nation builders is not done; it is barely begun. For this also we may be grateful. Our Thanksgiving Day may rally us all into one great Church of sincere worshipers, where we call upon God to guide us, while we recognize the Providence that has heretofore not failed the Republic.

His Liberty of Dissent

WE do not care at present to comment at any length on the enforced resignation of Prof. J. S. Bassett from the faculty of Trinity College at Durham, N. C. He said something in *The South Atlantic Quarterly*—we quoted it—that did not conform to the prevailing white sentiment of the South about and toward colored people. That he ranked Booker T. Washington above distinguished white people gave particular offense. Such freedom of speech could not be allowed; the College would be boycotted. So, against the desire of the President of the College and some, at least, of the faculty, he was forced to resign. It is now to be settled whether the trustees will accept the resignation. That will be the supreme test of liberty of speech and thought in North Carolina. We recall that Professor Sledd for a somewhat similar offense was forced from Emory College, in Georgia. But he just slipped over the line into Alabama, and took a chair in another Southern Methodist institution, the Southern University at Greensboro, Ala.

As to Professor Bassett a prominent gentleman of Southern birth and residence writes us:

The morning paper says that Prof. J. S. Bassett, of Trinity College, has been forced to resign. If this be so, it is the worst disaster which has befallen the South since the days of reconstruction. I knew Bassett from his first coming to the Johns Hopkins as a graduate

student; he is a cool, cautious, conservative man, with a considerable vein of humor; an excellent, faithful and painstaking scholar; a man of broad intellectual views, and one who has been a most exact and efficient teacher. He will have no difficulty in obtaining another position north of the old Confederate States, but the fact is terrible in its import that a native Southern man of Bassett's careful and unaggressive mien cannot enjoy freedom of speech there.

The offense of Mrs. L. H. Harris, in daring to criticise Southern literary productions, is repeated in a more drastic way by Prof. Edwin Mims, a scholar of distinction, in the same *Quarterly Review*. Professor Mims treats of the literary South, and he asks "uncomfortable questions":

"How do the Southern statesmen of the present day compare with those of a former generation in progressiveness and breadth of sympathy and culture? How many ministers and editors are there in the Southern States who have national reputations or deserve to have them? How many highly endowed institutions of learning have we? With all our boasted universities how many really deserve the name? How many libraries, museums, art galleries, publishing houses, magazines, have we? To what extent is scholarship prized among us? Why is it that so many of our men of letters and scholars now live north of Mason and Dixon's line?"

"The South," says Professor Mims, "is a belated section." Criticism has been met by "boastfulness and self-glorification." He says:

"Sensitiveness to criticism is bad enough when the critic is some Northern man who writes what he thinks of Southern conditions; it is deplorable when the critic is a Southern man anxious to do service for his section."

He recognizes the good work of Southern writers, "of Cable and Harris, Page and Craddock, Johnston and James Lane Allen," but in Thomas Dixon he sees the very worst of the Southern art and spirit, its art "sensational, vulgar, commonplace" and the "envenomed fury" of its moral point of view. We commend the reading of this article to the ladies of the Georgia Federation of Women's Clubs, who hastened to attack a sister woman who had ventured mildly to criticise some Southern novels.

Prevention of Our Annual Holocaust

THE *Journal* of the American Medical Association, the official organ of the regular medical profession in this country and the representative of twenty-five thousand of the most prominent American physicians, has been conducting an investigation into the casualties incident to our present method of celebrating the Fourth of July. As the result of the collection of careful statistics it is announced that in 1903 there were 4,449 persons who were injured as a consequence of the use of fireworks. The fatalities numbered about 470. Among these there were sixty accidental deaths and 406 deaths from tetanus. Over 4,000 people were injured, more or less seriously. The injuries included ten cases of total loss of sight, 75 cases of loss of one eye and 54 cases of loss of legs, arms, or hands, with 174 cases of the loss of one or more fingers. This awful calamity list is the result of the supposed harmless fun of celebrating the anniversary of American Independence. It reads more like the list of dead and wounded after an important battle.

The medical societies of the United States at their fall meetings this year very generally took up with earnest purpose the problem of securing legislation and demanding the enforcement of at present existing legal enactments in order to lessen the number of yearly casualties. The legislatures of most of the States will meet within the next few weeks, and all those who are interested in contributing to the saving of life and suffering to a noteworthy degree should bring their influence to bear upon legislators and urge the necessity for giving this subject careful attention. Reprints of the articles published by the *Journal* of the American Medical Association can readily be obtained from the Chicago office, and they furnish all the data necessary to give such information as will surely make clear the crying need for prompt and effective legislative action in this important matter.

The statistics have been collected with extreme care, and no attention has been paid to the sensational accounts of newspaper reporters bent only on writing for

effect. No general statement has been accepted, and of the over 400 fatal tetanus cases the names, place of residence and the details of the injury inflicted, including the special form of fireworks that caused it, are recorded. Even with all the care exercised in the collection of statistics for the report, it seems clear that many cases were omitted. The fact that so large a city as Washington is represented by but one case of serious injury from fireworks would seem to show that awful as is the picture presented, it is by no means equal to actual truth, if the whole story were known.

The report brings out the fact that the fatal injuries are due practically to only two, or, at most, three kinds of fireworks, and demonstrates that the enactment and enforcement of proper regulations with regard to the sale and employment of these will probably save five hundred deaths and nearly ten times as many injuries at the beginning of next July. The most deadly of all weapons is the apparently harmless toy pistol, responsible for more than half the deaths—that is, over 200—from tetanus. After the toy pistol in fatality comes the blank cartridge. It is only a very little behind its supposedly more innocent rival. Besides these two, dynamite crackers and giant firecrackers are the causes of the most serious injuries, as well as such other slight wounds as are not infrequently followed by tetanus, with inevitably fatal issue.

Now would seem to be the time to make a determined effort for the purpose of ridding the country of the nuisance which the present method of celebrating the Fourth of July entails. We are glad to see that the Chicago City Council has forbidden the sale to minors of "any toy gun, toy pistol, toy fowling piece, or any other toy firearms in which any explosive substance can be used." But this, unfortunately, leaves it free for foolish parents to buy the murderous arms for their children. Surely no sane man will argue that the supposed cultivation of the patriotic spirit, which the celebration of Independence Day is supposed to give, is worth the sacrifice of five hundred young lives and the injury of so many young people. It is time to cease giving into the hands of the irresponsible youth between

six and sixteen years of age permission to do all the harm that is possible with the present use of pistols, firecrackers and other fireworks.

With the exception possibly of the manufacturers and sellers of fireworks, a are agreed that it is time to abate the nuisance. Next summer, when the Fourth of July is approaching or is already upon us, we shall hear much of the necessity for doing away with the dangers to life and property involved. Then it will be too late for effective action. Much can be accomplished if legislators are approached at the present time, and there will be many fewer little graves and many less anxious parents six or seven months from now.

Our Catholic Seminaries.

WE were very glad to report Archbishop Ireland's statement about the improvement within five years of the instruction given in the Catholic seminaries for the education of priests. Doubtless it was true, and yet there is another side, and there are still many incidents which show the difficulty in bringing up these institutions to the level of present-day thought, and the way that bishops and archbishops resist it, while others who know better have to yield to belated criticism.

Thus, if we are not mistaken, within five years Archbishop Ireland has dismissed from his own seminary Professors Shields and Danchy. Dr. Shields is a Ph.D. of Johns Hopkins, and held the chair of Biology. The complaint made against Dr. Shields was heresy, a frequent complaint against biologists. But Archbishop Ireland, we may be sure, did not regard the heresy as serious, for he supported Dr. Shields's candidacy for a professorship in the Catholic University at Washington, which was refused at first on the same ground, but afterward given. Dr. Danchy is a disciple of the Abbé Loisy, under whom he studied, and is perhaps the ablest Scripture scholar the Catholic Church has in America. Very likely his removal was a faint reflex of the troubles of his much persecuted master. Archbishop Ireland's watchful enemies would make too much capital out of the presence of Loisy's pupil in

the seminary. It may be that Dr. Danchy himself recognized this.

Within five years Dr. Bruneau, a Sulpitian professor in St. Joseph's Seminary, Dunwoodie, N. Y., was removed from the chair of Scripture by Archbishop Corrigan. He belongs to the liberal Sulpitian school of exegetes, which includes Vigouroux, Le Hir, Bacquez and Youszain. In explaining St. Luke he went so far that his pupils, ignorant of the subject, complained of him to the Archbishop, who had him transferred to the chair of Dogmatics. Within five years—indeed, in September of last year—Dr. Ayrinhee, another Sulpitian, was taken from the chair of Dogmatics at St. Mary's Seminary, Baltimore, and assigned to that of Morals. He is a brilliant scholar, who makes a deep study of modern English and American theological thought. Among the writers Dr. Dale, of Birmingham, is a favorite with him. He did not hesitate to tell his students at Baltimore that the story of Adam and Eve is a myth, and that auricular confession, as now practiced in the Catholic Church, is an offshoot of the Keltic Church; indeed, it is the one practice which the Irish Church fastened on the Universal Church.

Within five years, indeed last summer, Archbishop Farley gave orders that hereafter no seminarian of Dunwoodie should attend lectures at Columbia University. Under Archbishop Corrigan Dunwoodie was affiliated to Columbia, and several seminarians attended lectures in the halls on Morningside Hill.

Nevertheless, we believe that Archbishop Ireland was right in saying that there has been a "wonderful improvement" within five years in the Catholic seminaries of the United States, however much it has been resisted.

It will thus be seen that Protestant theological seminaries have no monopoly of the charge of "Heresy" which occasionally drives out their instructors. We recall, within a series of years something more than five, a number of similar cases in Protestant institutions. Among Baptist seminaries we may mention Louisville, whose removal of one professor enriches Harvard, and that of another Richmond College; also Newton, which dropped a professor of New Testament.

Among the Presbyterians, a Hebraist, forced from Princeton, has obtained distinction in Canada, and two professors in Allegheny were ostracized, while Union Seminary was dropped from the list of Presbyterian institutions for the heresy of its professors. Congregationalists do not forget what Andover suffered under this same charge, nor in the later years that a New Testament professor has been removed from Chicago Seminary for too much higher criticism, while Bangor's President held his position against sharp opposition. The Methodists also have had their troubles, as Boston University can testify.

Reciprocity with Cuba After a brief debate, and with only a few dissenting votes, the House has passed the bill without which the treaty of reciprocity with Cuba can have no force. This action should have been followed promptly by a concurring vote in the Senate. The approval of a majority is sufficient there now, and the treaty itself was ratified in the Senate at the last session by a vote of two-thirds. The election of new members since that ratification does not appear to have increased the number of those opposing the treaty. Old members have had their say; two days would have been enough for the speeches of new members, and the whole matter could have been disposed of before Thanksgiving Day, when the whole country could have rejoiced over this act of justice to Cuba and commercial profit to ourselves. Unfortunately it has been necessary for the Senate to yield to an unreasonable minority and defer the vote until December 17th. Those who regret this postponement may look forward with satisfaction, however, to final and favorable action on that date.

The Socialist Reverses The falling off in the Socialist vote at the recent elections in Massachusetts is significant, especially since it has been in Massachusetts that the Socialists have shown their greatest enterprise during the past few years. John C. Chase, of Haverhill, the first Socialist Mayor in the United States, running for Governor, received this year 25,222 votes, as against 33,629 last

year. The other votes for the Socialist candidates fell off in about the same ratio. This slump is accounted for in various ways, but the explanation that seems to explain most is that the party has now degenerated into a sort of Socialistic Tammany. Up to the present time, Socialism in Massachusetts was, as elsewhere, an educational rather than a political movement, but with the party's recent political successes their leaders have abandoned measures for men and, during the past campaign, strove almost entirely to strengthen their own political fortunes, paying little attention to the fundamentals of Socialism. We may add that there is not now a man in the Socialistic movement in Massachusetts of the caliber, say, of the late Henry D. Lloyd, and until the Social Democratic Party produces such a man there is no need of worrying much about our "brothers of class consciousness."

Admiral Evans Upheld The Secretary of the Navy has approved Rear-Admiral Evans's intemperate abuse of the Nicholson court martial, and so gone directly counter to the plain sentiment of the navy. The gist of his comment is in the following:

"It is considered that in this instance Rear-Admiral Evans has not shown himself unworthy of the continued confidence of the Department. On the contrary, in view of the evidence before the court, *without weighing too nicely the terms of his censure, it is believed that he was actuated by a high sense of duty and inspired by regard for the honor and welfare of the service.*"

The italics in this apologetic evasion are ours. There is some apprehension among naval officers lest a dangerous precedent has been created. Not the precedent, whatever may be the fact about the danger. The precedent will be found in a novel entitled "Higgins, an Autobiography" among the "Orpheus C. Kerr Papers," published in 1864. We quote, italicizing as before:

"After a short silence, Mr. Higgins took a chew of tobacco, and placing his hand on my shoulder, exclaimed:

"Why should I deceive you, girl? Last night I poisoned my only remaining sister, because she would have wed a circus keeper, and

scarcely an hour ago I lost two millions at faro. Your priests would say this was wrong, hey?’

“I stifled my sobs and said as calmly as I could:

“‘Our Church looks at the motive, not the deed. If a high sense of honor compelled you to poison all your relatives and play faro, the sin was rather the effect of vice in others than in your own noble heart, and I doubt not you may be called innocent.’

“He glanced at the fire a few hours and then said:

“‘Go Galushianna! I would be alone—Go innocent young scorpion—’

“Oh, Higgins, Higgins, if I could have died for thee then; I don’t know but I should have done it!”

Divorce and Remarriage

That the effort to have the Episcopal Church pronounce all remarriage after divorce, even of the innocent party, unlawful will meet serious opposition is illustrated by a curious case that has lately arisen and the comments on it of *The Church Standard*, of Philadelphia. The wife of a Mississippi Episcopal clergyman deserted him, went to another State, there obtained a divorce and married again. In the eye of the Episcopal Church her marriage was unlawful. Thereupon, after a while, her first husband married again, supposing he was justified, as she was guilty. But he had innocently made the mistake of overlooking the language of the present canon which allows remarriage only for the innocent party in a divorce obtained for the cause of adultery. What he ought to have done was to obtain a divorce in his own State for that cause after her remarriage, but it did not occur to him or to the Episcopal clergyman who married him. A charge was made against both clergymen for violating the law of the Church, but was not brought to trial. After a while the clergyman who performed the ceremony was called to a church in another State, and it was necessary for the bishop to mention, with the letter dismissing him, that there was this charge against him untried. Thereupon the bishop of the State to which he was called refused to receive him until the charge was withdrawn, which was done and clean letters given. This was a case in which the offense was purely technical, and *The Church Standard* is emphatic on the subject, and says that the man had a

right to marry, “unless our Lord’s judgment has now become obsolete.” We may be sure that the extravagant ethics of those who wish to stiffen further the present stiff law of the Church will meet stiff opposition in the coming General Convention.

The Municipal League

While it is undoubtedly true that there is a much more general interest in all that relates to municipal problems than existed, say, ten years ago, nevertheless it is equally true that the people of this country are far from realizing the true import of the mixed and complicated problems of our municipalities. This makes necessary the work of an organization like that of the National Municipal League, which at one and the same time constitutes an active educational force and propaganda. Its work in connection with drafting a municipal program, or, as it has popularly been called, “A Model Charter,” has won for it widespread commendation. We are informed that the volume containing the program and the papers explaining and justifying it have been used by every constitutional convention which has been held since its promulgation, and by practically every charter convention or commission which has been appointed since. Almost all its work in connection with uniform municipal accounting and statistics has been equally useful. Already the accounts of Chicago, of Boston, of the cities of Ohio, of Baltimore, Newton, Brookline and other lesser cities have been rearranged on its schedule. This does not mean that the systems of book-keeping have in every case been changed, but accounts have been made up along the lines of the League’s schedules, so that it is now possible to compare the cost of running those cities with reasonable assurance that the figures have been reduced to a common denominator. The League has also done notable work along the line of assisting instructors in the higher educational institutions in the matter of instruction in municipal government, and a committee has recently been appointed, with Superintendent Maxwell, of New York City, at its head, to study the whole question of instruction in municipal government in the second-

ary and elementary schools. Altogether the League has been carrying on a group of activities of the highest usefulness to the cities of the country. It has been earnest in advocating higher standards and effective in suggesting ways and means for improvement. It certainly deserves well at the hands of those who are deeply interested in all that relates to the welfare of our municipal population and yet who are unable to contribute directly of their own time to the movement.

Russia and China

It seems absurd that China, disorganized and weak, should think of resisting

Russia alone, as some of her most patriotic viceroys demand; but the time seems sure to come when the Yellow Peril will prove a peril indeed to Russia. China must not be looked upon as senile; she has simply rested in a long childhood which is coming to an end. Her people lack no stamina, and what was possible for Japan will surely one day be achieved by China, and then she will take her revenge on the nations that have robbed her of her territory. It is not to be expected that Manchuria will remain permanently Russian. The Manchurians are no Russians; their fealty belongs to China. It is reported that a Chinese army has entered Manchuria, and that a fight with the Russians has already occurred. Doubtless the Russians could now easily push the Chinese out of Manchuria, but conditions will be different even ten years hence, when the Dowager Empress is dead, and arsenals and navy yards are created, and Japan adds her fleet and her generals. The utter breaking up and partition of China seems the only way to escape the imminent future; and that is not probable, and, we will say, not desirable. Our own Government sides with China and Japan and Great Britain in the desire to preserve the integrity of China. Our request for the free port of Wiju, in Korea, just across the Yalu River from Manchuria, is a move to maintain the integrity both of Korea and China.

Religious Freedom in France

From our American point of view, which we believe is the correct point of view, the proposal of Prime

Minister Combes to introduce a bill absolutely forbidding the members of the religious orders to engage in any kind of teaching seems audaciously oppressive and outrageous. We think we understand the excuse for it, but it does not justify it. It is declared, and with much truth, that the orders are traitors, that they teach hatred of the Republic. Probably they do, many of them; they have not been very obedient to the late Pope. But this kind of procedure will not soften their feelings very much. It is in the line with the other laws which have succeeded in expelling so many bodies of monks and nuns from France. We doubt not that, as a body, the Catholic Church in France is disloyal, just as the officers of the Army, taught in youth in clerical schools, are disloyal, and would be ready, if a leader could appear, to overthrow the Republic and re-establish the Monarchy. Not long ago the French Minister of War visited the chief military school, corresponding to our West Point, and made an address to the cadets; but he could get no cheers, simply because he represented the hated Republic; the boys were Royalists. It is a bad condition, and requires radical correction of another sort, the abolition of the Concordat, independence of Church and State, and the liberty of all to teach. Then punish, if you will, on evidence, the teaching of treason.

President E. Benjamin Andrews gave a curious talk to some college men the other day, which he prefaced by saying that he was an optimist, and yet he added:

"There is no fear that our population will be too small, but much that it is losing virility. I hope President Roosevelt will take early occasion to amend his plea for swelling the census by urging quality of population as more of a desideratum, thus undoing a little the incalculable evil his recent words on this subject have wrought among the poor and thoughtless."

"Losing virility" indeed! Then there will be no need to oppose President Roosevelt's plea. That plea was not addressed to the "poor and thoughtless," who would pay no attention to it, but to the intelligent and well-to-do, to the better class of the population who ought to "swell the census."

In our last issue we referred to the recent conflict between a sheriff's posse and a band of Indians in Wyoming as being needless as well as disastrous. The outcome shows this to have been the case, for last week the Pine Ridge agent sent the following telegram to the Indian office:

"The nine Indians held on charge of murder of sheriff and deputy in Wyoming were acquitted—the Indian side of the fight not heard."

The following day word came that the Indians had been released from jail in Douglas, Wyo., and had taken the train for their reservation home in South Dakota. The incident is, therefore, "closed," but there remains bitter mourning in house and teepee over the seven killed and five wounded.

There are constant indications that Russia is not politically stagnant and that a strong party even among the governing class desires reform. To be sure, the Czar has to go to Darmstadt or elsewhere to learn what his people need, and just now his most intelligent adviser has been promoted into comparative obscurity; but the Czar has somehow learned enough of the massacre at Kieff to retire the Governor who was responsible for it, and he has received a report from a commission on the poverty of the peasants which strongly condemns their oppressions and declares that no reforms will do good without giving them education. Apparently the Czar is picking up some independence.

If Rev. B. Fay Mills, once an evangelist of the best sort, who left his membership with both Congregationalists and Presbyterians to join the Unitarians on account of his adopting their more radical faith, has now turned back to the work of an evangelist, his return should be welcomed and not resented. We do not know whether he has gone back to his old faith, but any kind of earnest faith needs earnest evangelists. Whatever the faith may be, if it attempts to teach men a radical turning from selfishness and sin to the love and service of God, in so far it does good, however weak and imperfect the motives it presents.

It is not in our province to take sides in a local difference over the succession to Miss Porter's famous school in Farmington, Conn. In behalf of the old school under Mrs. Robert Porter Keep is published the first report of the Advisory Committee, signed by Francis Goodwin, D.D., of Hartford; Miss Agnes Irwin, of Radcliffe College; Miss Annie B. Jennings, of New York; Prof. Thomas Day Seymour, of Yale, and Prof. J. Henry Wright, of Harvard. We give this old school, and also its rivals, our best wishes. There is room for them all. The women's colleges are crowded and the boarding schools overflow.

Senator Hoar's autobiographical volume discloses the fact that he was twice offered the post of Ambassador to England. In reply to President McKinley he declined the honor, among other reasons, because he could not afford the expense. The post necessarily involves a style of living which is far beyond what the salary provides. It is clear that the salaries of our Ambassadors and Ministers abroad are quite inadequate.

Vassar College is modest. While Columbia University asks for ten million dollars, and Harvard swallows four million without winking, and Chicago takes indefinite millions, Vassar asks for only one million; and, indeed, will be happy to get \$200,000 before June, to secure as much conditionally pledged by Mr. Rockefeller. She deserves all she can get.

Is not Theodore Roosevelt President of the United States? Is it decent that six leading labor delegates in Montana should be threatened with expulsion from Labor and Socialist organizations because they accept an invitation to dine with the President? Are the President's social courtesies to be used to the damage of himself and his guests, West as well as South?

General Thomas M. Anderson requests us to say that his article in this week's issue was not intended to influence the question of General Wood's confirmation.

Insurance

Insurance Frauds

THERE is a growing and perfectly legitimate sentiment against wildcat and bogus insurance companies that collect premiums but afford no protection in cases of loss. The ease with which a man without any sort of responsibility has been able to establish himself in furnished rooms and from thence to send out misleading and fraudulent circulars, which has had very recent exemplification in this city, is simply appalling. No wonder there is a revolt against insurance that does not insure. To combat abuses of this kind a committee of the National Convention of Insurance Commissioners was recently appointed. They were charged with the duty of presenting a memorial to Congress praying for action that should prohibit the use of the United States mails by unauthorized and irresponsible concerns. This was to have been accomplished by an extension of the anti-lottery laws. This committee has been prompt in the performance of its duties, and Monday, November 16th, a bill which had previously been submitted to the House was introduced in the Senate by Senator John F. Dryden, of New Jersey, President of the Prudential Insurance Company of America. The purpose of the bill is set forth in its title, which is as follows:

"To amend sections 3,894 and 3,929 of the revised statutes and other laws for the suppression of lotteries, so as to make them applicable to letters, postal cards, circulars, pamphlets and other publications concerning any business of and contracts and policies of life, fire or other insurance transmitted into any State, District or Territory by concerns or persons not authorized to transact such business in the State, District or Territory from which the same are transmitted."

Such a bill ought to and will doubtless receive not only Congressional but also popular favor.

Pullman Car Porters and Damages

THE United States Court of Appeals in Chicago has rendered a decision in

which it has been held that Pullman car porters are not entitled to damages from railroad corporations for personal injuries resulting from railway accidents. In view of the fact that many Pullman porters carry accident insurance obtained through companies making a specialty of this class of business, some of which have been writing it on the installment plan, the decision will have a widespread interest. Under the circumstances the outlook for the porters is by no means bright, as in the porters' contract with their employing company they are compelled to sign a waiver of claim for personal injuries against the railroad company.

It is now definitely announced that the scheme of Mr. W. C. Nones, of Louisville, Ky., for a mutual company to insure manufacturers against injury arising because of strikes, to which reference was made at some length in our issue of August 20th last, has been abandoned. According to Mr. Nones this has come about because of the general indifference of manufacturers, who, it would seem, should have been interested. There seems to be a trend in modern industrial life toward the strike as the most certain method of righting the real or fancied wrongs of labor, because of which there ought to be a considerable field for insurance designed to protect manufacturers from losses arising from strikes. Because the Employer Underwriters at the reciprocal exchange could not formulate a satisfactory plan of insurance in this direction it does not by any means signify, however, that some other concern cannot avoid the rocks upon which the Nones concern has split and establish a strike insurance that shall be mutually satisfactory.

....Norris Sutherland, Superintendent of Agencies for the Bankers Life of New York, is about to become Eastern Superintendent of Agencies for the Union Central Life of Cincinnati. Mr. Sutherland has our best wishes with the Union Central Life, whose business in the East is steadily growing.

Financial

Trade with South America

Secretary Shaw's brief address at the annual dinner of the Chamber of Commerce had for its subject the policy of subsidizing the American merchant marine, with especial reference to trade with South America, and the approaching construction of the Isthmian canal. The limits of our space prevent us from considering at this time the arguments for and against ship subsidies. It may be said, however, that a considerable and influential minority of the Republican party have not accepted the arguments in favor of them, that the Democratic party is in agreement with that minority, and that the history of the Atlantic Steamship Trust and the Shipbuilding Trust since what was virtually a rejection of the Hanna Subsidy bill in the House, has increased the force of the opposition which any subsidy bill must encounter. This, we think, is quite generally understood.

As for our trade with South America, it is certainly true that the development of it demands attention. But it is not clear that for this development the subsidizing of freight carriers is needed above all other things. Reports from consuls of the United States in South and Central America during the last ten years have continually pointed out what is required. Our exporting manufacturers have not diligently studied the needs and ways of South American consumers. They have not sought carefully to consult the tastes and preferences and traditions of the people. Relying mainly upon their domestic market in the States, and devoting their energies chiefly to that market, they have failed to compete successfully with European exporters who studied the South American buyer, intelligently catered to his wants, sent their agents to live with him, and paid due regard to all his demands as to credit and methods of doing business. We must profit by the example of European traders in South America if we are to become their successful rivals in that part of the world. And we must be willing to sell at their prices. Here there is an obstacle in the higher cost of producing many of our goods, due to higher

wages and the greater cost of certain raw materials that are subject to tariff duties. If we sell to foreign buyers at prices much lower than those demanded at home, our own people complain.

We must also be willing to buy as well as to sell, and to buy in a friendly way. There is in such foreign trade a law of barter that should not be ignored. For some years we have refused to accept treaties of commercial reciprocity negotiated with South American countries by our own agents. We have thus virtually repudiated a reciprocal treaty with Argentina. This alone is enough to restrain any development of our trade with that growing nation. There are several remedies to be applied, several other devices to be used, before we tax our people for freight subsidies to enlarge our trade with South America.

LARGE amounts of the Lake Shore General Mortgage seven per cent. bonds, due December 1st, have already been exchanged by Speyer & Co. for the same company's three and one-half per cent. gold bonds, due in 1997, which will be a first lien on the main line and other properties, and a legal investment for savings banks in New York and other States. The exchange is still offered by Speyer & Co. up to and including December 1st.

....The election of James Stillman, President of the National City Bank, to the New York Central board is regarded as indicating that the interest of the Standard Oil capitalists in that railroad company has recently been enlarged. Mr. Stillman takes the place of a Director who has represented the Vanderbilt interests, and he also becomes a member of the Executive Committee.

....Holders of the common stock of the Procter & Gamble Company have been informed that on or before January 2d next they will be entitled to subscribe for an additional \$750,000 of common stock at \$150 per share and at the rate of one share for every seven shares of the old stock.

....Dividends announced:

Harper & Bros. 1 per cent., payable December 15th.

The Independent

DL. LV NEW YORK, THURSDAY, DECEMBER 3, 1903 No 2870

Survey of the World

Field of
Politics

Ex-President Grover Cleveland, in a letter dated November 25th and addressed to the editor of the Brooklyn *Eagle*, announced his unalterable determination never again to become the nominee of his party for the Presidency. His letter was as follows:

"I have waited for a long time to say something which I think should be said to you before others. You can never know how grateful I am for the manifestation of kindly feeling toward me on the part of my countrymen, which your initiative has brought out. Your advocacy in the *Eagle* of my nomination for the Presidency came to me as a great surprise; and it has been seconded in such a manner by democratic sentiment that conflicting thoughts of gratitude and duty have caused me to hesitate as to the time and manner of a declaration on my part concerning the subject—if such a declaration should seem necessary or proper.

"In the midst of it all, and in full view of every consideration presented, I have not for the moment been able, nor am I now able, to turn my mind to the thought that in any circumstances or upon any consideration I should ever again become the nominee of my party for the Presidency. My determination not to do so is unalterable and conclusive.

"This you, at least, ought to know from me; and I should be glad if the *Eagle* were made the medium of its conveyance to the public."

The *Eagle* thereupon expressed its preference for Alton B. Parker, Chief Judge of the New York Court of Appeals, and it seems probable at the present time that the delegates of New York to the national convention will vote for him on the first ballot, at least. Much depends, however, upon the attitude of Mr. Murphy, the new leader of Tammany, who may obtain control of the delegation.

Judge Parker is regarded as an old friend of ex-Senator David B. Hill, whom Mr. Murphy dislikes, and whom he would not permit to take part in the recent municipal campaign. Judge Parker declines to comment upon Mr. Cleveland's letter or to discuss any political question. There is published a statement from "a close personal friend," who says:

"It is quite certain that he will not accept a nomination from the Democratic Party unless he agrees with its platform. Nor will he stir hand or foot to get the nomination. The honor must seek him. He will not seek it. He is not devoid of ambition, but he has no desire for honors that can be had only by striving or intrigue. He holds one of the greatest judicial offices in the nation, and is satisfied to stay there unless he is called to a greater office by the voluntary voice of the people."

Judge Parker's views as to national political issues are unknown to the public. Interviews with prominent Democrats in Washington and elsewhere show that little thought is now given by them to the candidacy of any one except Senator Gorman and Judge Parker. The opponents of Mr. Cleveland say that objections to a third term would have made his nomination improbable and his election impossible.—The conflicting policies or purposes of Senator Platt and Governor Odell as to details of party organization in New York have been the subject of much comment in the press. Following some indication of a contest between these two gentlemen, the Governor was invited by Mr. Roosevelt to confer at Washington with him and the Senator. The result of this conference is said to have been an understanding that the Senator should retain the title of leader, but that the Governor should really be

the ruling power. The President's rôle was that of a peacemaker. Governor Odell feels, it is said, that in Federal appointments and in respect to the controlling offices of the party organization he has been unjustly and unwisely ignored, and that the power of the Senator has been used to the injury of the party, whose prospects for victory in the State next year are not all that could be desired. The chairmen of the State and County committees, and the State's representative in the National Committee were selected by the Senator. It is reported that the Governor, as a result of the conference, will displace these officers and will seek to improve the organization in New York City, where the friends of the Senator are in control, and where, in the Governor's opinion, there is need of much improvement. Some say that the Senator had planned the re-election of Senator Depew in 1905, and that the Governor resented this premature disposal of an office for which he desired to be a candidate. The proceedings are regarded as important in their bearing upon national politics, some thinking that they foreshadow a sharp factional contest in the party in New York, and the loss of the State in 1904. There is no proof that the candidacy of Mr. Roosevelt is involved.

The New Republic
of Panama

General Reyes, the Colombian Commissioner, to whom his Government has given extraordinary powers, arrived at New Orleans on the 26th, accompanied by Generals Holguin, Caballero and Ospina. In published interviews he is reported to have said that Colombia could send an army of 100,000 men to the Isthmus if our ships would permit them to land on the coast; that they would go to the Isthmus by land if they could make the journey in no other way, and that his country would not go to war with the United States, because it was not able to contend with so great a Power. It appears that before leaving Colon he addressed a note to all the South American and Central American republics, saying that our ships would prevent the landing of Colombian troops; that there was no overland route, and that the representatives of these republics at Washington ought to confer with him

there and join him in friendly action designed to restore Panama to Colombia. He journeyed by rail from New Orleans to Washington, and was met there by two Commissioners representing the State of Bolivar, one of whom (General Jimenez) has published a statement urging the American press to point out the "injustice" of our course, to show that our business interests in Colombia will suffer by reason of it, and to let the American people know that Colombia can put 100,000 soldiers in the field. This country, he admits, would be victorious in the end (if there should be war), but only after "an enormous sacrifice of treasure and life." It has been reported that General Reyes would offer to make Panama the capital of Colombia, or would even suggest that the new Isthmian Republic should annex the remainder of the nation of which it was formerly a part. On the 28th he announced his intention to reach an agreement, if possible, with our Government by offering to grant the desired canal concessions and privileges without requiring the United States to pay even one cent for them. Cable messages from Minister Beaupré, at Bogota, say that up to the 25th no soldiers had been enlisted there, and there were rumors of revolt in Cauca. An American commercial traveler, arriving on the Isthmus from Cauca and Antioquia, asserts that a secession movement in both those States is supported by prominent men and several officers of the Government. Our Minister in Chile informs Secretary Ha that the Chilean people and press are heartily in favor of our policy, and that this is also the attitude of the Chilean Government. The approval of Chile was not expected, owing partly to that country's friendly relations with Colombia which were indicated by a secret treaty providing for the passage of Chilean troops across the Isthmus. Our Government's course is approved by President Castro, of Venezuela. The ports of Cartagena, Savanilla and Barranquilla have been closed against traffic with the Isthmus by the Bogota Government which has also given notice to the Canal Company that it will not permit a transfer of its concession and property to the United States. In Paris, last week, Foreign Minister Delcassé said to the Chamber of Deputies that before recognizing

the new Republic he had obtained from assurances that it would protect French interests and uphold all the concessions heretofore granted to the Canal Company.—An official copy of the new Canal Treaty has been sent to Panama by special messenger. At first the Junta decided to ratify it "as soon as received," and expressed this purpose in a message to Minister Bunau-Varilla. The understanding now is, however, that the work will not be done in one day. There is no opposition on the Isthmus, and it is expected that the treaty, ratified, will arrive in Washington by the 15th inst.

Congress and Washington Topics The Senate having agreed to defer action upon the treaty of reciprocity with Cuba until December 16th (in the regular session), the House leaders resented what they regarded as an attempt to defeat the purpose of the President, and therefore refused to end the special session. Successive adjournments for intervals of three days will prolong the special session until the beginning of the regular session is reached. In the meantime Speaker Cannon has been preparing his list of committee members. There have been a few speeches in the Senate, but the sessions have been short. Apparently there has been an abundance of time for the speeches in the treaty that have been deferred until the first week of the regular session. In a brief debate upon Mr. Newlands's resolution inviting the annexation of Cuba, Messrs. Hale, Lodge and D. H. Platt spoke in opposition, deprecating any movement that would excite suspicion in Cuba or appeal to the elements of discontent there. Mr. Hale predicted, however, that some of those present would live to see this annexation. "I am opposed," said Mr. Lodge, "to having island States." Mr. Teller asserted that Cuba, being a sovereign power, could at any time get rid of the restrictions of the Platt Amendment by revising or amending her Constitution.—The Commissioner of Pensions, Mr. Vare, permits it to be known that he intends to resign, several months hence, and resume the practice of law. It is said that his patience has been

tried by the continual criticism of those who ask for a very liberal administration of the pension laws.—Seven men in Louisiana, and eight in Georgia, were indicted last week for peonage. Among those so accused in Georgia are an ex-sheriff and a member of the Legislature. In Louisiana, the same grand jury brought in 220 indictments for stealing public land by fraudulent entries. Large corporations have induced farmers and others to make the fraudulent entries for their benefit. "So seductive has this method been in the hands of rich and unscrupulous men," the jury says, "that it has found victims in almost every walk of life. The farmer, the merchant, the lawyer, the doctor and even the ministers, have not been able to escape it."—At the hearing before the Senate committee concerning the case of General Leonard Wood, on the 27th, Major James E. Runcie, confidential adviser of General Wood when the latter was in Santiago, testified that the article in the *North American Review*, attacking General Brooke's administration at Havana, was written by himself at the request of General Wood and in pursuance of an agreement or plan made at a dinner in General Wood's house in Santiago (General Wood, Mr. Ray Stannard Baker and Major Runcie being present), with the understanding that the article should point out General Wood's success at Santiago and make comparisons with the work of General Brooke unfavorable to that officer. The testimony of Major Runcie had been awaited with some curiosity. The committee has summoned General Brooke.

The Postal Service Frauds

An abstract of Fourth Assistant Postmaster-General Bristow's report on the postal service frauds (which is thus reduced from 100,000 words to 12,000) has been given to the public, accompanied by a long statement from the President. Mr. Bristow's report sets forth in detail the history of the offenses on account of which four officers of the Department have resigned, thirteen have been removed, and forty-four indictments (involving thirty-one persons) have been

found. Many of the essential facts we have published in these pages from time to time, as they were brought to light. The name of Perry S. Heath (formerly First Assistant Postmaster-General, and now Secretary of the Republican National Committee) is mentioned in connection with several transactions. Superintendent Beavers was a subordinate of Mr. Heath, and a considerable part of the report relates to Beavers's crimes and reckless methods. The approval of Heath (formal or otherwise) was required for many of Beavers's purchases. He ordered the purchase of 527 automatic cashiers at an extraordinary price. In connection with this transaction Congressman Driggs (recently indicted) was bribed. The Washington agent of the company wrote to President Brandt: "I am sure that we have the friendship of both parties—General Heath and Mr. Beavers—and all that is necessary is to cultivate that friendship, if not by kind words, then by dollars and cents; and I think the latter will be the most positive." Mr. Bristow says:

"Eliminating from consideration all indications of fraud, and passing upon the case wholly as a question of administrative judgment, it appears to me that this transaction would have justified the summary removal from office of First Assistant Heath and George W. Beavers. But the element of fraud cannot be eliminated."

A company renting canceling machines to the Department employed M. D. Helm at Heath's suggestion, paying him \$1,200 a year, this being "a gratuity on account of his relations with Heath." Then the rent was increased. Other machines that had been offered once in vain for \$200 each were afterward purchased at \$300 (one hundred of them), and they proved to be worthless. There is evidence that their worthless character was known to Heath. In connection with one of Machen's purchases, 2,000 shares of stock were given to Beavers, who wrote, a year and a half later, to a representative of the selling company, inclosing 1,000 shares and saying that "our friend in Salt Lake" wanted the certificates drawn in the name of Edwin R. Bacon, who is Heath's uncle by marriage. After the beginning of the recent investigation these shares were returned to the company anonymously in a blank envelope. Mr. Bristow says:

"The evidence against Heath was submitted to the District-Attorney, who decided that it was not sufficient to warrant his indictment."

Judge George E. Baldwin, now Consul at Nuremberg, was interested in the sale of the automatic cashiers. "There is reason to believe," Mr. Bristow says, "that he knows as much about this fraud as any other party, not even excepting Beavers and Driggs." No new matter of importance appears in the history of the Machen and Tyner branches of the scandal. The thieves received about \$400,000, but the Government's loss far exceeded that sum.—A large part of the President's statement is a summary of the work of investigation. He heartily approves the recommendation of the Government's special counsel, Messrs Bonaparte and Conrad, that the term of the Statute of Limitations be extended in the case of Government servants, from three to five years. He remarks, however, that the prime need is not new legislation, but the punishment of the guilty. The cases against them, he says, "will be pushed with the utmost vigor."

"Every effort must be made to see that both the delinquent official and the outsider who shares his guilt are punished to the limit of the law. No crime calls for sterner reprobation than the crime of the corruptionist in public life, and of the man who seeks to corrupt him. The bribe giver and the bribe taker are equally guilty. Both alike sin against the primary law of the State's safety. All questions of difference in party policy sink into insignificance when the people of this country are brought face to face with a question like this, which lies at the root of honest and decent government. On this question, and on all others like it, we can afford to have no division among good citizens. Self government becomes a farce if the representatives of the people corrupt others or are themselves corrupted. Freedom is not a gift which will tarry long in the hands of the dishonest or of those so foolish or so incompetent as to tolerate dishonesty in their public servants. Under our system all power comes from the people, and all punishment rests ultimately with the people. The toleration of the wrong, not the exposure of the wrong, is the real offense."

The Fighting
in Jolo

Following the engagements on the island of Jolo in which more than 300 Moros were killed, General Wood attacked a force of insurgents in the hills near Taglibi, destroying a score of forts

and so punishing the enemy that no further armed opposition to American rule in that island is expected. In this engagement 75 Moros were killed, and General Wood lost but one man. As the Jolo Moros have heretofore been friendly, this outbreak has caused some surprise. General Wood reports that the Sultan is implicated and that his immediate followers were leaders of the insurgents. For this reason he holds that our treaty with the Sultan has been abrogated. It appears that for some time past the attitude of the Moros of Jolo and the adjacent small islands has been more or less hostile, and that they sharply resented the recent enactment of a law for the suppression of slavery. According to a report made in September by Major Scott, the Sultan has little power, and the prominent chiefs are brigands, who have been accustomed to enslave, without regard for justice, those who are accused of being in debt. A Moro who, with his family, has been enslaved for debt, may buy the liberty of his family by killing Christians. When he sets out to earn the liberty of his family in this way he is called a *juramentado*, and the acts of such murderous fanatics have so terrified the Christian residents and have caused so much loss of life that Americans have not been able to move about in Jolo without guards. The American garrison has been in a state of siege. Owing to the enactment of the law forbidding slavery and establishing new courts, General Wood and his troops were attacked when they landed on the island.

Santo Domingo The revolution has succeeded in Santo Domingo. As we went to press last week President Gil had just made the proposition to the insurgents that he resign and leave the Government of the Republic in the hands of a commission of four of his Cabinet, pending a final settlement of affairs. It seems that this proffer was unqualifiedly rejected by the insurgents, who thereupon prepared to storm the capital city of San Domingo. On the 24th ult. they began the attack, but they found no opposition to their advance, as President Wos y Gil and his Cabinet had fled to the protection of a German war ship in the harbor. United States Min-

ister Powell thereupon recognized and entered into negotiations with the *de facto* Government, according to his instructions from the State Department. It is not expected, however, that any request for the recognition for the Government *de jure* will be made for several months yet. General Jimines now becomes President of Santo Domingo. He comes of distinguished fighting West Indian stock, and has already been President of the Republic on two previous occasions. It was by his aid that Wos y Gil became President, when, during the temporary absence from the capitol of President Vasquez, who then was President, they succeeded in liberating five hundred political prisoners from the fortress of San Domingo City and with their aid seized the town and deposed Vasquez. It was at the time understood that Jimines was to be President as soon as affairs quieted down, but he soon fell out with Gil and had to flee to Hayti, where he became a plotter. Now his turn has come again. There has been some haste at Washington to disclaim any official connection with Minister Powell's warning to the turbulent people of Santo Domingo that their revolutions not only discredited their own country, but endangered the peace of the United States, and might, therefore, if continued, imperil the sovereignty of Dominica itself. Nevertheless, there seems to be a certain satisfaction in administration circles that Minister Powell said just what he did. One reason why Minister Powell is said to have uttered this extraordinary warning was because President Jimines told him that the insurgent Government, if successful, would not hold itself bound by any agreements already made by President Gil with foreign Powers. As President Gil had already entered into negotiations with Minister Powell looking toward the settlement of some of the American outstanding claims against Santo Domingo, it can readily be seen that Minister Powell did not wish to be compelled to take up and do all his work over again.

British Minor Wars	The British are seldom without a little war on their hands in some part of the world. Just now they are engaged
----------------------------------	--

in three such wars. One of these is in the Somaliland, East Africa, where they are trying to suppress the Mad Mullah. They have made great preparations to conquer this elusive foe, and have the assistance of the neighboring Italian colony. A little victory is reported, in which 380 camels and 2,500 goats were captured. A second war, in Southeast Arabia, is scarcely more than a demonstration to impress on the Arab chiefs that they must look solely to the British for direction, and must make no agreements with any other governments, especially Russian, for the alienation of any of their ports or territories. British Troops under General Martland have returned to Aden after a successful campaign in the interior. Lord Curzon, Viceroy of India, has returned from an imposing visit to Muscat, in which place he held a durbar with the chiefs, and impressed upon them the ascendancy of British interests and commerce. A Russian gun boat has been stationed permanently at Bushire to dispel the delusion that Great Britain exercises alone a decisive influence in the Persian Gulf and in Southern Persia. In Yemen the Turkish forces have been driven back by the revolted Arab tribes. The third more serious expedition is directed against Tibet, which has failed to carry out previous terms of treaty as to commerce, or to confer with Colonel Young-husband over Tibetan depredations. A large force is collected to occupy the Chumbi Valley, which is the key to Tibet. It is understood that this force will move in January, and will penetrate farther into Tibet than has hitherto been allowed. Tibet now feels independent of China, and does not at all modify its policy of absolute exclusion of all foreigners. It is likely that the British purpose is to anticipate Russian occupation. The Russians appear to be seeking an outlet on the Persian Gulf, through the Persian confines of Arabia, Russian influence being on the increase in Persia, while seeking to overcome the British preponderance of influence in Afghanistan. The branch of the Russian railroad which reaches the boundary of Afghanistan, and is within striking distance of Herat, is forbidden to all travelers. All passes

given for other Russian or Siberian lines specifically exclude this branch, as Mr. Sven Hedin found in his late attempt to pass over that line.

English Items

In a lecture last week Professor Sir William Ramsay, the famous English chemist, explained how the new element radium was transmuted into the element helium, as actually as the dreams of the old alchemists proposed to change lead to gold. Radium gives off an emanation, which acts as a heavy gas, which can be gathered in tiny flasks and weighed, and which shows the properties of radium, as if it were radium vapor. But in two days it begins to show the characteristic yellow spectrum of helium, which grows brighter and brighter, until after a week the spectrum of helium is fairly blazing with brilliancy. Thus we see radium transformed into helium; and this suggests that we may expect that other elements may in some way be persuaded to show similar transmutations. The price of radium has vastly increased, owing to the refusal of the Austrian Government to allow the exportation of the refuse from the uranium works at Joachimthal. The price is now \$250,000 for a fifteenth of an ounce. The hope of getting a supply from America has failed, as the ores prove to be worthless.—The marriage of Israel Zangwill, the author of "Children of the Ghetto," to a daughter of Prof. W. E. Ayrton, the distinguished electrical authority, attracts attention because the bride belongs to a Christian family, while Mr. Zangwill is a Hebrew, and one of the most active of the Zionists who are trying to establish a Jewish state in Palestine.—Two hundred members of the British House of Commons have had a most cordial reception in Paris, where they have returned the visit of a large delegation of the French Corps Legislatif to London. President Loubet entertained them at the Palace of the Elysée, and Premier Combes assured them of French goodwill, and that the recent treaty of arbitration between the two countries was generally approved, and was likely to be followed by other similar treaties with other nations.

Affairs in
France

It is officially announced that the Dreyfus case will be reopened. Minister Combes has examined the documents communicated to him on the subject by the Minister of War, with Dreyfus's application for a revision of his sentence, and has transmitted them for action to the Counselor of the Court of Cassation. It is understood that the Minister of War has found that two of the documents submitted to the court-martial at Rennes are forgeries, and fresh evidence is added.—A Yellow Book, issued by the Minister of Foreign Affairs, contains the correspondence as to the late arbitration treaty with England, and shows that the initiative was entirely with France, the credit belonging chiefly to M. Delcassé.—M. de Pressensé has presented to the French Chamber of Deputies an interesting report on the condition of Foreign Affairs. He notes as the most important events of the past year the understanding between France, England and Italy, which has been cemented by an exchange of visits of the two Kings and the French President, Loubet. This is not an alliance, like the Triple or the Dual Alliance, but it is an offset to the dominance of the alliance between Germany, Austria and Italy, and it makes for international peace. M. de Pressensé next mentions the treaty of arbitration between France and Great Britain, and expresses the hope that it is the beginning, which will find way to refer to The Hague the matters in dispute with Great Britain. He thinks the long difference with Italy was not so much due to the ill-will of Count Crispi, but more to the religious questions which harass the two countries.

The Prussian
Elections

The strongest political party in Prussia, the Socialist, has not been able, through the operation of an electoral law which Bismarck called the worst known, to obtain a single seat in the Prussian Chamber. In the election to the Imperial Reichsrath the Prussian Socialists cast 1,600,000 votes. The present Prussian law classifies voters by wealth into three classes, and a successful candidate must carry two of the three classes. There are cases in which only one man is in the

first class, perhaps a dozen or two in the second, and all the rest in the third. There are several cases in which there was no election, and in which the Socialists hoped to make an agreement with the National Liberals to vote for two of their candidates in return for votes for one of theirs.—The first encouraging reports as to the condition of the Emperor William after the operation to remove a polypus from the vocal cords have given place to renewed anxiety. He is forbidden by his physicians to expose himself to the air, and a second operation is planned. His journey to the Mediterranean has been countermanded, for fear of exposing him to the weather.

Russian
Affairs

The petition of the Finns, which was presented to the Czar at Darmstadt, seems, for the present, at least, to have had no good results. The action of the Russian Government in Finland is harsher than ever, and now, instead of banishing to foreign countries Finns expelled from the Grand Duchy, these exiles are now deported to Russia. The first case of this kind occurred on November 6th, when M. Hallonblad, ex-Mayor of Sordavala, was taken to St. Petersburg and thence to Viatka. He was allowed to travel to his destination by rail, paying the expenses both for himself and the two gendarmes who escorted him. The only cause known for the expulsion of M. Hallonblad is a personal pique on the part of the Governor of Viborg. The trial of the rioters at Kishineff is likely to be a mere mockery of justice. The indictment indicates that the agitation of the *Bessarabetz* was the immediate cause of the massacre, but denies any evidence of an organized conspiracy against the Jews. Yet it was clearly established in the preliminary inquiry that a number of educated people in the town were in the habit of meeting in restaurants with the editor of the *Bessarabetz* for some weeks before the massacre. The *Novoe Vremya*, the most influential newspaper at St. Petersburg, which has recently adopted a bitter anti-Semitic tone, considers it a grave defect in the prosecution that all the defendants are Christians, and tries violently to prove that Jews were the real instigators of the massacre. The array of counsel

for the defense and prosecution, to take place at Kieff, is the most imposing ever assembled in a Russian court; the whole number of advocates is somewhere between 80 and 100, and several of the best known Russian advocates have been retained by the better class of Jews. One thing is noticeable, there are very few damage suits brought by the Jewish sufferers for injury to their property; the whole number of these suits is only 50, whereas more than 1,500 houses were damaged during the two 'days' rioting. This fact is taken to show that the Jewish owners of property do not expect redress, even at this specially instituted court.—It appears now that the troops which Russia has been transporting to the Far East are intended quite as much to over-awe China as to prepare for any possible attack on the part of Japan. Two hundred and fifty thousand troops were ordered to the Far East at the beginning of the dispute, and more troops are constantly being sent to join them. At Mukden, the Russians make no attempt to conceal their reoccupation of the city, and are treating the Chinese officials with the utmost dignity. There is no conclusive settlement as yet of the dispute between Russia and Japan as to the occupation of Manchuria. Russia talks peace, but hastens on soldiers and vessels of war, and gives no sign of withdrawing from Mukden, the capital of Manchuria. Rumors are circulated that the two Powers have come to an understanding as to the predominance of Russia in Manchuria, but that she still refuses to allow Japan a corresponding control in Korea. Russia absolutely objects to the opening of Masampho, on the Yalu River, as a free port, on the ground that it is just opposite the region of her control, and she has sent a naval force there to back up her objection. Reports continue to be received of the growth of anti-Russian feeling in China. It is declared that the viceroys of thirteen provinces outside of Chihli, in which Peking is situated, have offered to send 90,000 foreign-drilled troops to oppose the Russian occupation of Manchuria.—There are constant accounts of political disturbances in Russia itself. These disturbances may hamper Russian policy in extending its borders in the far East.

The Balkan Provinces

Boris Sarafoff, the young Macedonian leader, is back in Bulgaria for the winter, and was received with the greatest enthusiasm by the Bulgarian population. The military movements in Macedonia are over for a season, but Sarafoff declares that they will be renewed in the spring, and in parts of Macedonia that have not been affected. There are such regions, and the Turkish authorities, recognizing that their absolute exclusion of correspondents has had a bad effect, recently conducted a party of carefully selected and trustworthy correspondents over such quiet districts, where they were allowed to see peasants peacefully gathering their crops and pasturing their flocks, who, under observation, assured them that all was as it should be, and that the Sultan's rule was most beneficial. Nevertheless, there are not less than 25,000 Macedonian refugees that have found safety in Bulgaria, and others are coming. These are in great want. The mother of Prince Frederick of Bulgaria has given her name as head of a Red Cross organization to aid the sufferers in Bulgaria and Macedonia, and two leading Bulgarians, Mr. M. N. Popoff and Mr. D. N. Furnajieff, have come to the United States to solicit aid through American committees. The Bulgarian Government has had great difficulty in avoiding war with Turkey over the Macedonian troubles. It would seem that a plot, similar to that which caused the death of the King and Queen of Servia, was concocted, and 140 officers were removed from their posts on its discovery. The Bulgarians could put 200,000 well equipped soldiers into the field. They are trained on the Russian model, while the Turkish army is trained on the German model, and a conflict would be of interest to military experts—only the British military methods have accepted the open formations of infantry forced by the Boer War. After the longest possible delay the Turkish Government has accepted, in principle, the imperative demands of Russia and Austria, backed by other Powers, for reforms in Macedonia, but no great trust is put in the execution of the scheme, altho the names are given of the Russian and the Austrian representatives, who will supervise the reforms.

The Government's Position on Panama

[The following article is written by a very prominent officer of the Government at Washington. It represents the views and the position of the Administration in regard to the Republic of Panama and the new canal treaty.—EDITOR.]

THE intelligent student of current events should not have been surprised by the appearance of the conditions which have made the Isthmus of Panama the present center of interest for the whole world. Merely the inevitable has occurred. From the moment the Colombian Senate rejected in bad faith and in a manner little short of contemptuous that notable agreement known as the Hay-Herran treaty, providing for the construction of the Panama Canal by the United States Government, the finger of fate pointed out the destiny of the Isthmus, and showed the pathway which the Federal Administration at Washington, actuated by principles of self-respect, common sense and duty to itself and its progressive sisters in the family of nations, could not hesitate to follow.

If we have done more than ultra-conservative persons had reason to foresee, we have not gone further, I trust, than a sense of duty, grounded on motives that do some credit to those who direct the nation's will, has compelled us to advance. Our course has been in accordance with common practice and established precedent, applied in the light of our specific relations of intimacy to the Isthmus of Panama. In taking the step which has made certain the resumption and the retention by the Isthmian people of their former independence, the Government has not merely followed an inclination that could not have been escaped, but has been ruled by the higher considerations of law and equity and its duty to civilization. From the moment that Congress designated the Panama route as the more feasible for a connecting waterway between the two great oceans, the Government had felt no doubt that the marvelous work that had so long been a matter of hopes and dreams was at last assured of accomplishment. How keen, then, was its disappointment and chagrin when, despite offers which it regarded as just and liberal, the terms making possible the construction of the canal were spurned

and rejected by those, or at least the representatives of those, who had for years importuned almost as a favor the powerful aid of the progressive republic of the North to make the Panama waterway a reality. The history of the diplomatic negotiations which ended so surprisingly is full of incidents reflecting credit upon the one, and nothing short of a lack of good faith upon the other party to them. To that spirit of cupidity which sometimes overrules the reason of even the wisest of mankind must be attributed, to speak the truth plainly, the misfortunes which have come to the present uncertain Government of Colombia.

Our peculiar interest in the Isthmus of Panama may be said to have dated from the proclamation of the treaty made with New Granada in December, 1846. By the terms of that agreement the Government of the United States was guaranteed the right of way or transit across the Isthmus of Panama and certain other privileges, among them

"that no other tolls or charges shall be levied or collected upon the citizens of the United States or their said merchandise thus passing over any road or canal that may be made by the Government of New Granada, or by the authority of the same, than is under like circumstances levied upon and collected upon the Granadian citizens."

In consideration of receiving the privileges mentioned, the United States Government agreed to make compensation, its obligations in that connection being set forth in these words:

"And, in order to secure to themselves the tranquil and constant enjoyment of these advantages, and as especial compensation for the said advantages and for the favors they have acquired by the Fourth, Fifth and Sixth Articles of this treaty, the United States guarantee positively and efficaciously to New Granada, by the present stipulation, the perfect neutrality of the before mentioned Isthmus, with the view that the free transit from the one to the other sea may not be interrupted or embarrassed in any future time while this treaty exists; and in consequence, the United States also guarantee,

in the same manner, the rights of sovereignty and property which New Granada has and possesses over the said territory."

It is plain from the terms quoted that the United States guaranteed to the Government of New Granada the neutrality of the Isthmus and rights of sovereignty and property which that Government possessed over the Isthmus. It is equally plain that the protection to be afforded by the United States to the Isthmus was against foreign aggression. In transmitting the treaty to the Senate, President Polk clearly set forth that idea when he said:

"The treaty was not proposed to guarantee a territory to a foreign nation in which the United States will not have common interest with that nation. On the contrary, we are more deeply and directly interested in the subject of the guaranty than is New Granada herself or any other country."

That was straightforward, unmistakable language. Mr. Polk not only brought out forcibly that foreign interference with the Isthmus would not be tolerated, but also that the interests of the United States in that narrow strip of land were paramount, not even New Granada herself having superior rights. As Mr. Polk, under whose direction the treaty had been framed, regarded its provision, so it has always been regarded, and the present attitude of the Government is a consistent adherence to the executive interpretation of nearly sixty years ago.

When, in the course of years, New Granada became the United States of Colombia, and later, when another change was effected through the abolition of the States and the establishment of the Republic of Colombia, so little was the matter of American guaranties of Isthmian neutrality regarded as relating to changes of the form of government and name (in effect, of sovereignty), that a new treaty with the Colombian Republic covering the question was not considered necessary, and the New Granadian Convention of 1846 remained in force. This fact should be borne in mind in settling any doubts that may arise as to the right of the United States to recognize the Republic of Panama while still adhering to its pledges of nearly sixty years ago to guarantee free transit over, and New Granadian sovereignty

of, the Isthmus. How firmly and consistently the American Government has adhered to the obligations then undertaken is shown from the records of nearly every Federal Administration. Within seven years after the treaty of 1846 was negotiated, Mr. Everett, then Secretary of State, did not hesitate to inform the Minister of Peru that if war between his country and Colombia occurred, the neutrality of the Isthmus would be maintained by the United States Government. How trustfully Colombia relied upon the good faith of this Government in maintaining the tranquillity of the Isthmus there is much evidence to show. Upon no important occasion did she fail to call upon the United States to fulfill the obligations imposed, and always to the benefit of herself. Expecting war between Spain and Peru in 1864, and realizing that her own commercial and perhaps political interests would suffer thereby, Colombia felt no compunction in asking the United States to carry out, in that event, the guaranty given in 1846. And again in 1885, when serious revolt confronted the Government at Bogota, it called upon the United States to keep the Isthmus free from disorder and prevent interruption of trans-Isthmian traffic. In no instance where such a call has been made has the United States failed to respond to it. There has been no sparing of expense or effort to provide for a proper fulfillment of the guaranty.

In every instance where the obligations which the United States so cheerfully and promptly met were imposed by Colombia, the benefit was directly to that country. Whatever benefit the United States may have received was indirect and intangible. But no question arose between them on the score of unequal compensation. This Government, having in mind the understanding that the Isthmus was being preserved from the consequences of political bickering in order that when the time arrived, if it were to arrive, for the construction of a canal benefiting the entire commercial world, no complications of an international character could arise to embarrass the realization of that gigantic achievement, did its work cheerfully and willingly, sacrificing the health and the lives of

those in its military service and spending the extra money necessary to maintain them under conditions approximating those of war.

Passing rapidly through intervening years of history, without comment upon the equities to which the United States became entitled through its virtually one-sided granting of material assistance to the Colombian Government in time of dire peril, we come to the more recent events that have developed a situation that is attracting the attention of all civilized nations. Through persistent effort, directed and conducted by Mr. Hay, Secretary of State, the obstacle which existed in the Clayton-Bulwer Treaty of 1850 to the construction by the United States alone of a canal across any part of the Latin-American Isthmus was happily removed, Great Britain withdrawing from the exercise of the rights granted her by that treaty to participate in the construction or control of such a waterway. Authority by Congress for digging and controlling a canal following the Panama route, with the alternative that the Nicaragua route might be chosen if arrangements for building the Panama Canal could not be made within a reasonable time, came in due course, and Mr. Hay negotiated a treaty with Colombia, which met with the approval of the United States Senate. Their devastating and enfeebling civil war ended, the Colombian representatives met at Bogota, supposedly to consider the compact into which their Executive had entered with the United States. Even before the National Congress began its sessions it was apparent that a bitter fight against the treaty would be made, but it was not then supposed that it would be conducted upon such lines as the opponents of the measure followed. Hints for more money were heard in Bogota. The United States was wealthy beyond the dreams of avarice. Why should it, then, seek to obtain the great privilege of building the Panama Canal for the miserly sum of \$10,000,000? And why should the Panama Canal Company (of France) keep all the forty millions promised by the United States? Why not make it divide with Colombia? These were the questions asked by

some opponents of the treaty at Bogota. They were effective questions. The treaty was defeated; it was not reconsidered before its expiration by limitation on September 22d. On October 31st the Colombian Congress adjourned, having accomplished nothing, and leaving as its heritage the certainty that it would lose one of its richest provinces and an interest in the great international waterway connecting the Atlantic and Pacific.

There have been accusations that this Government was implicated in the Panama revolt. These are based on the understanding that it knew the revolt was likely to occur. The accusations are false and ridiculous; the understanding itself has some foundation in fact. Even before the Colombian Senate rejected the canal treaty, it seemed apparent, not to the Government alone, but to everybody who had any interest in the canal question, that the Isthmian people would part company with the Colombian federation if the treaty were defeated. Unofficial reports to that effect came to the Executive Departments in Washington. But these reports were communicated also to the public press, and it is known that the Colombian Government was warned that arrangements for a separatist movement were being perfected by Isthmian leaders, to be put into effect if the National Congress failed to ratify the canal project.

Those who had to do with the defeat of the treaty realized too late that they had made the gravest error that had ever affected the fortunes of their country. They saw at last that the United States would not consent to extortion; that the people of the Isthmus, long-suffering, their territory exploited for the benefit of a section virtually foreign in thought and material interest, and separated from it by an impassable stretch of swamp, jungle and mountains, had reached the point where patience ceased to be a human possibility or a human virtue. Half frantic overtures were made from Bogota. Of them, Secretary Hay, in his statement written on November 6th, said:

"The suggestions which have been made to this Government since the failure of the treaty

in Bogota have been too vague and too extravagant to merit the serious consideration of the United States, and they were such as to create the impression on the minds of the people of Panama that there was no reasonable prospect of the accomplishment of the object upon which their hopes and desires had been set for many years."

The treaty was dead. No act of the Colombian Government could revive it. The chance, not of a lifetime, but of all time, had been thrown away, and promises, ludicrously inconsistent with the previous contentions of the necessity of adherence to national honor and the principles of the Colombian Constitution, could be of no avail. A more practical application of that alleged saying of an American statesman, "What's the Constitution between friends," could not have been given than was furnished by these tardy proposals.

Its efforts to secure the right to build the Panama Canal scornfully repudiated by those to whom this stupendous scheme would bring the most direct benefit, the Government of the United States might well have felt that it was entitled to abandon precedent and take forceful measures to regain what had been so rudely snatched from it at the very moment when the work of years seemed assured. But no such attitude was shown by any act on its part. It held its peace, waiting for the opportunity to place before the nation's representatives a statement of the situation with a view to having them advise the course to be pursued. Then, with a suddenness that startled the world, albeit the world had reason to foresee this very happening, the Panama revolt occurred. In promptly recognizing the new Republic—a Republic formed at the will of the vast majority of the people residing within its territory and brought into being without the firing of any except a few resentful shots from a retreating Colombian gun boat—the Government of the United States followed the instincts of justice and the demands of equity. Its course was neither unusual nor peculiar in according recognition to the *de facto* Government. Said Mr. Hay in the statement referred to:

"When it was reported to him (the President) that a Government had been established

and was working without opposition, he did what is always done under such circumstances. He directed our representative at Panama, as soon as he was certain that a Government capable of maintaining the public peace had been established by the consent of the people, that he was to enter into official relations with it."

The Government of the United States has recognized several other new governments more promptly than the Republic of Panama was recognized. As for the broader question of the application of our treaty rights over the Isthmus to the existing conditions, there remains no reasonable doubt of the duty of the President in the circumstances. Frequent political disturbances had threatened the interruption of Isthmian traffic and caused the United States to go to considerable expense to keep transit open. All that had been so often done by this Government in that connection had been for the benefit of Colombia, which had shown ingratitude by refusing the liberal terms offered by the United States in the canal treaty after that treaty had been made virtually at the frequent and earnest demand of Colombia. The Government felt that the Isthmus would never return to its allegiance to the central sovereignty. It had, in the first half of the last century, been, with the Province of Veragua, a separate Republic. When, in 1853, Colombia became a Federal Republic, with each component State having the right to resume independence at will, Panama and Antioquia had exercised that right for some years and had voluntarily re-entered the federation under the old condition. In recognizing Panama, the United States Government extended a welcoming hand to a sovereign State resuming its sovereignty, and having done so, it feels obliged to adhere to the obligations imposed upon it by the treaty of 1846 to keep the Isthmus free from disturbance to traffic. Said Mr. Hay:

"The name of New Granada has passed away; its territory has been divided. But as long as the Isthmus endures the great geographical fact keeps alive the solemn compact which binds the holders of the territory to grant us freedom of transit and binds us in return to safeguard for the Isthmus and the world the exercise of that inestimable privilege."

Adhering to that compact, the Gov-

ernment of the United States will refuse to permit the disturbance of Isthmian peace by Colombian troops which may be sent to regain the lost territory. In his instructions to our Minister at Bogota, informing him of the recognition of the new Republic, the Secretary of State explained this attitude when he said:

"He (the President) holds that the peaceable traffic of the world across the Isthmus of Panama shall no longer be disturbed by a constant succession of unnecessary and wasteful civil wars."

And even better, the case was set forth by Mr. Hay in a recent statement:

"Having regard only to the present crisis and the needs of the hour, no plainer duty was ever imposed upon a Chief of State than that which rested upon the President of the United States in the interest of the Isthmus, the people of Colombia, the people of the United States and the commerce of the world, to preserve, for the benefit of all, free transit over the Isthmus, and to do all that lay in his power to bring a permanent peace to its people."

Late dispatches from Bogota state that a condition of excitement, anger and disappointment prevailed at that capital, but the wrath of the people is directed, it will be found in the end, as it should be, against those persons who, from avarice and stupidity, were responsible for the summary rejection of the treaty. It must be borne in mind that the canal treaty was rejected without consideration and without debate. The responsible political party finds itself in a desperate situation. There will be resort to loud lamentation and formal protest. A vigorous effort will be made by the unfortunate and the guilty ones who are responsible for Colombia's present woes to "save their faces," as the saying is, by noisily complaining about the actions of the United States on the Isthmus. But this expression of displeasure is largely for political effect and will be without avail outside of Colombia.

If this country builds the canal the peace of the Isthmus and its opportunity for prosperity are assured. Peaceful transit to the whole world will be equally guaranteed, and the spectacle of an or-

derly, well conducted government on the Isthmus cannot fail to be a useful and suggestive object lesson to certain peoples who are much in need of such lessons and instruction. The United States will govern a wide "canal strip" and be paramount perhaps in the cities at either terminal of the canal. This Government will have the direction of all sanitary matters on the Isthmus, it is safe to assume, and the people of Panama will, I dare say, be glad of the opportunity to place these matters in the keeping of the strong, capable hands that wrought so well and achieved such notable results in Cuba in the warfare against disease.

The United States has followed its recognition of the *de facto* Government by recognition of the Republic of Panama as an independent State, and has negotiated with it a canal treaty, which will be sent to the Senate soon and which will no doubt receive the sanction of that body, for it is more favorable to the United States than the one rejected by the unhappy Colombians, and it does not seem probable that serious objection will be made to it save by those who oppose the Panama Canal or a canal by any route connecting the two oceans.

One can only commiserate the unwise and misguided Colombians, whose action in respect to the treaty, followed by the loss of the Province of Panama, will be remembered as the most impressive, salient and dramatic example of overreaching recorded in history. The realization of the great Isthmian waterway, the dream of centuries, seems to be at hand. Americans, indeed, the whole civilized world, should rejoice that when the time came for fateful and decisive action there was not established at Washington an Administration too faint-hearted and weak-armed promptly to strike the blow dictated by every reasonable consideration of justice, law, and the best interests of the whole world. In respect to its course in relation to the Republic of Panama, I am sure the Administration has no apologies to offer and no explanations to make other than a plain recital of the facts.

WASHINGTON, D. C.

Under Storm Sails to Bermuda

BY POULTNEY BIGELOW, M.A., F.R.G.S.

AUTHOR OF "WHITE MAN'S AFRICA" "CHILDREN OF THE NATIONS," ETC., ETC

IT was a turbulent sort of a topsy-turvy day at the tail end of March (1902) that I met my friend Tod hurrying out of J. Pierpont Morgan's bank in Wall Street. He looked happy and so I concluded that things were going well with both. We held on to our hats and shook hands. "Come along with me," said Tod.

"All right," said I; "what's up?"

"Yacht cruise!"

"Where away?"

"West Indies."

"When?"

"To-morrow morning, eight o'clock sharp, foot Twenty-fourth Street, East River. Tug 'Bainbridge.' Good-by!"

And so we skurried along like two Atlantic liners off the Newfoundland banks; we had merely time to exchange a friendly signal.

It was a rainy, misty, muddy sort of a start. We found one another at the end of the pier and the good tug "Bainbridge" puffed and snorted us down under the East River suspension bridge and past Governor's Island, the Bartholdi Statue of Liberty, to the "Narrows."

Tod should have been profane at this moment, for such wind as there was came from straight ahead, and the prospects were for a wasted day. But perhaps you don't know Tod? Well, he is about the size of Napoleon, measured lengthwise, and was also born with a genius for ruling others. But Napoleon frequently lost control of himself, and that is why I preferred Tod for yachting purposes.

When a man asks you suddenly to sail to the West Indies in the worst of winter months, and, moreover, informs you that he is the skipper as well as the owner, I venture to think that most of my friends

The "Thistle" at Rest in New York Harbor

would ask time to slumber on that proposition. It would take a more enterprising man than my little self to sail away with the average yachtsman, but when Tod said "come along," I did not hesitate. He might have asked me to take a motor across the Rockies, or a balloon trip to the pole, I should have packed serenely

and gone. But the Tod is a scarce animal—and only one of them can do this sort of thing. My Tod has carried off all the prizes worth having for riding steeplechases, he has been master of fox hounds, he is an artist in several different lines, from Wagner on the cornet to amateur photography. He is as versatile and energetic as the German Emperor; he can build his own boat, rig it and sail it; he has his certificate as master. For the sake of amusement he has a banking office, but the serious business of his life is navigation. *Navigare necesse est* is the German Emperor's dictum, with the corollary that a man may do without beer but not without salt water.

Tod is of the same opinion. During our week of stormy tossing in the Gulf Stream he never slept, nor did he eat more than ragged bits of ship's biscuit—at least, as far as I could observe. I could not stay awake all the time to see all he didn't do, but in my waking hours, for seven days and seven nights, Tod was always either in the chart room or on deck by the binnacle.

And was there ever a more adorable thing out of petticoats than our schooner? It was her maiden trip in deep water, and we were all deeply interested in her performance. It is from this "Thistle" that the Emperor modeled his new "Meteor." They are sister boats in all

essentials, tho that of Tod has been built with special regard to deep sea comfort rather than speed. Oddly enough, both stood their ocean tests at about the same time.

The "Meteor" was lying near us that misty morning, so what was more natural than for us to inspect her and take notes? She was nearly ready for sea, and was taking on stores of every variety; some from Germany, some from England and some from the United States. There was a genial international flavor about her decks. A British skipper, a few German officials, Yankee ship carpenters, mingled together, and all united in hurrying on the work, which I like to think of as a symbol of international good will. Cases marked Chicago, Kiel and London were being lowered at one hatch, while at another the American workmen were adjusting cleats and tightening lanyards. The German officials were discussing with the British skipper, and we of the "Thistle" were the only idlers—but we enjoyed it hugely.

Tod is a sly Spartan, who, while never eating or drinking himself, takes vast delight in gorging his fellows with baneful luxury; he chuckles when his thirsty guests slip under the table. But I had

consorted with the Scotch and was prepared for subtle wiles—I drank what Tod drank, and I fasted with him—now and then.

After a day spent with the "Meteor" and a night at anchor under the guns of Fort Hamilton, we finally got away from New York and headed for Bermuda, 750 miles due southeast of us, and every hour of it appeared to be in the Gulf Stream. Our portentous Scotch steward appeared to have learned most of his seamanship on the Erie Canal, for when the yacht commenced to swing and the table with it, he carefully lashed that swinging table, having reasoned it out that if the table could be made to stop its oscillation the ship would do the same. But reason on board ship is a dangerous substitute for deep sea practice—and, therefore, when the Gulf Stream came aboard it took the steward along and wedged him down in the leeward side of the main saloon with his legs in the air and a full set of dinner service on top of him, plus the contents of a soup tureen, an assorted collection of pickle jars, and the various sticky condiments that go to make up a table ready for three yachtsmen of alleged luxurious inclination.

The third of our cheery party was

The "Thistle" in Hamilton Harbor, Bermuda

The Deck

the commander of the gallant Seventh Regiment (National Guard, State of New York), the tall, broad, dignified, gentle giant—our beloved Colonel Appleton—the envy of every other regiment.

On board ship you mistake him for an admiral; on land for a field marshal. In his dull moments he illuminates the publishing house of Appleton; but on this trip he was entrusted with the delicate duty of representing the United States Army in foreign ports, and nobly it was done. To be sure we got no further than Bermuda, but many a coral reef will grow to soil before the memory of Colonel Appleton and his patriotic toasts shall have faded from that famous hunting ground of the British Navy and the grass widow.

Tod's portentous chief steward was the embodiment of New York's scholarly Bishop—if you can imagine our Reverend Primate with a very red nose and a husky Scotch brogue. It was surely this brogue which captivated our good Tod, for is it not an axiom of his nation that a drunken Scotchman is worth two sober Englishmen!

When the "Thistle" dipped her bowsprit into the Gulf Stream our steward dipped his into the brandy bottle; both

dipped deeply and at short intervals. Now the Gulf Stream is something like the sea serpent, in that all of us have seen it, but no one yet has been able to locate it. Wherever you may sail between Cuba and Norway you will find yourself inevitably tangled up in this strange hurly-burly current. On the map it looks tame enough, and of limited range, but once afloat it seems to reach out for you all over the North Atlantic. On the mail steamers the officers are trained to explain everything by solemnly assuring passengers that it will be all right "once out of the Gulf Stream."

But this is not a hydrographic essay—merely a reminder to would-be navigators that whether they sail off the coast of Spain, of Ireland, of Virginia, or of Newfoundland, they will find every freak of nature explained by reference to this soft, warm current, which is so delicious in the bathtub, but uncommonly discomposing when the wind runs counter, and you are in a little yacht of about 200 tons, whose deck is so close to the water that you might almost take a footbath by sitting on the channel boards.

On the second evening of Gulf Stream bobbling there came a sudden lurch, followed by a sound that suggested a lusty

goat confined against his will in a cupboard full of crockery. I remembered an expression current in my college days—"full as a goat"—and was not surprised when the door of a neighboring pantry opened and two children of Japan, most generally employed in the galley, appeared to inform us, in Oriental English: "Steward have got ice on chest."

I could have hugged their smiling, yellow faces in memory of happy hours spent in their lovely country, and we all were inclined to congratulate the steward and to recommend him to persist in his treatment. It proved, however, that the Japanese explanation was inadequate. The steward had not taken the precaution to protect his dishes or stores against the ship's motion, consequently, at the critical moment, he once more found himself down on his back, and a stomach piled high with plates, vegetable dishes, salt, flour, rice and jam pots. The ice chest had opened and discharged its load on top of the general wreck. Down below, between the blocks of ice, we could see the red nose of the helpless steward, who had to be helped, bellowing, to his berth. He was discharged at Bermuda,

with splendid testimonials!—a few more days of such stewardship and the "Thistle" would have had no stores or crockery left.

Ah, but that was a gusty trip, and—now that it is all over—a delightful one to look back upon. . . . We could never tire of watching the marvelous buoyancy of our little schooner. There were heavy waves following, threatening to come aboard and swamp us. The solid green mound of water loomed over our counter and we seemed to shrink to the proportions of a tourist under Niagara Falls, then—lo, as tho a great hand raised us from below, our stern floated up and the hissing, roaring torrent tumbled forward in a whirl of foam under the bowsprit.

The "Thistle" did heel—she went down on her side so that the green sea rolled in over the bulwarks, but after the first roll or two we came to feel as if nothing could take her to the bottom—she was a thing of life that could right herself under any conditions, so long as a steady head was at the helm.

We had thunder and lightning, and squalls and gales from every quarter;

Col. Appleton, Mr. Bigelow and Party of Bermuda Visitors

we had, in fact, all sorts of weather except the kind we seek on board ship. The "Thistle" was tested if ever a boat was, and my opinion is that under the command of Tod the "Thistle" is fit for anything, in any seas, from typhoons to cyclones.

One night our port boat was knocked clean up and out—along with the after davit. The two dragged heavily below the water line, and there was plenty of banging along side. Her shapely sides were sadly scarred—she seemed to shake herself as a buffalo tries to shake off a panther. The boat with her concomitant gear kept grinding and sloshing on the water line, while we scudded through the stormy night with never a star to wink encouragingly. We did nothing but heave up and down with a sizzling soda water sort of a rushing sound—only jib and storm trysail set, and our backstays strained to the uttermost.

The seas came aboard—down the companion way—flooding the cabin spaces, setting everything adrift that was not lashed. Our good ship heeled so many degrees that the official register went up into the fifties; we crawled about on all fours and lived like drowning rats, but it was glorious sport! We had unbounded confidence in our sober, silent, sleepless skipper, and we knew the "Thistle" could weather anything when properly handled. Uncomfortable it was at times, but now we look back with gratitude upon all the vicissitudes of that stormy trip. They gave us the opportunity of seeing the "Thistle" at her best—of seeing a good crew put on its mettle and of testing the practical seamanship of our skipper to the fullest capacity.

But weren't we glad when at daylight of a beautiful day, just one week from leaving Sandy Hook, we sighted the low bluffs of the eastern end of Bermuda, and took aboard a fat, black pilot, who proceeded to thread us through some ten miles of narrow channel between coral reefs to our anchorage opposite the hospitable Royal Yacht Club!

Bermuda is one of those geographical concepts which give the navigator immense trouble. It is so small on a chart of the great ocean that the superficial navigator is sometimes in doubt whether

it is a coral reef in his path or the misplaced deposition of some stray fly. Careful captains have sailed many days out of their course merely to keep clear of a piece of entomological excrement which, on a map, seems no bigger than the head of a pin. The fury of the storm carried the little "Thistle" some fifty miles beyond and to eastward of the island, for we approached it first at night, and feared trouble with those reefs which protect this important naval station better than do many batteries of big guns.

As we sailed into its beautiful harbor we could note that this was more than an international picnic ground—I counted about a dozen very modern men-of-war, in and out of dock, and forts enough to protect the heavy military stores necessary at that time. The Governor of Bermuda was then in charge of some 5,000 Boer prisoners, and these we could see strolling about the pretty little islets on which they were encamped, as we sailed slowly past. I had heard much of British cruelty—and even yet I find good friends in Germany and France who are distressed by the alleged sufferings of Boers in British hands. Let me assure them that the Boers in Bermuda were quartered and cared for in a manner to delight any sportsman who can appreciate salt water and lovely weather. They had army tents supplied to them and better rations than those served to the British soldiers who performed guard duty. They had all the clothing and blankets that were needful, were allowed to govern themselves through their own elected officers, and, in short, were treated with more consideration than any prisoners of war it has been my fortune to see or hear of in modern times.

I have seen Spanish prisoners in American hands; British and Kaffir prisoners in Boer hands; French prisoners in German hands—and, finally, Boer prisoners in the hands of the English. French prisoners who were confined in the fortress of Erfurt, during the war of 1870, complained bitterly at being refused white bread with their morning coffee, but had to be content with the sour, black bread to which their stomachs were not accustomed. When the Boers complained that the regular meat ration of a British soldier was insufficient for them

they were at once granted the increased or war ration. While we lay in Bermuda the British Government was paying day laborers four shillings a day on the new docks. There was plenty of work for those who wished it—so much so that Italian laborers had to be imported, altho the natives of the place are negroes. I did not see any Boers clamoring for work.

I met some of the officers responsible for the Boer prisoners, and I feel it my duty to testify that as a prisoner of war I could wish for no better fate than to fall into the hands of such gentlemen. When I saw the true state of the case I was naturally indignant at the calumnies which were so persistently going through the European press. Another illustration of the great need of an organ at the center of Europe, edited by a man who knows the truth, is not afraid to publish it, and, furthermore, has capital to pay for the truth. Such a paper would have sent its own representative to Bermuda and would not have repeated the falsehoods of interested parties.

Time slips pleasantly in this favored island. We had come to spend one day, to take in water and then sail away for the Bahamas; but we had reckoned without a knowledge of the place. How we ever got away from it, it is difficult to say, for the "Thistle," being a thing of beauty, naturally attracted to herself all that was beautiful in an island which seemed a shrine of beauty. The Governor and the Admiral commanding received us graciously, I found some old friends belonging to that gallant corps, the Royal Artillery, and there was such an interchange of hospitality between the "Thistle" and the shore that even our

gallant Colonel Appleton had his fluency taxed to produce, on each separate occasion, toasts capable of voicing our international concord.

There was a dance the first night, and the next the decks of the "Thistle" bounded elastically to the tread of a dozen of Bermuda's fair visitors. There were garden parties and tea parties, and dinners and lunches, and picnics and jymkanas, and water parties and races of all descriptions—the whole now a whirl of merry memory! . . .

When time was up the "Thistle" turned her nose homeward and slipped away to the northwest, past Government House, which sent us a farewell salute; past Admiralty House, where we wagged an answer to Admiral Bedford's friendly message, and so away to Fortress Monroe in Virginia.

Every day in Bermuda had been beautiful, but once at sea the storms and tumblings began again; but we had got rid of our Jonah—our portentous counterfeited of a bibulous bishop—so we laughed at the difficulties. It was uncommonly slow work heading against adverse winds and plowing through heavy seas, but we made our ten knots easily. The "Thistle" proved herself a model cruising yacht for the worst of deep sea trips, and is the kind to build if intent on a trip around the world. Every part of her has been thought out after personal experience by her skipper, and those familiar with yachts found infinite delight in noting the number of dodgy contrivances of his invention.

And here's to him—God bless him!—and may the next cruise of the "Thistle" count me in, in almost any capacity, from historiographer to assistant holystone.

MUNICH, GERMANY.

The Woman's Word About It

BY REBECCA HARDING DAVIS

TWO or three years ago a young college professor, whom a little learning had made mad, became anxious to know whether a human being, if treated from birth like an animal, would of himself develop a brain and soul? Would he, untaught, attempt human speech? Would his brain conceive, unaided, the existence of a God?

He resolved to try the experiment upon his own child. With his wife and the infant he withdrew to a lonely farm house in the Allegheny Mountains, and there remained for a year. The child never was permitted to hear the sound of the human voice; his food was thrown to him on the ground; he was not even taught to stand upright. At the end of that time the man and woman wearied of playing the rôle of animals; they packed up their belongings and went home. What became of them and the poor little Caspar Hauser afterward I do not know. So much of their story is true.

Their experiment seems cruel to you?

Yet we all are urged now to take part in a similar one. It is proposed seriously that in future American children shall be taught in the public schools no religion of any kind, nor even, some experimenters insist, any morality. The reviews and newspapers are filled with arguments pro and con. Every theorist has his word about it.

On one point all of these theorists are agreed—viz., that it is the duty of the State to fit these children for their future work in the world, and this work, with a singular unanimity, is conceded to be the pushing of himself, by each individual boy, on to success. The achievement of wealth, position and power. To "get on" is what each boy, be he Pat or Hans or Isaac, is told he has to do in this country, or be rated as a failure among God's creatures. And to enable him to get on he is to be instructed in history, geography, arithmetic—in every knowledge or craft which a citi-

zen can need from the collection of garbage to parliamentary law.

But we are told that he must never know that there is a divine code of laws for his conduct, that there is any unseen Power behind the awful mysteries of the world which confront him even in childhood; or that any messenger ever was sent out from the unknown to help him in his long hand-to-hand struggle with sickness or want or death, a struggle which will come to him whatever his rank or place in life.

In a word, if this scheme be carried out, the next generation of American men and women who have been trained in the public schools will be merely educated animals, with no higher motives in their work than the poor little monkeys on the street, who have been taught to dance to earn their living.

During the last two months many labored articles have been published by the advocates of this system. One ponderous logician insists that religious truths should not be debased by the daily direct teaching of plain men and women in common school rooms. They require, he urges, the pomp and dramatic effect of a church ceremonial to influence the mind of a young person.

He forgets that the leaven which has uplifted the world for ages came from the words of a poor peasant, wandering homeless through the wretched villages of Galilee.

Other excited writers tell us that it is impossible to give any religious teaching in the schools without provoking the ire of this or that sect, which fears that some tenet, not included in its own narrow creed, will be instilled into the minds of the children. We are told that the Catholics will not consent to the reading of King James's version; that Protestants repudiate the Douay translation with as fierce an antipathy; that the Jews rebel against the New Testament; while Anglicans, Baptists, Methodists and Calvinists are engaged in an angry conflict

as to what reading of certain contested texts shall be given to the children.

Hence, we are assured the only way to keep peace is to teach no religion nor morality at all.

Some of these objectors ask triumphantly why the moral and religious teaching of children cannot be left to their parents? To which the obvious answer is: "Why is not their training in arithmetic or geography left to their parents?" Which is more important, that a boy should know how to bound Borneo and to parse a compound verb, or that he should be taught to fear God and to keep his commandments? If the State cannot trust the parents to teach these minor scraps of knowledge, why should it leave the great essentials to their uncertain handling?

Cardinal Gibbons, the other day, offended that large proportion of our public whose creed is "Our country, right or wrong," when he declared our American public school system to be "vicious" in so far as it neglects religious teaching.

His Eminence, if he had taken time to go into the subject in detail, might have cited in support of his assertion the experience of England, a point heretofore curiously overlooked by all the heated contestants.

Religious teaching was neglected for several years in the English national schools, out of consideration for the jealousy of the adherents of the Established Church and the Nonconformists. After ten years, the reports from the penitentiaries and juvenile reformatories showed a startling increase of crime among children and youth. It was found that the free education which was intended to be the healing remedy for all vice and crime in the Kingdom had not healed nor removed one atom of either, but only changed their character. The ten-year-old pickpocket, by the aid of schooling, in which was no moral or religious influence, had become at twenty the intelligent forger or counterfeiter. He had gained from education skill and force for his evil work. But his work in life was no less evil. Why should it be? No effort had been made to uplift it or him.

In England, at the present time, religious instruction is included in the cur-

riculum of each school, but it is arranged that it shall be given at the beginning and end of the daily exercises, so that the children whose parents object to it can, at their option, be absent. If they grow up able arithmeticians and grammarians, but also depraved and vicious, the state washes her hands of all guilt in the matter. She offers instruction for the heart as well as the brain of the boy. The onus of guilt is thrown on the child's parents, if they refuse it.

Cardinal Gibbons, however, need not go to England for proof that the training of a child's brain alone, with no development of his moral sense, does not fit him for his place as a citizen. The reports of all of our State penitentiaries show that the large majority of their inmates have received at least what is known as a common school education. Their wits have been sharpened by it, but their aim in life has not been elevated.

The three R's never saved any man's soul.

The boy who has grown up with neither education nor religion is the man who sinks into the brute, who dies drunk in the gutter, or is lynched. But the boy who is given education without religion is the intelligent, skilled and more dangerous criminal. Education is our national Fetish. It is a beneficent force, if controlled wisely, but sometimes our worship of it blinds us to the fact that it needs control.

Cardinal Gibbons proposes as a remedy for the difficulty in our public schools that we should follow the example of Canada, where the funds for education are divided, and put under the control of the different religious denominations.

His Eminence forgets that while there are virtually but two religious denominations in Canada, there are hundreds, perhaps I ought to say thousands, in the United States.

If, as he suggests, the public school money should be placed under their control, every sect must receive its due, and the dozen disciples of each crazy Mother Anne or Miracle Working Mahatma, who claim to be inspired by the Holy Ghost, must have their portion of money and power as well as Episcopalians, Jews and Catholics.

Equally visionary and impossible are

many of the schemes proposed recently by the noisy objectors to religious teaching in the public schools. They turn this way and that in their frantic efforts to find something to take its place. The Bible must not be read, they assert, lest some disciple of Renan be offended. Christ must never be mentioned, or we may grieve the Jews; the Commandments and the Sermon on the Mount must be ignored, or the little followers of Confucius will have just cause for offense. Yet some of them are still rational enough to recognize the necessity for moral teaching. How is it to be supplied? How, when God, Christ and the Bible are wholly shut out from the knowledge of the children, can the principles and truths which they teach be sneaked into their minds? Under what disguises can they be made Christians in practice while they are kept in total ignorance of Christ?

One leader of these objectors feverishly proposes to teach them virtue by means of mathematics and machinery. The nice accuracy of steel screws and hinges, the inexorable facts of the multiplication table will, he thinks, lift them in time up to the heights of honorable and pure living. They should also be told of such men as Washington, Webster and other useful citizens and the part they played in the world. The great primal duties of life should, he suggests, be conveyed to them by the reading of Lincoln's Gettysburg Address, Whittier's Lyrics, and some of Wordsworth's Odes.

If the young agnostic philosopher who, as I told you, experimented on the soul of his baby, had put the child for life into a dungeon, where it never could see the sun nor fire, and then had tried to teach it what warmth and light were by penny tallow candles, he would have worked on precisely the same lines as this noisy theorist.

But it is time to ask, How long is this noise to continue? Is it a fact that the state will ignore in the training of the next generation of Americans both morals and religion? If so, who is responsible for it?

Are we to be the only people on the earth who give their sons and daughters no higher motive in life than expediency?

Even the cannibal on the Congo believes that an unseen something, bigger and better than himself, is hidden in a certain tree, and he will not hack at that tree nor burn it down.

But the American boy is to be taught to believe in nothing bigger nor better than himself—nothing which he cannot hack down or burn at will.

The mob in Paris that tore down the old altars and set up a naked woman for worship as the Goddess of Reason were saner than we, if we forbid our children to worship at all.

Who is it that forbids them?

Not the men who are known as the foremost educators in the nation. The report of the last National Council of Education stated emphatically that "Never in the history of the higher education has the religious spirit prevailed more widely or extended more deeply than at present," and that "never before in the history of college education have biblical studies occupied the place which they hold to-day."

The attack upon the teaching of morality and religion in the public schools is based upon a single argument, that "Religion is nothing if not sectarian," and that "no sect has the right to impose its doctrines upon the children of members of other sects."

Now, the curious fact in this matter is that the demand for the exclusion of the Bible has not been made by any religious denomination, but by a small number of noisy, would-be public advisors, who are for the most part outside of any religious organization.

And if you search still deeper for facts, you will find that the importance of dogmatic religion is growing weaker in every denomination with every year. The modern rational man, facing the awful instant problems of life, is not interested in squabbles concerning doctrines, which do not help him to solve these problems. He cares nothing for guesses about Hell, or the foreknowledge of God—guesses which no man ever did or ever can answer; or for the differences of opinion as to how water shall be used in baptism, or how congregations shall be governed, etc.

"These are outside, irrelevant matters," he cries. "Tell me of God, if there

be a God ; of Christ, if there be a Christ ; tell me how to better my soul here, or what chance I have to live again after I am dead."

In every sect men are growing more sincere and earnest ; they are searching for the foundation rocks of faith, and thrusting aside the non-essential froth of dogma.

The average American is this kind of believer to-day. He is not going to insist that this or that petty dogma shall be taught to his child in school, neither will he permit him to be brought up without the great foundations of life—religion and morality. He himself knows the value of both. He does not worry or quarrel, as did his grandfather, about predestination or the Immaculate Conception or pædo-baptism. But he has found in the fierce stress and struggle of this modern life a living God behind his daily temptations or hurts, who hears him when he calls, and who answers. He is not perhaps glib or positive in his definition of the Trinity, but in his care for his needy brother he carries out the teaching of Christ more fully than ever has been done in the world before.

This is the modern American. He is the majority—he is in power in this country to-day. He represents the mass of its intelligence, its common sense and its force.

It is he who will decide this question of the Bible and schools when it is fairly brought before him ; and he will doubtless bring to bear upon it certain plain truths which have hitherto, oddly enough, been overlooked.

The first is, the great basic fact, which we all are too apt to forget, that we are, after all, a Christian people. We are not Turks, Jews, Deists nor Buddhists. We are Christians. There is an incessant bewildering din kept up nowadays, it is true, by believers in other religions and non-believers in any. We have daily conventions and pronouncements from Theosophists and Mohammedans and Agnostics. We have thrown open our gates to them all ; they can come in and worship what god they choose. But we are Christians. We cannot rid ourselves of that fact any more than we can deny our white skins.

Our civilization, our laws, our habits of thought and of daily life, every stand-

ard by which we govern our actions, are the product, the development, of the teaching of Jesus of Nazareth. In proportion as we represent that teaching in our daily words or doings we are noble and fine men and women, and just as we misrepresent it we grow coarse and foul, go down toward the brutes.

This is not popular doctrine, I know. Many prophets, from Renan down to Mrs. Humphry Ward, have tried lately to belittle Christ, and to manufacture for us new systems of living. But not one of them has introduced a single rule or truth in those systems of life which has not been directly borrowed from the New Testament.

The rational American, whose common sense and conscience will try this matter, is not likely, too, to overlook the fact that the wordy Agnostic, who demands that the Bible be now banished from the public schools, except as a specimen of pleasing literature, owes all the freedom and security of his life to this same despised old Bible.

If he is able to sleep at night secure from robbery and murder ; if his wife and daughter, through all their pure and happy lives, have been kept apart from sin and stain ; if his boy—the child that is bone of his bone, and soul of his soul—has been urged upward every moment by his honorable surroundings toward decency, unselfishness and the noblest manhood, it is due wholly to the influence of the Old and New Testaments, in the country in which he lives.

This common sense judge will ask, What right has any American to deprive the coming generation of the beneficent influence which has done so much for us in the past ?

Has the foreigner such a right ? Because, as we said, we have opened our gates to all men to come in and worship God as they choose, are our children to have no God at all ?

For the men who would eliminate the highest truths from the education of these boys and girls, would, to put it in plain English, take them out of the life and development of the United States in A. D. 1903 and drop them back into the development of the Congo negroes.

No man has the right to forbid to any human being—not even to his own new born child—the chance of the highest

development which is possible in his country and in his age. Every child born in the United States claims so much from the nation.

Again, the matter-of-fact man, when called to decide, doubtless will remind us that the citizen who does not believe in God and Christ and the laws given to us by them is not allowed to disobey these laws with impunity. If he steals and murders he is promptly shut up or killed like a vicious beast.

Who has the right, then, to deprive the children of the knowledge of laws or the possession of principles which they must hereafter obey at the peril of liberty and life?

Pushing his inquiries still further in the direction of common sense, this plain man may remind us that every citizen pays a yearly tax to support the public schools in order that American children may be prepared for their lives and their duties as citizens. Before such a radical change in this preparation is made it must be submitted to the judgment of the whole nation, who pay their hard money for it. It is not to be decided for

them by wordy young essayists or lecturers.

However, our common sensed American will not probably be much disturbed in the matter. That the children of a moral, God-fearing nation should wilfully be brought up in ignorance of God and Christ and the ten commandments is too preposterous a scheme for his consideration. He will, very likely, agree with the alarmists that any phase of Sec-tarianism is a dangerous and belittling study to introduce into the public schools, and will calmly suggest that a committee of learned, sincere men of differing faiths be appointed to select such portions of the Bible for daily study as will convey to the child a knowledge of the God who gave him life, and of Christ, who came to teach him how to live. When the child becomes a man, he can study the grounds of petty sectarian differences and quarrel about them if he so choose.

The choice of this committee will not be difficult. There is more lofty piety, more common sense and sanity among Christians than the alarmists suppose.

PHILADELPHIA, PA.

Sir Henry Mortimer Durand

BY ARTHUR E. HOUGHTON

[Mr. Houghton is the Madrid correspondent of the London "Standard" and the Paris "Temps." His duties in Spain, where Sir Mortimer has been the English Ambassador for the past three years, make him especially competent to write of the new English Ambassador to the United States, who has just arrived in this country.—EDITOR.]

IN the recently appointed representative of His Majesty, King Edward VII, at Washington, are to be found all the characteristics that have made the gentlemen of England for centuries past in truth leaders of men,—the training in public schools and the softer influences of the home, the love of nature and the strong inclination for healthy field sports, the traditions of race and the religious feelings destined to exercise a lifelong influence, the sense of duty that is not incompatible with ambition, the gentleness and kindness to inferiors apace with the quiet self-possession and dignity of a chief, and last, but not least, the old-

fashioned truly English conviction that the best way to serve King and fatherland is to gather fellow countrymen together, shoulder to shoulder, in the battle of life. After being educated at Blackheath proprietary school and Eton house Tonbridge, the second son of the late Major-General Sir Henry Marion Durand, K. C. S. I., C. B., made up his mind to seek his fortunes in India, like his father and other members of his family before. Tho he came from a race of soldiers, his grandfather having served in the Peninsular War and at Waterloo, his father for years in India, young Henry Mortimer Durand elected to become a

SIR HENRY MORTIMER DURAND

member of the Indian Civil Service in 1870, and during his preparation was called to the bar at Lincoln's Inn in 1872, only going out to occupy a minor post in 1873. He soon was appointed Assistant Secretary to the Foreign Department of India, and then it was that he met and married in 1875, Ella, daughter of Mr. Teignmouth Sandys, of the Bengal Civil Service. The Sandys are an ancient Cornish family, who lived at St. Kevern in Cornwall since early in the fifteenth century. In the Indian Foreign Department Mortimer Durand learned the difficult art of dealing with the Indian rajahs and courts, and promptly was singled out for promotion. His first important mission was that of political secretary to Major-General Sir Frederick Roberts, the present Earl Roberts, whom he accompanied with the Cabul field force during the Afghan War. He was in action at Charasiah and saw some hard fighting near Cabul, for which he got the war medal and clasps. Later on the military instincts of his race led him to enter the volunteer corps of the Indian Civil Service, of which he became the colonel.

Late in the seventies he was appointed Under Secretary in the Foreign Department of India; in June, 1880, Private Secretary to the Viceroy; in 1885 Secretary to the Government of India in the Foreign Department, when he was barely thirty-five years old and fifteen years in the service. In this high position he attracted the attention of several viceroys, and became a friend of Lord Landsdowne. In the autumn of 1893 he was sent on a delicate and important mission to the Ameer of Afghanistan, when Russian intrigues and influence were spreading fast in Central Asia. Sir Henry Mortimer Durand (he had been made a Knight of the Indian Empire Order in 1889) was successful in establishing friendly relations between India and the Ameer, and in 1894 he was rewarded with a Knight Commander's cross of the Star of India.

In the few leisure hours outside official duties he had found time to write a work on the first Afghan War and a life of Sir H. M. Durand, his father. Lady Durand, too, some years later, published a very interesting volume of her reminiscences of Persia, where Sir Morti-

mer Durand was sent in 1894 as Envoy and Minister Plenipotentiary to the State. The Durands remained at Teheran from 1894 to 1900, and always spoke kindly of the ruler and the people of Persia, difficult as the duties of a British representative are in a country where Russian diplomacy and the Russian Intelligence Department are ever at work to undermine the prestige of the rulers of India. Sir Mortimer had acquired considerable personal influence, however, in Persia in his usual way by a patient, persistent, easy going, courteous policy, mingled whenever necessary with firmness and decision that soon impressed others that he knew perfectly what he was about in defense of British interests.

In 1900 the British Government appointed Sir H. Mortimer Durand Queen Victoria's Ambassador Extraordinary and Plenipotentiary to the Court of Spain. The same year he was given the Grand Cross of the Noble Order of Saint Michael and St. George, and the following year he was sworn in as a member of the Privy Council, which added the affix of Right Honorable to His Excellency's other titles and dignities.

It was, indeed, no easy task for the Anglo-Indian civil servant and diplomatist, accustomed to cope only with Orientals and with Muscovites, to find himself confronted by Castilians, still in the great majority of instances more rancorous against England than against the United States. When Sir H. Mortimer Durand arrived at Madrid in the autumn of 1900 public feeling in Spain was running high against everything English, because it was almost impossible to convince ninety per cent. of his Catholic Majesty's subjects that but for the attitude of the Government of Great Britain, especially of Lord Salisbury and Mr. Chamberlain, Spain might have saved, if not Cuba, at least Porto Rico and the Philippines. It is needless to add that this resentment was charitably fanned by Continental diplomacy at the time, encouraging the Conservative leader and Premier, Señor Silvela, to believe that the revival of Spanish power and prestige could be evolved from an alliance with France and Russia.

Sir Mortimer Durand entered upon his duties at the Madrid Embassy with the

fixed purpose from the first of improving the relation between the two countries by doing everything in his power to soothe the susceptibilities of the Court and its surroundings, of the Governments of the Regency of Queen Christina and afterward of the young King Alfonso XIII, and of Spaniards generally. During his three years' stay in the Spanish capital he carefully handled all British reclamations, all international questions, so as to create no conflict, no ill blood, and endeavoring to impress the Governments and the nation that England really wanted to prove that she wished to be their friend, and that their interests of every kind did not clash even in Morocco. This conciliatory action did not prevent the Ambassador from looking after British interests in a way that induced the British residents in their farewell and godspeed address to tell him:

"We value not only the admirable manner in which you have safeguarded British interests generally, but we especially appreciate the wide view your Excellency has taken of the duties of your exalted position. We have learned that anything affecting the welfare of British subjects is of importance in your eyes, and will be sure of a sympathetic hearing, together with appropriate treatment, if brought before your notice."

Well might the colony in Madrid thus address the Ambassador who had done so much to bring them together, at his hospitable gatherings at Christmas and the royal birthday celebrations, at the Christmas tree festivals and teas for English children of all ranks, at the meetings of the chaplaincy and benevolent funds boards, and who was present every Sunday at the little chapel services in Leganitos Street.

Englishmen appealing to the Embassy from the numerous British colonies in Spain found always a hearing and a gracious welcome. Nor must it be thought for one moment that Spaniards found fault with this *esprit de corps* kept up by the official chief of their Anglo-Saxon guests, as a prominent Spaniard, at the Madrid station, when he heard the three truly British godspeed hurrahs given to

Sir Mortimer Durand by his fellow countrymen, pithily remarked: "That union is what makes the 'strength of Los Ingleses.'" What the Spaniards of all ranks did like in the Ambassador were his manly, dignified and invariably courteous, kind manners. They appreciated his ways as much in their great official receptions, in balls and drawing rooms, as on the beach of Zarauz during his summer stay at that fashionable resort of the Castilian nobility. The Madrid aristocracy had got to be accustomed to treat as one of their own set the English gentleman, who rode out at least once a week on fine hunters with their fox hounds, or rode through the "Casa de campo," a royal domain, and in the Basque mountains and valleys around Zarauz with his frail, pretty, distinguished daughter by his side. The ground that he had gained in Spanish sympathies in so short a time was proven by the kindness shown him in the royal palace and on the day of his departure, all the more so as Spaniards are not wont to be demonstrative toward departing foreign diplomatists of any nation. He did not make any secret, nevertheless, that tho he liked Spain and felt grateful for the welcome he had met during three years, he was intensely pleased to go to America, as he had for years harbored the desire to see that country, even when never dreaming that he would be called to a post that he had not asked for. This is the moment to repeat what has been truly said of his appointment by one of his own cloth:

"We cannot tell if England requires in Washington a more consummate diplomatist, but if the diplomatist is to be combined with the gentleman, then Sir Henry Mortimer Durand is the right man in the right place, as that is what Americans are sure to appreciate most in King Edward's Envoy."

Shakespeare has a striking illustration of this Old World type of Englishmen:

"His years are young, but his experience old;
His head unmellowed, but his judgment ripe;
And in a word (for far behind his worth
Come all the praises I now bestow),
He is complete in feature and in mind,
With all good grace to grace a gentleman."

MADRID, SPAIN.

The Ballad of a Fore-and-After

BY THEODORE ROBERTS

WAR SHIP, schooner and barquentine—
The lobsters breed where their spars have been.
Top-sail schooner, and ship, and barque—
Quiet they lie in the haunted dark.
Dory and bully and brig—they swing
And break, where the dark sea-grasses cling.
They followed the sea. They found their rest
In her shifting arms—on her silent breast.

They built the "Nancy" in winter.
They launched her the tenth of May—
The best craft south o' St. John's,
An' the biggest in Witlass Bay.
Her sides were green as a garden.
Her hatches an' rails were white.
Her canvas was good hemp canvas.
Her spars were the best in sight.

Judson Pike was her builder,
An' owner, an' skipper, too.
Long Bill Pike was her bo'sun,
An' Foxy George was her crew.
Her cook was Elijah Thomas,
An' a low-down cook was he—
Sick from a sniff o' the bilge,
An' scared by a sight o' the sea.

He couldn't belay a halyard,
He couldn't haul on a sheet,
He always ran aft for the headsails,
An' he thought he could steer with his feet—
But he'd married the skipper's sister
A year back, Christmas Day,
An' that was reason enough
To ship him, in Witless Bay.

After a year o' sailing—
Trading, an' freighting supplies,
There wasn't a craft on the ocean
So fine, in her skipper's eyes.
She'd smell the rocks in the fog.
She'd crawl in the eye o' the wind.
She'd wiggle along in a calm
As if she were tailed an' finned.

At least, so 'twas said by Judson,
An' Long Bill Pike, an' the crew—
An' the cook, he looked at the skipper
An' swore to the story, too.
The skipper, he bragged about her
In town, an' along the coast.
There wasn't a craft could pass her.
That was his little boast.

He bragged in Fermeuse, an' Granby,
An' half o' the ports between.
One night he bet with the devil,
In Mother McKay's shebeen,
That there wasn't a fore-and-after
From either margin o' hell
Could show her heels to "Nancy."
That's what the gossips tell.

The "Nancy" was skimming south,
With baccy an' twine for the store.
Aport lay the slate-gray sea—
Starboard the buttressed shore.
The wind was steady an' strong,
Hitting her fair abeam.
She stepped from sea to sea
Tight hauled, with her paint agleam.

The skipper stood at the wheel,
An' he sang, as he held her over,
A song Bill Pike had made
Of a Bay Bull's girl an' her lover.
Out of the glare behind
Another craft drew down.
Her jibs were gray as the sea.
Her foresail was patched an' brown.

Jud Pike, with the tail of his eye
Saw her driving along,
An' a queer look came to his face,
An' he shut his mouth on the song.
He squinted up at the sails.
He spat at the lumpy sea.
"There don't live the craft," he said,
"Can get to win'ward o' me."

After the sun went down
The skipper, he lost his head.
"What's that light in her brows
Burnin' all smoky red?"
After the sun went down
The skipper's heart sank, too.
"What's that aft o' her fores'il,
Flickerin' thin an' blue?"

The stranger sped like a dream
An' passed to windward, an' then
Laughter went up from her decks
That wasn't the laughter of men.
Jud Pike, with death in his eyes,
Let the "Nancy" away,
An' crammed her into the rocks
Ten furlongs from Witlass Bay.

War ship, tramp and barquentine—
They lie, forgotten, beneath the green.
Top-sail schooner, and ship, and barque—
Unheeded, they rot in the crawling dark.
But men still quake at the awful laughter
That rings o'er the grave of the fore-and-after.

FREDERICTON, N. B., CANADA.

Finland's Fight for Freedom

BY ERIC EHRSTROEM

[The author of this article is the authorized representative in France of the Finnish patriots, now struggling to preserve their threatened liberties. Though a comparatively young man, Mr. Ehrstroem has taken an active and honorable part in the public life of Finland. A doctor of letters in the university and a graduate of the law school, he early became a member of the bar, and later filled the post of judge. His rôle in the preliminary stages of the present contest is touched upon in the following pages. Mr. Ehrstroem's father is one of the grand figures in Finnish jurisprudence. He was Professor of Criminal Law in the University of Helsingfors, a member of the Senate, and has been named "the father of the Finnish criminal code."—EDITOR.]

THE whole world was painfully surprised when the Russian Emperor, in his manifesto issued in February, 1899, dealt a deadly blow at the constitution of the Grand Duchy of Finland, and infringed on the laws governing the relations between Russia and Finland. This violation, on the part of Nicholas II, of the laws and liberty of the Finnish people, notwithstanding the promise made by him and his four predecessors on the Russian throne to defend faithfully and inviolably the Finnish constitution, awakened a feeling of sympathy for the little nation thus outraged. Thereupon, a delegation of six distinguished citizens of different countries of Europe, with Senator Triareux, of France, at its head and Nordenskjöld among its members, made the journey to St. Petersburg in order to lay at the Czar's feet an address, signed by 1,058 well-known names from all parts of the world, begging that justice be done to Finland. But neither the delegation nor the address was received by the Autocrat. And ever since, the Russian Government has continued, without a moment's cessation, to maltreat Finland,

abrogating her laws and setting up in the country an arbitrary *régime* which has spread everywhere terror and disorder. It is as if the Czar were at war with a nation in arms, which had been conquered but had revolted, whereas the Finns, while protesting pacifically and legally against this violence and arbitrariness, have offered no excuse for this abominable course on the part of their persecutors. And it is now more than four years that the civilized world has gazed with astonishment on this spectacle.

Conquered by the Swedes after several invasions in the twelfth and the thirteenth centuries, Finland accepted, along with the religion, the institutions and the laws of the victors. It formed an integral part of Sweden when, Russia having vanquished Sweden in 1808, Alexander I declared Finland, subdued by Russian arms, a part of his realm. Thereupon the new master in the following year assembled a general diet of Finland in the city of Borga, where he signed, March 27th, 1809, the following Act of Guarantee:

"We, Alexander I, Emperor and Autocrat

ERIC EHRSTROEM

of all the Russias, Grand Duke of Finland, etc., make the following Declaration: The Will of the Almighty having put us in possession of the Grand Duchy of Finland, we wish by the present Document to confirm and sanction the religion and constitution of the country, as well as the laws and privileges which each Order, in particular, in the aforesaid Grand Duchy, and its inhabitants in general, both great and small, have enjoyed up to the present time, in virtue of its fundamental laws. We promise to maintain all the privileges and the laws, in full force, without alteration or change whatsoever."

On March 29th of the same year the members of the different Orders took the oath

"to accept as legitimate sovereign the Very Lofty Prince, Alexander I, Emperor and Autocrat of all the Russias and Grand Duke of Finland, and to maintain inviolable the fundamental laws and the constitution of the country."

The Act of Guarantee quoted above was read at the moment of the ceremony in the cathedral of Borga and handed to the Orders, represented in the person of the Marshal of the Nobility. Then a herald proclaimed the Czar Grand Duke of Finland, and the

Emperor closed the proceedings with a speech which ended with these words:

"I implore the Supreme Being to give me the force and light to govern this worthy nation in accordance with its laws and in accordance with divine justice."

In accepting the fundamental laws of the country, the Emperor Alexander I thereby agreed to maintain the constitution contained in those fundamental laws, and definitely settled the exact situation of Finland in its union with Russia. The Grand Duchy enjoyed a large share of autonomy; it

was a state with its own constitution, accepting as its ruler the Russian Czar. This autonomy of this little constitutional nation lasted for ninety years. After Alexander I, the four succeeding Czars—Nicholas I, Alexander II, Alexander III and Nicholas II, the present ruler—all, on mounting the throne, repeated the formula of fidelity to the fundamental laws of Finland. Nicholas I, Alexander II and Alexander III, notwithstanding the periods of somber

reaction which characterized their reigns, did not touch the constitution of Finland. Even when Alexander II introduced his reforms and the Government changed its military system in Russia and decided to do away with the old military organization of Finland, the constitution of the country was not tampered with. According to the terms of the new law promulgated on December 27th, 1878, every Finnish citizen, while required to serve for the defense of throne and country, was under the command of Finnish officers from the

general down to the non-commissioned officer. The Finnish military establishment remained a national institution under the control of Finnish laws. But this did not prevent the Finnish troops from receiving the same military instruction as the Russian soldiers, from forming part of the same military organization and from fighting side by side on the same field of battle. So the Finns have never had but the friendliest feelings for this constitutional monarch. Since the beginning of the present conflict, his monument at Hel-

The Monster Petition to Which Reference is Made in the Article

singfors—see the accompanying picture—has always been decked with flowers and mourning, as a mark of respect for Alexander II and as a protest against the unconstitutional acts of his perjured grandson, Nicholas II.

Thus lived and prospered this little cultured land so long as the Government of the Czar laid no rough hand on its constitution and on its fundamental laws. But when Russian national life began to be poisoned by the retrograde spirit of Katkoff and Pobiedonosteff under Alexander III, a first blow was dealt at the constitutional rights of Finland. In 1891 the postal administration of Finland was subordinated to the Russian Minister of the Interior. This was contrary to the fundamental laws, which required that all the departments of the administration be conducted by officials subjected to Finnish laws. But even Alexander III, notwithstanding pressure brought to bear by Russian bureaucratic circles and by the Katkoff press and its acolytes, left the Finnish constitution intact.

The first years of the reign of Nicholas II were also, as regards Finnish affairs, calm, and Finland enjoyed regular government. The nation prospered and developed. But eventually, lending an ear to evil counsels, Nicholas II entered upon a course of perjury, *coups d'état*, and unfriendly measures, all affecting Finland. On July 19th, 1898, he issued a proclamation convening an extraordinary Diet at Helsingfors, the capital of Finland, for January 19th, 1899. The proclamation declared that the object of the convocation was to render

"the law of the Grand Duchy of Finland concerning military duty similar to that which, in this matter, prevailed in the rest of the Empire."

The bills submitted to the assembly removed, in military affairs, all the differences, legal and national, between the services in Russia and Finland. The Czar's Government knew that such a measure would meet with stout opposition. So before the proper committees, with which I was associated as secretary, could report on the proposed measures, the Czar promulgated on February 15th, 1899, a manifesto, with a series of regulations annexed, which

declared that henceforth the Diet would enjoy only a consultative voice in those matters which the sovereign considered concerned the common interests of the two nations. The Finnish constitution, the fundamental laws of the country and the act of Guarantee, solemnly proclaimed and recognized by five Emperors, were violated and abrogated *de facto*; for it is the Czar, conjointly with the Diet, who, according to Finnish law, legislates in Finland.

By his manifesto of February, 1899, the Emperor reduced the *rôle* of the Diet to that of a simple consultative body, and arrogated to himself alone all legislative power in all questions affecting the common interests of the two countries; in a word, he abolished the constitution of Finland, had recourse to illegal measures and established a *régime* of autocratic *bon plaisir*. For who is to decide what questions concern the common interests of the two countries? The Czar or his advisers. The future will show the lamentable consequence of this reign of the *bon plaisir régime*.

The Finnish Orders immediately took the ground and proved that as this manifesto was illegal, it did not have the force of law in Finland, and more than half a million Finns signed a monster petition to the Emperor, praying him not to cease to be the protector of their constitution. A photograph of this petition, which was united in bound volumes, accompanies this article. Refused by the Emperor, it is now deposited in the state archives at Helsingfors. At the same time, the committees of the Diet continued their labors and, in the hope of bringing about a mutual understanding, prepared the text of a new military law for Finland more in accord with that existing in Russia. But the Emperor would listen to nothing, and again signified his decision that this question should be regulated according to the illegal rules annexed to the manifesto, as explained above.

Along with this illegal act were perpetrated others of a similar nature. In the autumn of 1898 the Emperor appointed as Governor-General of Finland General Bobrikoff, who still holds the post, and who forthwith inaugu-

rated an administration of such arbitrariness and violence that, by the spring of 1900, the Finnish Orders found themselves forced to beg, in a special petition, that the Czar should put an end to some of the abuses which had grown up. But, as was his wont, Nicholas II made no answer to the petition, and Borikoff, naturally encouraged thereby, became still severer in his treatment of my unfortunate coun-

try, also protected as he was by the Minister of State for Finland, who, contrary to our constitution, is a Russian. I refer to the notorious M. de Plehwe, who was appointed in August, 1899. He it is who refers to the Czar all matters concerning Finland which require Imperial action. Since that fatal moment the Czar has always done whatever has been asked of him by these two nefarious officials, regard-

Monument to Alexander II at Helsingfors, as it Appeared on March 13, 1899, the Eighteenth Anniversary of His Death.

less of the best interests of Russia herself, as more than one good Russian is ready to admit.

I have just said advisedly "as more than one good Russian is ready to admit," for this very military law, which was the starting point of this whole constitutional conflict, when submitted to the consideration of the Imperial Russian Council, was viewed by the large majority of this high official body, composed exclusively of Russians, let it be remembered, in the same light as by the Finnish Diet. The proposition of the Minister of War was negatived by a vote of sixty to twenty! It was hoped and expected that the Czar would approve the decision of his Council, and thus, tho at the eleventh hour, the constitutional conflict with Finland would have been avoided. But alas! the Emperor sided with the minority of his advisers, with the result that the larger part of the Finnish army was broken up, our young recruits were sent to do service beyond the frontiers of their country, outside of the jurisdiction of our laws and under officers who do not know our language; while troops who, under the old law, would never have put foot within our borders, were quartered on us.

But it was not only in the military sphere that outsiders were thrust upon us. Russians, quite wanting in the necessary qualities properly to perform their duties, were placed in important posts. Thereupon, we Finns, a cultivated, peaceful and loyal people, protested pacifically and legally through our various public bodies—municipal councils, tribunals, journals and reviews—against these abuses. Then the Russian authorities began to suppress our periodicals and prohibit every kind of public meeting, to arrest our leaders and dissolve associations, to remove judges and banish—a punishment unknown to the Finnish statute book—our patriots. Exceptional and draconian powers were given to the Governor-General, who instituted violent measures of oppression, which are still in operation throughout the land.

I have just drawn up for the first time a complete list of prominent Finnish citizens who have been banished during the present difficulties. It in-

cludes nearly twenty members of the Diet, a half dozen mayors, four or five editors and three university professors,—forty-two persons in all up to the present moment, with the number constantly growing, drawn generally from the highest classes, both socially and intellectually. Among these was the regretted Dr. Lyly, a scientist of the greatest promise, who was studying abroad when the blow came, and who thereupon shot himself through sorrow and hopelessness, leaving a young wife to mourn him. But the widow of Dr. Lyly is not the only Finnish woman who has been in tears and in mourning since 1899. Nor will she be the last. For arrests, expulsions, the closing of business houses and all sorts of illegal acts are going right on at the present moment. One by one are being broken down all the mainstays of our national and constitutional life. The Russian has been declared the official language of Finland. If General Bobrikoff considers that public safety is threatened, he may make himself a sort of dictator. He does not hesitate to force intimidated peasants to sign addresses of congratulation to the Government, to bribe the weak and employ traitors to their country. Letters bearing the "mourning stamp"—a picture of one of these accompanies this article—alongside of the regular stamp are sent to the dead letter office. His latest act is not to suffer to be tried before the regular courts citizens guilty of not decorating their houses on the Czar's birthday and on other Russian national holidays; citizens who display the national flag or who take part in calling public meetings without the authorization of the Governor-General. Bobrikoff and his minions deal with such "culprits" by fining them 400 marks or imprisoning them. Thus the whole public and private life of Finland is at the mercy of this satrap whom M. de Plehwe himself is known to consider tactless and brutal.

But in spite of these violent measures and this new Reign of Terror, in spite of an occasional case of treason to one's country, an infamy which happens in all lands at moments of great trial, Bobrikoff and Plehwe have not been able to conquer the splendid moral

resistance of this noble little nation of two and a half million souls; and the result of this contest proves better than any high-flown dissertation that law and the spirit of liberty are stronger than perjury and violence.

One of the results, but not one expected or desired by the Russian Government, of this unfortunate conflict has been to strengthen the liberal opposition. Up to the present the Finns have always been faithful and loyal subjects of the Czars. They have never taken any part in the revolutionary movements in Russia, have not even sided with this liberal opposition; quite the contrary. Finland has ever opposed

the enemies of the present *régime* in Russia. But now, thanks to the blundering and cruel policy represented by Bobrikoff and Plehwe, the Czar has succeeded in turning a stanch friend into a bitter foe. Now every high-minded Finn, conscious of what is going on in his country, longs for the fall of autocracy and the triumph of liberty in Russia itself. We now perceive that the triumph of the cause of those who are fighting for liberty in Russia can alone succor us and restore to us our vanished liberty and our suppressed constitution. Thus results are produced that are opposed to the cruel and unfair ends which tyrants seek to attain.

The Finnish Mourning Stamp

PARIS, FRANCE

Self Neutralization in International Politics

BY PROFESSOR FREDERIC DE MARTENS

[The following article, by probably the greatest authority on international law in the world, and Judge on the Hague Court, forms a part of a longer essay, which will appear in the forthcoming number of the "Revue des Deux Mondes." M. de Martens has sent it to us in proof sheet, with permission to reproduce it in English.—EDITOR.]

UP to the present time the neutral position of small states has generally been a privilege created for their profit by the good will of the Great Powers. The perpetual neutrality of Switzerland, of Belgium and of Luxembourg is guaranteed by international conventions signed freely by the great states, who have desired such a guaranty of neutrality in case of danger. From this fact the conclusion is drawn that neither a single state nor a group of states has the right to declare itself neutral on its own initiative and without the express guaranty of the other states, especially without that of the Great Powers. Publicists of

the highest authority proclaim as an axiom that an act of netralization by a small state must necessarily be signed and approved by the Great Powers. This opinion appears to us absolutely inadmissible. In private life, no one will contest our individual right to declare once for all that we wish to preserve an absolute neutrality in the quarrels among our neighbors and acquaintances. In political and international life the same right ought to be recognized in states to declare *urbi et orbi*, and for all time, that they wish to remain outside of all international complications and to take no part in the conflicts among nations.

Thus Denmark has the incontrovertible

right to declare, of its own free will, its inviolable resolution to remain perpetually neutral, and to enter in no way into the conflicts between foreign Powers. The two other Scandinavian states, Sweden and Norway, have the same right, and also the right to unite with Denmark for the purpose of preserving their perpetual and common neutrality. A declaration made in this form ought to bring the same respect for the neutrality of these states, in the same measure and within the same limits, as if this neutrality had been guaranteed by the good will of the Great Powers.

In case of such a neutralization by the unilateral resolution of Denmark, only one thing could rightly be exacted of the Danish Government, viz., that it respect, itself, the obligations which derive from its perpetual neutrality. It ought to abandon every ambition to play a part in the great international politics. It ought not in any way to meddle with the affairs of other states, or grant to other nations—either in time of peace or, still less, in time of war—services which might compromise its perfect impartiality and its absolute neutrality.

The Danish nation, made neutral for all time, ought to devote itself exclusively to its own material and social progress. It would remain mistress of itself in its own territory, and it would continue to receive all nations with the same hospitality under the express condition that they submit to the laws of the country and respect, on their side, the perpetual neutrality of Denmark. In case of war between foreign nations, Denmark would have no need to declare solemnly her neutrality, and to exact from vessels which pass the Sound a respect for her perpetual neutrality. All nations would know, in advance, that this little country has nothing to do with the international complications which trouble the peace of the

FREDERIC DE MARTENS

world. Every accusation, indeed, every suspicion, of wishing to take part in the combinations of the Powers at war, would fall to the ground of itself; and, in a word, the neutralization of Denmark would be its defense and its refuge.

In this connection we take pleasure in citing the following words in which a patriotic Belgian, M. Lehon, explained to the National Congress of Brussels, in 1831, the advantages of the perpetual neutrality of Belgium:

"As applied to Belgium, this system tends rather to preserve her from the greed of the Great Powers than to restrict her in her own rights: her defense against every aggression remains intact; she enjoys the advantage of immunity from being dragged into any foreign war; she possesses a means of resistance against the exactions of the great states; she can employ a greater part of her resources to all kinds of amelioration and interior prosperity. Furthermore, as she is free in her commercial relations, even in time of war, so she is inviolable in her territory and attracts strangers by her guaranties of security. If neutrality is ineffective, like every treaty, in a

time of general conflagration, it is a protection in other cases against invasion and war; and in view of our own history, how can we fail to see its advantages for our provinces?"

The same considerations, if applied to Denmark, would show clearly all the profit which would derive from a status of neutrality. The conventional guaranty granted to Belgium by the Great Powers added very little to her privileged and enviable position. Nevertheless, the partisans of the prevailing opinion that it is only in virtue of a kind of donation on the part of the Great Powers that neutralization of a small state can be declared, take pleasure in affirming that a vountary neutralization, proceeding from the initiative of the state itself interested, would have neither practical results nor juridical value. It is absolutely necessary, they say, that the Great Powers create or confirm this neutrality for the benefit of a little state; and they cite as an illustration the neutrality of Belgium during the war of 1870. Let us see, then, just what happened, in 1870, during the war between France and Germany.

The sensational revelation made by Count Bismarck of the projected secret treaty directed against the very existence of Belgium provoked universal indignation through Europe. Gladstone stigmatized this "Treaty Benedetti" as "the most odious crime that had ever stained the pages of history." Public opinion in England demanded peremptorily that the Government should take the most effective measures for guaranteeing the neutrality of Belgium and for preserving her independence. The English Government shared these feelings, and, being convinced of the great importance of Belgium for the security of its own territory and commerce, entered into negotiations with the two belligerent Powers to obtain from them a solemn engagement that they would not violate the neutrality of the Belgian territory.

As a result of two identical conventions signed in August, 1870, at Paris and at Berlin, any aggression of France against Belgium was to bring about a union of the military forces of England and Germany to the end of preserving the integrity and neutrality of Belgium. On the other hand, any aggression of Germany against Belgium would mean immediately the united military opera-

tions of the English and French forces against the aggressor.

In this case, England only performed her duty as a Power guaranteeing the Belgian neutrality, and neither one of the belligerent Powers could raise the slightest objection against the solemn consecration of the state of affairs created in 1831.

However, let us suppose, for the sake of argument, that the treaty of London, of 1831, by which Belgium had been proclaimed perpetually neutral, had not existed. Under these circumstances would not Great Britain have had the right to act as she acted in August, 1870? Would not the English Government have possessed the right of declaring her firm resolution to protect the neutrality of Belgium against every aggression on the part of either one of the belligerent Powers?

Evidently, Great Britain, or any other neutral nation, might have taken the neutrality of Belgium under its generous protection. The treaty of London of 1831 furnished merely the conventional or juridical basis which would make the English operations accepted immediately in Paris and in Berlin. But the right of Great Britain to intervene, even without the treaty, would have been incontestable. Again, let us suppose the case that Belgium had proclaimed its neutralization in 1831, voluntarily, and without any international guaranteeing on the part of the Great Powers. It is none the less clear that in this case also Great Britain, or any other interested nation, in 1870, might have asked the two belligerents whether they had decided to respect its neutrality, and, in case of an affirmative response, might have proposed the conclusion of an agreement similar to that of 1870.

In every conceivable case the essential matter consists in the existence, generally recognized, of Belgian neutrality. That is the positive fact which took all offense from the resolution asserted by England that she wished to protect the neutrality of Belgium for her own account. If this fact had not existed, if the Belgian Government had restricted itself at the commencement of the war of 1870 to a proclamation of its neutrality *ad hoc*, doubts of the genuine character of this neutrality would have been possible and perhaps

legitimate. A Power which proclaims its neutrality only when a war breaks out may very well have pursued up to that moment a policy hostile to one or the other of the belligerents. In such a case, the belligerent government whose interests had been injured would be slow to admit that, by a simple proclamation of neutrality, all responsibility could be waived for anterior acts.

So the conduct of England in the war of 1870 proves beyond cavil the absolute necessity and the great advantage of the neutrality of small states. But it does not follow from this fact that the willingness of the Great Powers to declare the neutrality of a small state is the only source for such a state of this peaceful and privileged position. The true source of the neutrality of a state lies in its geographic position, its history, its interests, and, above all, in its firm determination to preserve this situation at any cost.

To apply this consideration to Denmark, we would say that it has the incontestable right to proclaim its perpetual neutrality by a declaration addressed to all the nations of the civilized world. In all probability several of the Powers would make haste to assent to such a declaration emanating from the sovereignty of the Danish State. In case of war, the Powers which have the greatest interest in the Baltic Sea, and which can

never permit Denmark to be conquered or the key to this sea to be taken violently from her, would be quick to lend their generous and effective protection to a neutral Denmark.

It is probable that some Power would be found on the banks of the Baltic Sea ready to follow the example given in 1870 by Great Britain on the shore of the North Sea. If the neutrality of Denmark were then an actual fact, such assistance would be the performance of a duty and the effective affirmation of a right. If the neutrality of Denmark were proclaimed merely *ad hoc*, in case of war already declared, the assistance of a protecting Power would then become an act of politics and a combination or alliance against the common enemy.

A small state which only desires to live in tranquillity and in peace ought to take every possible precaution not to become a sport in the great game of international politics, which crushes more often than it creates.

Such are the conclusions which seem to us dictated by common sense. "Common sense," said Guizot, "is the genius of humanity." Unfortunately, the sad experience of life teaches us that this "genius of humanity," even if it reigns, does not always control the ideas and actions of men.

The Congo Free State Courts

BY THE REV. W. M. MORRISON, D.D.

[When Dr. Morrison returned to this country from his mission station in the Congo Free State, he wrote an article entitled "The Misgovernment of the Congo Free State," which we published in our issue of July 9th. Since then the situation in the Congo Free State has excited the pity and indignation of the civilized world.—EDITOR.]

WITHIN the past few months most astonishing facts have been published to the world regarding the atrocious ill treatment of the native people by the Government of the Congo Independent State. These statements have now come from so many reliable sources—from missionaries, traders, travelers, and even Government officials—that the world is no longer in doubt as to the facts concerning the re-

volting and disgraced system of slavery now carried on there by the King of Belgium, and done, too, all the more shame, in the name and under the guise of philanthropy.

Since these facts have thus been brought to light, King Leopold at first flatly denied that any such atrocities had been committed. When he found that such flat denials would not satisfy the public, he proceeded to give explana-

tions, the most remarkable of these explanations being that he thus forced the helpless natives into military and labor service in order to civilize them. This explanation may perhaps satisfy this heartless and conscienceless King, who has as result of this forced labor and military system become the largest dealer in ivory and rubber in the world, but such an explanation will not satisfy the Christian civilized world when it is remembered that this system of government necessarily results in untold cruelties and injustices toward the native peoples.

A favorite method the King and his Government have of blinding the public to the true situation there is to say that all cases of cruelty to the natives are carefully investigated by the courts in the country and offenders are invariably punished. This seems a very strong argument and it is the purpose of this article to show from my personal experience with this matter in the Congo State courts that so far from justice being done, these so-called courts of justice are only used as veils with which to blind the eyes of the world to the awful scenes of cruelty, oppression and often of bloodshed which are being enacted in that unfortunate land. It is a most deplorable state of affairs in the administration of the government of any country when the courts in that country cannot be trusted to do justice, and this is especially true in a country like the Congo Free State, where the King of Belgium has absolute control and the natives have no appeal from the decision of his courts.

To clearly see that it is absolutely impossible to get justice done in such courts it is only necessary to state that all the officials in charge have been appointed by the King and sent out as his tools, and they know full well that it would be all their positions were worth and perhaps their heads, too, if they insisted on giving justice to the native people in opposition to the system of oppression and slavery which the King has set into operation there.

It is a fact, however, that the Government officials there are not to blame for the cruelties; they are only acting under orders from superior officers, and the supreme officer is the King himself. I have there made complaint to the Gover-

nor himself regarding his under officials, who were scouring through the country, catching men by force to be made into soldiers and laborers. The only answer I could get was that the official was acting entirely within the law, that the State had a *right* to *force* men into service. Of course, the so-called courts can do nothing and will do nothing for the relief of the natives under such circumstances.

I shall only give one or two out of many illustrations which I could give of the working of the Congo courts. There had been a terrible outrage committed near one of our mission stations. According to the usual custom, a gang of State people, from the State post at Suluabourgh, came near to one of our mission stations. Of course, they were sent by the State official at that post, were given guns and all necessary ammunition. They went out on a raiding expedition; they killed many innocent men and women. One of our missionaries found them with a large number of human hands drying over a fire, and the leader of the expedition said that these hands were to be taken back to his white State officer to show that his work had been well done. In the name of our mission I reported these outrages to the King in a personal letter to him. A judge came to investigate the charges I had made. The decision was rendered that the white official had nothing to do with the matter and the people who made the raid were never punished. No one, up to date, has ever been punished or ever will be punished for that awful outrage—and that is only one of many such outrages which have been committed and are now being committed in the Congo Free State. The King of Belgium is always hypocritically proclaiming to the world that he wants the report of such injustices, so that the perpetrators can be punished. It can be easily seen that he is not concerned as to results when he knows that the courts will never render a decision contrary to his will. Occasionally a subordinate official is punished and kept perhaps for a few months at Boma, and great capital is made of this, but I defy the State to point to a single man in high official circles who has ever been punished, for they, including the King himself, are

really the guilty ones. It is not reasonable to suppose that a man is going to punish himself.

I shall mention only one other case. Something over a year ago a white State official came to my station at Luebo and there, after my extracting from him the promise that he would take no one away by force, he caught in the forests, where the poor natives had fled for safety, eighteen men, and I saw these men taken away with ropes around their necks. Terror had reigned in our section for some months. I reported this situation of affairs to the Government. A judge, as he was called, came to investigate the charges I had made. It could be easily seen all the way through that it was his purpose only to take down such evidence as he wanted in order to free his fellow official, who had ordered the raid. The witnesses were examined in secret, tho I bitterly protested against such manifest trickery and injustice. The evidence thus obtained and left in the hands of this official unsealed was sent on to Boma, where it was to be examined by another tool of the King, called the Director of Justice. The resulting decision was as might have been expected: Nobody guilty and nobody punished, tho a sacred treaty stipulation guaranteeing to the natives their rights had been ruthlessly broken. The King, or some of his agents, has made representation to the United States Government, when complaint was officially made against such conduct toward the natives, that the official had been removed and punished.

Regarding this latter statement, I deny it *in toto*. The Governor himself last April at Boma informed me that the officer's term of service was completed and that he was going home to Belgium on a furlough. I came home with him on the same steamer. This is how much punishment he received for ruthlessly driving 5,000 natives as fugitives into the forests, where some of them died of starvation, for breaking up homes and thrusting men into the most cruel and abject slavery far away from their native region.

But why recount more examples of Congo State *justice*? It is clearly to be seen that the whole system of so-called courts is just a part of the settled *régime* to pillage, enslave and kill the natives and then blatantly point to these corrupt courts as a vindication for such conduct. How much longer will the Powers which organized the Congo Free State, and are responsible for the situation of affairs, permit themselves to be blinded by taking as the word of justice the decisions of these iniquitous courts? The United States had an important part in the founding of the Congo State, so our Government has a peculiar responsibility. Since the King and his accomplices in this great crime deny so strenuously these charges made by myself and others, I simply ask that an impartial commission be appointed to go there and investigate the situation, and I feel sure that a revelation of atrocities will be made which will stagger the civilized world.

LEXINGTON, VA.

Heritage

BY ERNEST NEAL LYON

WHAT joy of ours is garlanded to-day?
The liberty to labor,—and to play,—
The song and vision on the upward way!

The precious heritage of heroes past,—
Their purpose single, and achievement vast,—
They gave it gladly. May we guard it fast!

We sing of prowess and imperious will,
Of quiet Industry's unwearied skill,
And,—source of all,—Love's spirit, pure and
still!

NEWARK, N. J.

Literature

General Schuyler

PERHAPS no other General of the American Army during our Revolutionary War deserved better and fared worse in respect to popular favor than did Philip Schuyler. It was a clear case of wrong-headedness on the part of the multitude. Few men earned and received more of the personal confidence of Washington, Greene, Franklin and other great men, eminent in field or in council, and that they were justified in so trusting him events conclusively proved, tho in the meanwhile the man had suffered much from wounded honor and the country from the lack of the service he had been prevented from rendering.

The reasons for the feeling of those who distrusted General Schuyler, Mr. Tuckerman* shows to have been partly due to the envious machinations of General Gates and other men of more ambition than ability or patriotism, both in and out of the Continental Congress and the Army, and partly to a personal dislike among the New England troops. That Schuyler did not possess those qualities which render a man popular with the masses must be admitted, and besides this, he was too strict a disciplinarian to please a raw militia; but the roots of the dislike lay much further beneath the surface. There had been for centuries a commercial rivalry between England and Holland, and the sons of the two countries had brought their petty distrusts and rivalries with them when they came to the New England and the New Amsterdam, where, even in the face of common dangers and in defense of common interests, it was long before they became reconciled to each other. In their hearts the comfort loving Dutch, wealthy by contrast, despised the spare New Englanders, who lived so much more simply and hardily than themselves, while the New Englanders resented this contempt from those who—speaking chiefly their own language, as most of them still did—

seemed to them like foreigners and were to be distrusted accordingly.

Rare indeed are the men who have shown grander qualities in difficult situations than General Schuyler, and it is good to see them recognized as they are, and deserve to be, by so judicious a

GENERAL PHILIP SCHUYLER

writer as Mr. Tuckerman. The material for the biography, tho comparatively slender in relation to General Schuyler's private and political life, was richer as regards his military career, and all has been used with admirable skill and effect.

With the biographer the reader must deeply regret the loss of the entire and voluminous correspondence between General Schuyler and his beloved son-in-law, Alexander Hamilton, during the important years from the latter's marriage in 1779 to the deaths of Hamilton and Schuyler, which both occurred in 1804. In mercy to the possible descendants of the perpetrator of this atrocity Mr. Tuckerman has refrained from giv-

* LIFE OF GENERAL PHILIP SCHUYLER, 1733-1804. By Bayard Tuckerman. New York: Dodd, Mead & Co. \$1.60 net.

ing the name of the singular person who—upon the notion that this correspondence was too free in personal reflections—took upon himself the responsibility of destroying the whole of those able and interesting letters of an inestimable value to the history of our country and especially to that of the Federalist party.

We cannot close without calling attention to the admirable simplicity of Mr. Tuckerman's literary style.

The Unity of Plato's Thought

THE pleasure of commending heartily a classical study for any but dry-as-dust qualities comes to us so infrequently that we are prone to dwell on the occasion. Professor Shorey's monograph on *The Unity of Plato's Thought** is, as befits its place in this series of Decennial Publications, directed primarily to scholars, to specialists, in fact, but it bears a message of encouragement likewise to all who are interested in the humanistic value of classical studies, and who believe that a revival of human interest in Greek would do more for American culture than would any other discipline. Professor Shorey knows Plato as the old-fashioned divine knew his Bible, and he is, so far as we can recollect at the moment, the only classical scholar in this country to-day who, without falling into the quagmire of dilettantism, can write as if Greek literature were an embodiment of any genuine and profoundly important "criticism of life." If such a remark seems too harsh and sweeping, let the objector reflect on the enormous difficulty of pursuing a strenuous course of philological studies without losing the sense of literary values and the power of relating literature philosophically to life.

Professor Shorey's present monograph is an attack on the exaggerated use of the so-called *Sprachstatistik* as applied to Plato's works by Lutoslawski and others, who by counting up the number of times various particles are employed and by other statistical methods attempt to determine the chronological order of the Dialogs. Such a

system would appear to be innocent, and indeed in itself is perfectly harmless and possibly profitable. Only those who have some first hand acquaintance with the actual application of this method and others of a like nature can form a conception of the incredible absurdities into which it leads scholars who are apparently endowed in other respects with ordinary common sense. In the case of Plato in particular, it has led to a criticism of his philosophical development which no one to whom the Dialogs have any real meaning could for a moment accept and which Professor Shorey has here exposed with keen insight and minute scholarship.

"This method," he remarks with justice (and his words might be applied to many another method of the schools), "misleads scholars of great acumen and erudition to make false points, to labor fantastic analogies and to cite irrelevant parallels. It betrays them into misplaced emphasis, disregard of the context and positive mistranslation. In short, it necessitates the systematic violation of all the canons of simple, sane and natural interpretation of literature."

For an illustration of the true spirit in which Plato ought to be approached, we cite the following paragraph:

"Expositors of Plato seem strangely oblivious of the limits thus far set to all systems of philosophy. They treat as peculiar defects of Plato the inconsistencies which they detect in his ultimate metaphysics after they have elaborated it into a rigid system which he with sound instinct evaded by poetry and myth. They habitually write as if they themselves and their intelligent readers were in possession of a final philosophy which reconciles all conflicting claims of metaphysical analysis and common sense, and from the heights of which they may study merely as a historical phenomenon Plato's primitive fumbling with such problems as the nature of universals, the antimony of unity and plurality in thought and things, the relation of mind and body, the possibility of a consciousness of self or a knowledge of knowledge, the proof of immortality, the freedom of the will, the difficulty of conceiving or defining good, except in relation to evil, the alternative of accepting thoroughgoing relativism and phenomenalism or of positing a *noumenon* that cannot be described or brought into intelligible relation with phenomena. We are told that he has 'keine Ableitung des Sinnlichen,' as if there were somewhere extant a satisfactory deduction of the sensible world from some higher

* THE UNITY OF PLATO'S THOUGHT. By Paul Shorey. [Decennial Publications.] The University of Chicago Press. \$1.25.

metaphysical principle. It is objected that the relation of the ideas to the Deity is undefined, and that the personality of God is not investigated, as if any results could follow from an attempt to define the relation of the metaphysical *noumenon* to the Deity, or from an investigation of the personality of God. The absence of a complete table of categories is taken as a defect in Plato's system or as a proof of the immaturity of the *Phædrus*, as if the Aristotelian and Kantian categories were not mere illusions of the metaphysical instinct, and Plato was not far wiser in proposing only such categories and classifications as the argument in hand required."

Some Failures of Natural Selection

THERE are distinct and easily noticeable currents in present day biological thought that are setting away from Darwinism. They represent not only the inevitable reaction of the next generation against any scientific doctrine widely accepted by its predecessor, but they are also the index of positive advances in biology, whose significance fails of proper explanation on the older theory. What is shown up as inadequate in Darwinism is not the general scheme of evolution, the possibility of which is assumed, but the failure of the theory of natural selection to explain many observed facts, whose truth is too certain to admit of denial or minimization.

The volume* under review emphasizes especially the inability of those who would cling closely to Darwinian principles to explain the origin of life, since all biologic observation confirms the truth only of biogenesis,—life from preceding life, and not a bit of evidence can be found for spontaneous generation. The origin of life from another planet in the shape of star dust seeds or ova often suggested presents some practically insuperable difficulties from an astronomical standpoint, one of the principal of which is that in any catastrophe that would give the occasion for such a flinging off of organic particles more than sufficient heat would be developed to destroy all living things. It may be added, moreover, that even if life on our planet were to have come from such a source

this would only put the origin of life one step further back, but would leave its explanation still an unsolved problem. In this question, of course, it is the followers of Darwin, and especially Hæckel rather than Darwin himself, who are refuted, since Darwin speculated very little in this line.

It is with regard to the mysteries of reproduction, however, and the origin of instincts, that the principle of natural selection is found most lacking in its capacity to explain present day difficulties in biology. The most wonderfully interesting facts in the biological sciences are those which relate to the marvelous solicitude of parents for their as yet unborn young, or for such as are unable to care for themselves. In the insects in which the occurrence of transformation makes mother and offspring quite different creatures, usually of very different or even quite contrary tastes, this becomes one of the greatest marvels of nature. There are insects that bore a hole, put in a supply of food, deposit their eggs, and then go away never to return. The SpheX, an insect allied to the wasp, presents an extreme case of this, and, therefore, illustrates well the difficulty with regard to which Darwinism manifestly fails. At the end of a long passage this insect hollows out several chambers and deposits an egg in each. She then captures insects for food for the future larvæ, each different variety of spheX providing a different kind of food: crickets, spiders, beetles and caterpillars. Each insect victim is stung in a special way, so as to paralyze it. The victim lives for weeks and thus provides fresh food for the larvæ. Spiders are stung through the central ganglion; beetles through the main nerve between the first pair of legs. In order to accomplish this the beetle must be thrown on its back. Crickets, grasshoppers and caterpillars are disposed of by special sting methods for each kind of insects. The wonderful instincts that enable the spheX to accomplish its purpose of providing food for young it will never see, are entirely beyond explanation by any process of natural selection. The conclusion, according to the Semi-Darwinian author of the volume, must be that there has been "in the living

* DOUBTS ABOUT DARWINISM. By a Semi-Darwinian. New York: Longmans, Green & Co.

world the intervention of a Being possessing the attributes of intelligence, intention and power."

Wood Carving Design and Workmanship.
By George Jack. D. Appleton & Co., \$1.40 net.

The third volume in the artistic crafts series of technical handbooks has to do with wood-carving. Like the books that have preceded it in the series, the present volume aims at being practical, and the artist and the artisan carver will both find it exceedingly helpful. The aims and conditions of work from the standpoint of the student and apprentice are first set forth. The tools used and

something about them naturally follow. It is interesting to note that carvers use from half a dozen tools on simple work up to twenty or thirty for the more intricate carvings, this number being a selection out of a large stock numbering possibly a hundred or more. The book considers also the various woods used for carving, after which the subject of design in detail is considered. The technique of wood carving, its styles, the sources of inspiration, the classical carvings and much else all find places in the book that are well worth studying. Sixteen excellent collotype plates are used as illustrations in the book. The increase of wood carving as applied to furniture, interior decoration, in various architectural ways, in churches, theaters and other public and semi-public buildings, and even in railway coaches, makes a convenient handbook, such as is the present book, most acceptable to a growing class in the community.

Ponkapog Papers. By Thomas Bailey Aldrich.
Boston: Houghton, Mifflin & Co., \$1.00 net.

A more delightfully written series of comments and anecdotes does not often appear than this little book, which Mr. Aldrich names quaintly from his home in the village "nestled under the wing of the Blue Hills" (not without a thought for the neat alliteration, he admits), and which is apparently gleaned from his diary (if he keeps such) and note books. The volume contains also several chapters of a more conventional sort, such as the sketch of Tom Folio and the more elaborate essay on Robert Herrick; but the anecdotes are the heart of the matter. What could be better than this?

"Mr. Brookfield's father was, on one occasion, dining at the Oxford and Cambridge Club with George Venables, Frank Lushington, Alfred Tennyson and others. 'After dinner,' relates the randon recollector, 'the poet insisted upon putting his feet on the table, tilting back his chair *more Americano*. There were strangers in the room, and he was expostulated with for his uncouthness, but in vain. 'Do put down your feet!' pleaded his host. 'Why should I?' retorted Tennyson. 'I'm very comfortable as I am.' 'Every one's staring at you,' said another. 'Let 'em stare,' replied the poet placidly. 'Alfred,' said my father, 'people will think you're Longfellow.' Down went the feet. That *more Americano* of Brookfield the

younger is delicious with its fine insular flavor, but the holding up of Longfellow—the soul of gentleness, the prince of courtesy—as a bugaboo of bad manners is simply inimitable. It will take England years to detect the full unconscious humor of it.”

Indians of the Painted Desert Region. By George Wharton James. Boston: Little, Brown & Co., \$2.00 net.

Mr. James tells us that he has been familiar with the Great American Desert, with all its magic phenomena of nature

you will see such a landscape of color as exists nowhere else in the world. It suggests the thought of God's original palette—where he experimented in color ere he decided how to paint the sunset, tint the sun-kissed hills at dawn, give red to the rose, green to the leaves, yellow to the sunflowers and the varied colors of baby-blue eyes, violets, portulacas, poppies and cacti; where he concluded to distribute color throughout his world instead of making it all sombre in grays and black.”

In this iridescent land live the Indian tribes whose habits and traditions form

In the Heart of the Painted Desert

(From "The Indians of the Painted Desert Region")

and its strange inhabitants, for twenty years, and the fulness of his descriptions in these chapters would prove his knowledge of the country without any such assurance from the author. The Painted Desert, the Spaniards first named the region, and a paragraph from Mr. James's Introduction will at once explain the meaning of this title and give an illustration of his somewhat overblown style:

"Stand with me on the summit of one of the towering mountains that guard the region and

the substance of a thoroughly readable book. The numerous illustrations are from photographs taken by the author or by his special artist, who accompanied him.

Judgment. By Alice Brown. New York: Harper & Bros., \$1.25.

This novel is worthy of note only because the author introduces the same problem which is the basis of James Lane Allen's recent story, whether a man is under obligations to confess his youthful

follies to the woman he is about to marry. But apparently she does not really grasp the principle involved, and treats the question rather disgustingly from the sentimental point of view. When a writer has proved by such stories as "King's End" and "Marguerite Warrener" that she is capable of excellent work, to trade upon her own literary reputation with a flimsy, melodramatic tale of this kind is particularly objectionable.

El Dorado. By Ridgely Torrence. New York: John Lane, \$1.50.

For the tragic poet there is one thing essential: that he should refrain from cluttering with material circumstance the moral conflict on which his drama must finally turn. For this reason the search for mere wealth or picturesqueness of setting or incident should be deprecated rather than encouraged, inasmuch as it increases the writer's difficulty in keeping the real issue prominent. With respect to the whirl of life, whose profound ethical significance he is engaged in eliciting, his two best associates are simplicity and severity. It is in this particular that Mr. Torrence's tragedy of *El Dorado* leaves much to be desired, when judged by the light of that Æschylus whom he invokes in his Prologue. His motives are the usual ones of tragedy, to be sure; but these simple human emotions are lost in the complexity of their physical investiture. The action is laid in the sixteenth century and hinges on a search for the seven cities of Cibola, the scene being laid, first in Mexico, and "afterward dispersedly in the United States." To subdue such a luxuriance of material, the glare of a half-savage tropical city, the mystery of desert and wilderness, hunger, thirst and delirium, to the main end of tragedy, requires more power than is ordinarily found at the command of a beginner. And as might be supposed, Mr. Torrence makes his best effect with the more romantic elements of his play.

Flodden Field. By Alfred Austin. New York: Harper & Bros., \$1.20.

Mr. Austin's *Flodden Field* is a very creditable exercise in dramatic verse. It is rather pleasant than otherwise to read

these obsolescent forms of poetry; but the writer who undertakes them must be prepared to redeem their lack of vitality by some very striking merits of his own. Browning, we are told, has done so in "Pippa Passes," but then he had to sacrifice his dramatic integrity, and it is very questionable whether he has ever done so in any of his other dramas, as certainly Tennyson has not in his—so that Mr. Austin is at all events in good company. Still tragedy is the kind of thing by which we expect to see the poet make his *début*; every literary man should have written a tragedy at some time of his life—and suppressed it, tho if he does publish it, we are prepared to treat it indulgently in view of his youth and the frailty of man. But there is something a little incongruous in finding the craftsman persisting in the tasks of his apprenticeship.—Truly the way of the poet is hard nowadays, to say nothing of the way of the feudal poet.

Everyman: A Morality Play. Edited, with an Introduction, by Montrose J. Moses. New York: J. F. Taylor & Co., \$1.00.

In this edition of the famous old Morality play, brought into popular notice last year by its presentation on the stage, Mr. Moses has preserved the original spelling, and has sought by comparison of already existing editions to create as perfect a text as possible. The Introduction is a scholarly survey of the early history of the drama leading up to the Mysteries and Moralities. It is evident that Mr. Moses has not studied rhetoric as faithfully as he has dramaturgy, otherwise he would not indulge (more than once) in such English as this: "Finding this was detracting from the church's chief object, restrictions were vigorously imposed." It is a pity that a valuable book should be marred by slovenliness of this sort.

Hetty Wesley. By A. T. Quiller-Couch. New York: The Macmillan Co., \$1.50.

Out of the life of the Wesleys, Mr. Quiller-Couch has succeeded in making a book somewhat resembling a novel or romance. The narrative of this work is conducted with Mr. Couch's usual briskness and vigor. But

the construction is very much inferior to his best. It is not that his book suffers from a surfeit of fact, as is so often the case with this hybrid of history and fiction, but rather from an insufficiency of thread to make out the pattern; it is decidedly *décousu* and, like Dr. Johnson's net, full of "interstices between the intersections." And this is to say nothing of a set of inflections which are less literary than biographical; for it is notable *in re* the historical novel that the accentuations of life do not coincide with those of art. By entangling with his web several lines of circumstance that belong, not to his story, but to the universe at large, Mr. Couch has tried to indicate something of the large design of Providence in the Wesleys's fate and something of that ulterior and universal unity which lies outside of the province of literature in the inscrutable counsels of God. On this account the attempt, however impressive it may be made, is bound to be unsatisfactory in its very nature, because the harmony into which we must suppose the cosmos to resolve to the eye of omniscience is not identical with the partial harmony of art, which must contain its *rationale* within itself. For these reasons *Hetty Wesley* seems to us the most unsatisfactory novel of Mr. Couch's we have read. Nor is it much better as a biography. What saves it, and even makes it, for it is made in a sense before it ends, is not the character of the heroine, who seems half-stifled in the loose fray of the story; not the vividness of the scenes, which are, with a few exceptions, by no means so sharply etched as our author's usually are, and which diffuse toward the close into a sort of undulating mist—what saves it for the reader of any general information is after all just this impertinent but impressive sense of fatality whose implications he is prepared to supply from without. Something

sinister there is, as Mr. Couch makes it out, in the rule of that austere old family tyrant, the Rev. Samuel Wesley, Sr., who binds poverty, misery and ruin relentlessly upon the backs of his women in a blind conceit of the ends of Providence with his sons—but something sublime in it, too, as relieved for us against the background of history. Not in vain did they suffer on the edge of fire and flood and starvation, those women, patient or mutinous, mother and sisters of John and Charles Wesley, instruments of an invincible determination working to ends it never guessed.

Pioneer Spaniards in North America. By William Henry Johnson. Boston: Little, Brown & Co., \$1.20 net.

We are not quite sure whether Mr. Johnson designed his book for youthful readers or for adults. Certainly we mean

The Earliest Known Picture of a Buffalo
(From "Pioneer Spaniards in North America")

no derogation to his work when we say that it makes good reading for boys and girls in whom the romantic daring and inflated hopes of Ponce de Leon, Hernando de Soto and the other reckless adventurers are calculated to arouse particular interest. Mr. Johnson has not neglected the later authorities on the subject, and presents the Aztecs and other aborigines as they really lived and fought. The volume is abundantly illustrated, the pictures being taken for the most part from early documents and prints, and possessing thus genuine historic value.

The Samaritans. By J. A. Steuart. New York: Fleming H. Revell Co., \$1.50.

A cycloramic romance which begins with the slum life in East London and ends there in a sort of dramatic rotation of hideous pictures of degradation, crime and suffering. There is no well defined conclusion to the tale, but one feels that it ends because the author has exhausted his imagination and the reader's nerves. To say that he has written interestingly and effectively of the situation but faintly suggests the lurid horror of the book. He shows a genius for exploiting the ferocious and goblin side of deformed human nature, and the book is evidently veracious enough to prove useful to those interested in understanding the conditions of slum life.

Pa Gladden. By Elizabeth Chovey Waltz. New York: The Century Co., \$1.50.

Pa Gladden is an old Kentucky farmer who has "second sight," a heart full of "redeemin' love," and a mind that aspired after "God onspeakable." In him simplicity and courage are united with a turtle dove shrewdness, and we shall be better for making his acquaintance. Many of the stories are perfect in art and

sentiment, but occasionally the author makes the mistake most characteristic of those writers who attempt a romantic interpretation of spiritual living. She dwells too much upon the emotional features of goodness, and the effectiveness of her work is weakened by a too insistent sentimentality. Another fault is the incredibility of some incidents recorded. Thus when Pa Gladden, aided by a supernaturally intelligent horse, wins an idiot child back to reason and intelligence through "redeemin' love," the author is guilty of a perversion of sacred things no more permissible in fiction than it would be possible in real life. It is high time, indeed, that some romancers as well as so-called Christian Scientists recognized the biological limitations of life, and gave up falsifying facts that are a part of our physical scriptures. It is not only a moral blasphemy to represent "redeemin' love" in this way, but to many it is a repulsive use to make of an influence peculiar to the spiritual faculties. In the course of time science will rectify these crudities in literary art, and the sooner the better. Meanwhile Pa Gladden is a rosy old saint, who will win many hearts, in spite of his indiscrimi-

"Fer this Food"

(Illustration from "Pa Gladden")

nate spirituality. And while the author's dialect is at times, like her sentimentality, exaggerated, it is, on the whole, quaint and refreshing.

The Vagabond. By Frederick Palmer. New York: Charles Scribner's Sons, \$1.50.

This is Mr. Palmer's first novel, and it is something better than merely promising. The author has the gift of making out delightful meanings with his words. He freshens familiar ideas with youthful wit and a vigorous imagination. Apparently he is still young enough himself to write out all the bold hopes and beautiful absurdities of the boyhood mind. Certainly the brave young "vagabond" in the story, whose ambition was to run away, climb a mountain, own a mine, and find a girl, embodies the valorous ambitions of nearly every little boy in the world. And while this hero becomes a fine gentleman before the end of the story, every reader will care more for the little fellow with the short nose, stout chin and freckled face who ran away one night from his horror haunted home to find his mountain.

The Blood Lilies. By W. A. Fraser. New York: Charles Scribner's Sons, \$1.50.

A land of romance is the great Canadian Northwest, with its vast forest stretches, its evil sulphuric Muskeg (the deadly, bottomless "Devil's Lake" of the Indians); its mysterious trails, through spruce and prairie, and its hardy race of Scotch and French-Canuck frontiersmen, half-breeds and full-blooded redskins. Against this picturesque background stand out in bold relief and vigorous life-likeness Sandy Cameron, "huge of structure and great in gentleness," father of Malcolm, who wins for wife Franchette Gourelot, after a contest of wits and endurance wherein the Church of England prevails over that of Rome; Wolf Runner, the Cree; Mi-yah-tis, his woman, and last (since the first shall be last), little Mas-ki-sis, their son, upon whose naming bloomed "the red moon of disaster and the blood-lilies of bravery—the courage-flowers." The art that can so graphically draw such a poetic, dramatic and pathetic picture as this of the wild life of these rude Northland folk is viable

and enduring, and Mr. Fraser may fairly claim "by right of trove" and that of supremacy for the purposes of romance his lien upon the region he describes.

Jewel. By Clara Louise Burnham. Boston: Houghton, Mifflin & Co., \$1.50.

Another Christian Science tract concealed, like a sugar coated allopathic pill, in the alluring form of a novel. But Miss Burnham is to be congratulated upon the fact that she has discovered a harmless and legitimate use of Christian Science. Its absurdities are spiritual and romantic, and especially suited to forms of fiction. "Jewel," the ingenious little proselytizing apostle of the belief, is a child worth knowing, not on account of the doctrines she teaches, of course, but because of the curious situations evolved by them in her relations to the world which trusts the curing of all its pains and aches to the remedies of *Materia Medica*. The literary effect is marred somewhat by the evident earnestness of the author in presenting the Christian Scientist's point of view; but, on the whole, it is an entertaining story, brightened by much wit and a real knowledge of heart-diseased human nature.

Literary Notes

A NEW section of "The Oxford English Dictionary," containing words from *Lock* to *Lynn*, runs to 16 more pages than usual and completes the letter L.

....Two new volumes of the Dent-Macmillan Thackeray contain "Contributions to Punch" and "Denis Duval, etc." (Price, \$1.00 each.)

....The third volume of the Dent-Dutton edition of Lamb contains the Critical Essays. The frontispiece is an excellent photogravure of Fanny Kelly, to whom Lamb made a formal proposal of marriage. (Price, \$1.50 net.)

....The third volume of the "First Folio Edition" of Shakespeare contains "The Comedie of Errors," and is marked by the same excellent features as the two preceding volumes. In many respects this may be regarded as the most desirable of the easily obtainable editions of the Plays. (Price, 50 cents.)

....Putnams issue a second edition of Joseph McCabe's "Twelve Years in a Monastery." This work, which made no little sensation at its appearance six years ago, has been changed very slightly in the present revision. "I have

therefore," says the author, "taken the opportunity to revise the whole work, and now offer it as my mature judgment on, and as a completely unemotional and true depiction of, the system it describes."

.... "The Essays of Leigh Hunt," edited by Arthur Symons for the Dent-Dutton series, makes an unusually attractive volume. To quote from the Preface: "Here, the illustrator [Mr. H. M. Brock] will be seen collaborating with Leigh Hunt in his endeavor to bring vividly before us those aspects of streets, and shops, and theaters, and manners, which change from generation to generation, gaining, from generation to generation, something of the additional interest of things which already belong to the past." (Price, \$1.25.)

.... The elaborately planned series of Unit Books begins with the issue of "Letters and Addresses of Abraham Lincoln" and "The Marble Faun." The price of these books is determined in a manner quite unique. One cent is charged for every 25 pages of printed matter. Each volume is then published in three separate forms: in a paper wrapper, for which no additional charge is asked; in cloth binding, which costs 30 cents additional, and in full leather, which costs 50 cents. The partial list of works to be included in the series shows a wide and interesting selection. (Howard Wilford Bell, publisher, New York.)

.... For some time the Chicago *Tribune* has printed conspicuously every day a set of verses under the caption: "Poems You Ought to Know." Mrs. Peattie, the literary editor of that journal, has now gathered these poems into a volume of the same name. The peculiar attractiveness of her selection consists in the number of poems which are well known in a way, but are not readily found when wanted. Such, for example is Francis A. Durwage's "All," of which Bayard Taylor once wrote: "I know of no finer poem of its length."

"There hangs a saber, and there a rein,
With a rusty buckle and green curb chain;
A pair of spurs on the old gray wall,
And a mouldy saddle—well, that is all.

"Come out to the stable—it is not far;
The moss grown door is hanging ajar.
Look within! There's an empty stall,
Where once stood a charger, and that is all.

"The good black horse came riderless home,
Flecked with blood drops as well as foam;
See yonder hillock where dead leaves fall;
The good black horse pined to death—that's all.

"All? O, God! it is all I can speak.
Question me not—I am old and weak;
His saber and his saddle hang on the wall,
And his horse pined to death—I have told you all."

Pebbles

EVEN if Dowie is Elijah, need Zion be so propheta-ble?—*Yale Record*.

.... "Iodide of Potassium." "How long was she sick?"—*Cornell Widow*.

.... A thin woman who claims to be delicate is bad enough, but a delicate fat woman is the limit.—*Atchison Globe*.

.... "Mark Twain has 'A Dog's Tale' in the December *Harper's*. It is quite waggish."—*Boston Herald*. Pity it is so curtailed.—*Cleveland Plain Dealer*.

RUBBER.

He: "Won't you let me give you just one kiss before I go?" She: "Will just one satisfy you?" He: "Yes, darling." She: "Then I won't give it to you."—*The Standard*.

.... Johnny: "I was just now talking to that famous boy who went into the garden to eat worms." Billy: "What of it?" Johnny: "Well, he spoke with bated breath, that's all."—*The Princeton Tiger*.

Man wants but little here below
When eating a la carte,
But when it's table d'hôte, he wants
It all, right from the start.

—*Yale Record*.

.... Upon a certain occasion General Sherman was the guest of honor at a banquet, after which a reception was held. Among the line of people who filed in and out to shake hands with the great war hero, General Sherman perceived a face that was very familiar, but which he could not place. "Who are you?" he asked in an apologetic aside, as he welcomed the guest heartily. The man blushed and murmured behind a deprecatory hand—"Made your shirts, sir." "Ah, of course," exclaimed the General loudly, turning to the Receiving Committee behind him. "Gentlemen, allow me to present Major Schurtz."—*Army and Navy Journal*.

.... President Schurman has lately published the following schedule for students of the university: Sleep, 8 hours; study, 11 hours; eating, 2 hours; physical exercise, 2 hours; recreation, 1 hour. In the main *The Widow* heartily approves of this arrangement. But why, in the name of all that is scholarly, does the President want to waste all that valuable time in the vulgar and carnal pastime of eating? Surely ten minutes, three times a day, is sufficient for the hermit's fare of parched peas and water, and thus ninety golden moments might be added to the time allotted to the great search after truth. If we are going to be ascetic, let's do the thing right in spite of President Schurman's insular ideas regarding the amount of food necessary to support human life.—*Cornell Widow*.

Editorials

The Reaction

WE expressed the opinion, nearly two months ago, that a period of industrial conservatism was probably at hand, to be marked by reduction of output and prices, and a checking of investment in commercial additions and improvements. Much evidence of this conservatism is now to be seen, especially in the iron industry. Output has been largely reduced, but still appears to exceed consumption; prices have fallen, and buyers are waiting for a greater decline; railroads are striving to stimulate export sales, and to gain traffic, by cutting freight rates. There has been no general reduction of the workingman's wages, but they are beginning to seek a lower level. The cotton mill hands in the North have lost 10 per cent., owing partly to the increased cost of cotton. There are signs of retrenchment and caution in many industries. When prices begin to fall, consumption is checked, because buyers, especially in the wholesale trade, wait for the lower figures that are expected. Thus the demand for goods at the mills is greatly reduced. Such dullness does not necessarily point to approaching and long continued depression. We shall not attempt to predict how severe this reaction will be, but we expect that it will be temporary, because fundamental conditions are sound. The year's crops have been abundant, the national currency is on a firm basis, the Treasury's coffers are full and the volume of foreign trade continues to be large. Prices have been too high; in many industries wages have been raised to accord with them. If both wages and prices decline, this will not reduce the country to a condition of panic depression.

There have been several causes of what has taken place. Large crops, great exports and the firm establishment of the gold standard brought about a condition of great prosperity. A successful war, ending with the acquisition of territory, stimulated the activ-

ity and buoyancy which prosperity produced. Upon this foundation was reared an amazing structure of speculative inflation, shown chiefly in the combination of industrial plants, the extraordinary overcapitalization of them, and the manufacture of shares of stock to be unloaded upon an optimistic public. To excesses of this kind there must be an end. At last a time comes when a gorged public ceases to buy, when speculators can no longer unload, when banks restrict their loans, when the price of inflated stocks begins to fall in a market clogged with many that cannot be digested. The summit had been reached and passed when, in May last, Mr. Cassatt unwisely cut down and threw over his railroad fence a million dollars' worth of Western Union telegraph poles and wire.

From the date of that great blunder, the decline has been continuous. When the climax of a period of wild speculative inflation is at hand there are always some powerful capitalists who know how vulnerable the situation is and are willing both to hasten and to take advantage of the inevitable reaction. They may have grudges to satisfy, or there may be great properties which they desire to acquire. The decline which we have seen in 1903 was accelerated by powerful "bears," who could sell, and continue to sell, great quantities of shares for the fall. For a long time they never permitted the strangling stock market to come to the surface for breath. The outside world does not yet know whether their purposes have been fully accomplished. It does know that the decline, or the greater part of it, was justified by internal speculative conditions, for the rottenness of these has been revealed.

The effect of such a downward movement, so prolonged, cannot be confined to "Wall Street" or New York. It spreads throughout the country. This is a lesson that many are slow to learn. The effect is widely felt because the New York Stock Ex-

change is like a ganglion in which nerves from all parts of the land terminate. There is no city or town in which loss has not been caused by this long fall of market values. Thousands of small capitalists engaged in trade or manufactures have been embarrassed or restrained in their undertakings by losses in speculation or investment. The calling of loans, the rejection of collateral, the diminution of income, have checked expenditure and restrained industry. Other capitalists, not directly affected, have become extremely cautious. Few realize how widely extended the trading in shares on the exchanges has become in the last few years. This is not a business, or an amusement, that is advertised and proclaimed from the housetops by many who indulge in it. Retrenchment, caution, sudden conservatism in one frequently suggest the same course to another. While values are steadily falling as if there could be no end of the decline, commercial timidity increases. The effect of all this upon business is restraint that cuts down the volume of trade.

If capitalists by their excesses in the manufacture of inflated and indigestible securities invited this reaction in which the innocent investor suffers, organized labor in the building trades vied with the great "bears" in accelerating the decline by attacking that industry to which both the speculator and the investor looked for sure signs of impending change. Blackmailing walking delegates and their deluded followers in the great cities could not have more effectively served the interests of those who desired to depress the share market than by stopping work on \$100,000,000 worth of steel frame buildings, preventing the investment of \$50,000,000 more in such structures, and thus cutting down the output and earnings of the steel companies whose securities dominated the market of the Stock Exchange. In their blindness the rank and file of these unions helped to destroy their own prosperity.

If there must be severe losses on account of this reaction, there will also be gains in the shape of enlightenment for some as to the real character of a

large part of the Trust movement. This storm will clear away the fog of canting pretense by which promoters and many makers of industrial combinations have sought to justify and commend their schemes to the public. Everybody can now see how the waterlogged Trusts are weighed down by their enormous overcapitalization, and can understand how much philanthropy and patriotism there was in the generous appraisal of subsidiary concerns and the "distribution" of shares by expert manipulation in the Exchange and "curb" markets. All who know how small independent companies are now profitably underselling the Trusts can see how much the boasted "economies of combination" amount to. And some who bought shares at high prices from the industrial philanthropists will understand in whose pockets their money has lodged. We do not wish to be understood as indulging in such criticism without discrimination; but the wrecks uncovered by the decline and the light thrown upon Trust promotion by recent official investigation show that as a rule the motive has been greed, and that a majority of the promoters, as Croker said of himself, were "working for their own pockets all the time."

Facing the Ultimate Issue

No better news of moral progress could be told in many a day than would be the announcement, made but denied, that the Standard Oil Company refuses to answer the questions propounded to all trust corporations by the new National Department of Commerce and Labor. The questions relate to capitalization and other financial items. The issue raised is that of the right and power of the Government to enforce publicity in the affairs of industrial corporations. It is to be desired that such action of the Standard Oil Company might not be a piece of pettishness or mere obstructionism, but taken deliberately for the purpose of obtaining from the Supreme Court a final ruling on this great question.

Such a step is on every account to be welcomed. The sooner the American

public knows where it stands in regard to this matter the better. If the corporations that have been created by the state have become superior to the state, or, to speak in language technically correct, if they have wrested sovereignty from the people, and have themselves become the state, let us by all means have an authoritative declaration of the fact.

The maxim that eternal vigilance is the price of liberty is easily forgotten in a republic where prosperity diverts to material interests the thoughts of men upon whom the Commonwealth must rely for the vigilance. Yet from time to time public feeling is aroused over some especially brazen challenge of popular sovereignty. When the slave-holding oligarchy attempted to subvert a government of the people and by the people, there were no delusions in the minds of unsophisticated men as to the true character of the issue raised. It was the fundamental question, Who is sovereign? Where in the United States does sovereignty reside? Again, when the Mormon power, waxing strong and insolent, could no longer content itself with flaunting its program of barbarism in the face of civilization, but must preach through all its elders and missionaries the doctrine of the supremacy of the Church, and the superior authority of the commands of the Church over the commands of the nation, the American people once more saw clearly that the issue presented was again that of popular sovereignty. Had we raised up on the sands of the Great Basin an empire within the empire that had become superior to its creator, and was ready to assert its independence of the power from which it sprang? The issue was squarely met by unmistakable measures, and the Mormon Church was taught its place as a subject of the one rightful sovereignty within the territorial limits of the United States, the undivided American people.

There are thousands of sincere and intelligent minds that have been slow to see that a third time popular sovereignty is being openly challenged and contemned. With unbounded generosity the American people, through their State governments, have created a flexible form of corporate organization, and have bestowed upon the men that have taken ad-

vantage of it fabulous gifts of franchise, patent right and other forms of monopoly. These gifts have yielded wealth beyond the dreams of avarice to a comparatively small class of resourceful and not excessively unscrupulous business men. Beneficiaries and givers of this bounty, alike, have unthinkingly assumed that all the maxims of personal liberty should of right and expediency apply to these monstrosities of law, these artificial personalities called corporations. They have assumed that because it is contrary to the principles of civil liberty for a government to ask of the individual an account of his private business, it is equally inadmissible to pry into the affairs of the corporate personality. This view has no justification in logic, in morals, or in common sense. Individuals create the state as a means to an end. That end is individual security and happiness. The corporation is created by the state, and must either remain subject to the state, or, grasping at power, it must assert sovereignty and proclaim itself the state. The issue is just as clear as the issue was between slave-holding oligarchy and the nation, or between the Mormon Church and the sovereign people.

Let us state the case with uncompromising clearness. If liberty is a moral right, and socially expedient, and if political constitutions ought to express moral rights and social expediencies, the Government cannot tell the individual how he shall conduct his private affairs, or compel him to disclose his balance sheet to the inspection of his fellow-men. But by the same token the Government may demand anything whatsoever of the artificial personality, the corporation, which the sovereign people will to do or to know concerning corporate affairs. The Government may lay any law or restriction upon methods of doing corporate business, and command any desired degree of publicity. To deny this conclusion is to deny popular sovereignty, and to contest it is an act of rebellion.

And so, let us repeat, we should be glad to see the issue raised and brought before the Supreme Court of the United States. The decision which the court would hand down would authoritatively tell us whether the American people are still sovereign within the States and Ter-

ritories of the United States, or whether sovereignty has passed over to the oligarchy of the trusts.

Recent Discoveries in Eastern Lands

THE spade keeps digging, and the earth keeps bringing to light new treasures of ancient times. They are classical, biblical and historical. We have previously taken pains to report such discoveries as an ode of Timotheus, the Laws of Hammurabi, and the so-called Sayings of our Lord. We gather a few others of considerable interest.

Remnants of a drama of Sophocles, hitherto entirely unknown, named "*Achaiôn Syllogoi*," have been found in a papyrus collection brought to the British Museum. Arrangements for its early publication have been made. The extracts are not large, but enough to show the character of the book. Considerably more extensive are the portions found of the "*Protrepdikon*" of Aristotle, which also had hitherto been known only by its title, these remains having been discovered in the papyri storehouses unearthed by Grenfell and Hunt in Oxyrhynchos in Lower Egypt. Ninety lines have been found of two odes, one a "Partheneion," by Pindar, and the other the argument of a drama named "Dionysalexandros," by Cratinus, on the subject of Paris of the Trojan War. A very important Latin manuscript from the same collection is an epitome of Livy, Books 37-40 and 48-55. Such Latin papyri are very rare, and this covers eight books that were lost. The period covered is from 150 to 137 B. C. There has also been found a part of the "Medea" of Neophron, which is of historical importance because it was originally written for the contest that won the prize for the drama of the same title by Euripides.

A whole collection of Egyptian peasants' letters, written in Greek and ascribed to the third century, were recently brought from Egypt to Florence. They are of special importance for the study of the agricultural conditions in the Nile Valley, and supplement in a most satisfactory manner the letters discovered some months ago and published in England, being the work of the Roman

planter Lucius Bellenus Gemellus, about 100 A. D. These are of value in explaining the Alexandrian Greek of the New Testament. Thus in the last finds the word *kamelikos*, meaning *carried by a camel*, explains the meaning of *onikos*, *drawn by an ass*, in Mark 12:42.

Another third century fragment was from a non-canonical gospel parallel in form to the Synoptists. In it was a part of a discourse similar to the Sermon on the Mount, and a conversation between Christ and his disciples, answering the question, "When will Christ's Kingdom be realized?" An interesting fragment of Irenæus was found.

Professor Petrie also announces the discovery of another collection of the "Sayings of Jesus," similar in style to the "Logia" found six years ago in Egypt. These and other theological and classical fragments will be published next June. These newly found "Sayings" are not well preserved, and do not seem to be as important as those which so excited the interest of the religious world in 1897. But this is of much interest, that they are stated to be "sayings" which our Lord uttered to Thomas. In them are included one which was previously known because found in the Gospel according to the Hebrews: "Let not him that seeketh cease from his search until he find, and when he finds he shall wonder; wondering, he shall reach the Kingdom [of Heaven], and when he reaches the Kingdom he shall have rest." Another important one is on the subject, "The kingdom of God is within you," but it is reserved for the full publication. This new discovery proves that this and the "Sayings" of 1897 are no part of the Gospel according to the Hebrews, nor of the Gospel of St. Thomas, nor of any other uncanonical Gospel, but simply a collection of Sayings popularly attributed to St. Thomas, which had its origin somewhere from 100 to 140 A. D. They illustrate the superior character of the canonical Gospels.

Père Scheil, so well known from his connection with the Hammurabi finds, reports a most interesting discovery made in a Babylonian city, the details of which are published by the French Archæological Institute of Cairo. This find is nothing less than a complete school, with all its

equipments, furnishing full information on the pedagogical work of the times of Hammurabi, twenty-one centuries before the Christian era. The little city of Sippara, where the find was made, called, in distinction from less important towns of that name, Sippara of the Plains or of the Sun, measured only 1,800 by 800 meters, but was surrounded by good sized schools. Not least among a lot of interesting discoveries there is a regular school house, with the working materials of both masters and pupils. Here may be found a lot of statuettes and tablets. On one of these are found the words: "He who distinguishes himself in the school of writings will shine like the sun." The structure had seven rooms, in one of which were found arranged in regular order a very large number of small tablets. Quite a goodly number were yet intact and their contents very instructive, containing hymns in Sumerian, the oldest language of Babylon; meteorological lists, primers, word lists, arithmetical problems, contracts, etc. Some of these had evidently been copies given to the pupils as models, easily recognizable by the firmness and clearness of the writing. The other tablets were the work of the pupils, consisting of special phrases, lists of signs and words, and only rarely of complete texts. On many of these the tentative efforts of the pupils had been corrected and changed by the master's eraser. All of the texts that bore any date at all were marked with the name of King Hammurabi. Père Scheil was able to reconstruct pretty fairly the program that was adhered to in teaching the Babylonian youths of nearly four thousand years ago how to read and to write.

Taking Time into Partnership

It was Napoleon, we believe, who said, "I and Time can do all things." Had he been willing to take time to make himself and his country great by the arts of peace instead of hastening it by violence, he might not have made France the most humiliated of nations, nor died imprisoned by ocean's waves and guarded by England's soldiers. France had to be well done with two Napoleons before she could learn that greatness lost could be

best recovered by the slow processes of peace, industry and education, and that "*Vive l'Armée!*" is, as the French now say, closely allied to "*Vive l'arme!*" war and tears.

If there is work to do, take Labor into the firm as a working member, and Time as a sleeping partner. Neither is good for much alone, but together they can accomplish anything.

There are in the State of Texas 246 counties. By the slow process of popular agitation and instruction, all but some forty of these counties have voted themselves "dry." The saloon is forbidden to exist, and popular sentiment and juries support and execute the law. Every year a steady and healthy advance has been made under local option. But now the enemies of the saloon are impatient. They propose to enact a State law to shut up the saloon in those counties and cities that are not educated up to it. They have the votes, and can enact the law. But can they execute it? Will they not lose all with the partner Time, and with him lost go into bankruptcy? We very much fear it; the Devil and Galveston will beat them, and they will learn too late the lesson of patience in well doing.

The long suffering cause of women's suffrage has lost in times past from the failure to take counsel of Time. Its ardent advocates imagined that they could obtain their purpose by a Constitutional amendment, instead of by the slower process of educating the people gradually through the stages of partial and complete suffrage, and State by State. Already there is progress enough achieved to gratify, if not satisfy, those who believe in the blade and the ear before the full corn fills the perfected ear.

No cause has suffered more from the proposal of speedy nostrums than that of the elevation of the enfranchised negroes. We have found that righteous Amendments and laws to protect civil rights will not execute themselves. In a dozen States the Fifteenth Amendment is practically annulled, as Secretary Root has told us, and all the country knows. Every little while we hear the proposition to correct the evil by reducing the Congressional representation in the States which limit the suffrage practically to white people only. Just as such a law

might be, we do not believe that it could be administered so as to gain its purpose; and if it could, it would not solve the problem. Only one solution is of any value, and that is found in taking Time as partner in the slow labor of education and culture.

But that will be a long task. It will take years, perhaps generations, to accomplish the various reforms which we wish to hasten.

True; then take time. Let another and another generation, if need be, take up the tasks of Temperance and Equal Suffrage and Racial Rights. If in the interval before these objects are gained many suffer or die, so be it; it is the best way. Life is not a sacred thing. How freely did we spend it to secure the unity of this Republic. Nature does not know life as sacred. She kills men every day in a thousand lingering and torturing ways. And trade and commerce and manufactures do not hold life sacred. And the flux of a changing civilization cannot hold life sacred. Men will and must be crushed in the collisions of social movement as well as in those of railroad commerce. Let them die. We can't always help it. They are martyrs that must be offered up. It is very sad, but meanwhile we will not sit still, we will work the harder and be patient. Time and labor are sure to gain the victory at last.

Responsibility for Disease

WITHIN the last few days has come the news of an outbreak of typhoid fever in two university towns in this country. Taken in connection with the serious epidemic of this disease in another university town at the beginning of the present year, these announcements give rise to the thought of the supreme necessity in which municipalities and university authorities are bound to care for these young lives intrusted to them. A thousand are reported sick with typhoid in Butler, Pa.

Typhoid fever is no longer to be considered as an inscrutable dispensation of Divine Providence, nor are deaths from it to be accepted as visitations from on high. We know the cause of the disease; we know the manner of

the distribution of the bacillus of typhoid fever, and we know that with proper care there need not necessarily be any further spread of the disease. When new cases occur some one has blundered. In the present state of our knowledge, however, this blunder is surely criminal. We know that the bacillus of typhoid fever is contained only in the excretions of typhoid patients. It never gets into the air; it never originates anew in any special combination of filth or unsanitary conditions. The only way in which the disease can be contracted is for some of the excretions of a typhoid fever patient to find their way into the food or drink of other individuals, who have not recently suffered from the disease and are consequently susceptible to it.

Under these circumstances it must be a matter for unfailing surprise that typhoid fever should continue to be so common. With a proper realization of these manifest pathological principles, it is not difficult to understand and even sympathize with the expression of the enthusiastic sanitarian, whose zeal for his favorite science might seem to the layman in sanitary matters to have carried him beyond the bounds of discretion, when he said: "Whenever a person dies from typhoid fever, some one ought to be hanged." Far from being an exaggeration, this is or should be the feeling of every one who appreciates our present knowledge of the disease. There is no longer any reasonable excuse for the continuance of typhoid fever as the great epidemic disease of cities. When it occurs the responsibility for it should be sought out as carefully as is the responsibility for crime. It is unpardonable in our day that the purveyors of food and of water should not be made to realize their responsibilities in this matter.

Why, then, are certain American cities so afflicted by typhoid fever? Entirely because the municipal authorities, tho assuming the obligation to furnish pure water and inspect food, fail to fulfil their duties. There are cities in the United States that continue to be visited by the disease as an annual scourge, and they are rigidly held up to the contempt of the world as not sufficiently interested in their

own welfare to secure proper municipal conditions for civic health. In Europe the example afforded by such municipalities goes far in the minds of many to proclaim the failure of democratic government. At least three of the old great cities of Europe, amid sanitary conditions much more unfavorable than obtain in any of our newer cities, succeeded in wiping out almost entirely the plague of typhoid fever that had been a source of serious fatality for centuries. The same thing can be accomplished here if the same attention be paid to the terms of the problem, and if a like sense of civic duty will animate citizens in securing their common wealth in this important matter.

There is an important legal side to this question. Cities undertake the duty of supplying water to their inhabitants, or the municipal authorities grant a franchise for this purpose to some private corporation. In either case it seems very clear that if water is provided containing the germs of disease when by the exercise of due care and vigilance this danger could be avoided, an action in damages should lie against the city itself, or the holders of the franchise. The municipality or corporation through whose neglect of such safeguards as are well recognized to be necessary for the protection of drinking water from contamination by disease germs, citizens are subjected to the danger of loss of life, or of precious time with the worry and emotional strain incident to long illness, cannot shirk its civil responsibility any longer. A great change has, in recent years, come over the state of public feeling, with regard to the assessment of damages for bodily and mental suffering inflicted by the negligence of corporations and their employees. The principles of law that have been developed as a consequence of this feeling must hold with regard to the spread of disease, with its consequent suffering, through any of the great public utilities, as the water or milk supply of large cities.

This view of the situation, if properly enforced by judicial decisions, would doubtless do more to prevent the recurrence of epidemics of typhoid fever

than any amount of protest on the part of citizens or reclamations by boards of health, or by medical societies. The community must be educated to realize the thoroughly practical character of this attitude toward the conveyance of such infective diseases as typhoid fever. There is, of course, in addition to the civil responsibility in some cases an actual criminal responsibility quite as direct as is the case in railroad accidents brought about through knowing negligence. When city officials or directors of water companies know that typhoid bacilli are present in the water furnished to citizens, they must know, too, that its use will inevitably be followed by illness and death. The pretense of ignorance will not justify them in a do nothing attitude in this matter since experts are at hand in abundance capable of deciding without much delay the presence or absence of typhoid germs. Damage suits may thus prove the solution of one of the most important sanitary questions in modern city life.

Irrigation and the Public Domain

FEW matters have come before Congress in the past decade of greater interest to the home life of the nation than that of irrigation and the attendant one of the disposition of the public domain. The problem is far from settled, and it will be prominent in the discussions of the coming session. For years it has been well known that the public lands, intended as an inheritance for the common people, were being used by the rich corporations. The lands were of so little value that the monopoly was endured and cattle and lumbering companies enriched themselves at the expense of the nation. Settlers would not attempt agriculture on the unwatered areas and the Government had no way of disposing of the surplus real estate profitably.

The adoption of the new irrigation law a year ago changed all that. This important measure, brought forward and enthusiastically supported by the entire West, provides, in brief, that the receipts from a certain portion of public land sales each year shall be kept as a fund for the

extension of irrigation under Government control, for the purpose of watering and making fertile yet other areas until all possible portion of the plains shall be brought under the beneficent influence of the ditch moisture. In other words, the land seized by the corporations and cattle companies is to be improved at the expense of all the people. The lands are intended for the settlement of the homeless farmers of the nation. With the continuance of the present land-grabbing they will be absorbed by those who have no shadow of right to them, and will become the homes of tenants when irrigation has transformed the soil into fertility.

It is estimated that in the semi-arid portion of the West there are about 600,000,000 acres of vacant public lands with sufficient water to irrigate one-sixth of it, or 100,000,000 acres. In his address before the recent National Irrigation Convention, President W. A. Clark stated his belief that if the Government will spend \$10,000,000 annually for thirty years, thoroughly irrigating 20,000,000 acres, it would thus provide homes for 10,000,000 to 15,000,000 people. As this sum could easily be realized from the sale of the lands, there would be a splendid investment for the Government, provided it were possible to compel the fraudulent land-seeker to keep out. This is precisely what it is not possible to do under the present system of land laws, and it is for this reason that the problem is so insistent in Congress. The friends of legitimate settlement are anxious that every loop hole for the fraudulent entry on the public domain shall be stopped—as it should be.

President Roosevelt, in his message to the Irrigation Convention, emphasized the fact that "irrigation development in the West cannot stand alone." Forestry, as he pointed out, and the protection of the public domain, must go with it.

In the past two years the entries under the various Desert Land acts, Stone and Timber acts, and Commutation acts of the Homestead law, have increased by leaps and bounds. Their repeal, or sufficient modification, has been urged by the Land Commissioner, the Secretary of the Interior and the President, but thus far Congress has refused to act. The eager-

ness with which the open areas have been sought has resulted not alone from the expectation of the improvement through irrigation at Government expense—tho that has no doubt been a potent cause—but the westward crowding of the vast army of settlers has alarmed the cattlemen, and they are seeking to secure the free range before it is too late. Their methods are generally irregular and often unscrupulous. When half a county is fenced into one pasture and when barbed wire fences are run a quarter of the distance across a State, it is ample evidence that the real homeseekers are not getting their share of Uncle Sam's farm.

The number of desert land entries increased from 174,201 in 1897 to 929,230 in 1902. Under the Timber and Stone acts the entries, which five years ago covered 40,609 acres, last year accounted for the transference to private owners of 545,253 acres. A Government officer of the Land Department recently gave an opinion that two-thirds of the entries in a given district of a prairie State were fraudulent, being secured through the scheming of cattle companies, which thereby obtained large pastures at a trifling cost.

The working out of a system of land laws that would meet the present conditions better than those adopted years ago, when there was apparently land in abundance for all the needs of all the people, might bring hardship upon some of the settlers temporarily, but in the end it would give to the nation a better return than is now being secured from the operation of the statutes in force. If the reclamation of the arid and semi-arid lands by irrigation is to be accomplished at Government expense, there should be some adequate advantage to the people who are seeking homes in that vast territory. The settler is the real beneficiary of all these vast enterprises, and if the good is not to go to him it is a waste of money and effort to bring fertility where now is but the open plain and roaming herds and flocks. It would be unfair to ask this for the benefit of wealthy corporations and the improvement of cattle ranches.

Among the suggestions made by men who have studied the situation is one

that, in view of the better methods of agriculture in vogue, and the more intense system of cultivation now common, the amount of land to be secured by one person, either by homestead or purchase, be reduced from 160 acres to 80. Whatever plan is pursued, it is plain that the revision of the laws should be in the interest of the actual settler, who purposes the creation of a new home. He is the man above all others to be considered.

The Public School Question in England

PERHAPS the Rev. Robert F. Horton, D.D., is as representative a Nonconformist as there is in England, and his reply to the Archbishop of Canterbury's appeal for a compromise on the school question may be regarded as speaking the voice of those who oppose the present Education act, which has stirred up such opposition and is likely to wreck the Government. In this reply to the Archbishop Dr. Horton—and the Nonconformists indorse him—declares that he and his friends will consent to no agreement which does not accept these two principles:

"(1) That all schools maintained by public money must be absolutely under public control.

"(2) That in all schools maintained by public money all teachers must be appointed by the public authority, without reference to denominational distinctions."

If these two principles are admitted he will admit any provisions, equally administered, for all the religious or sectarian instruction that may be desired. He wants a real religious teaching. He says:

"I believe that I express the thought of the vast majority—nay, I am convinced, nine-tenths of our population—when I desire that all our children should be taught not only to 'speak the tongue which Shakespeare spoke,' but also to 'hold the faith and morals which Milton held,' that in every school there should be the sense of God, the habit of prayer and praise, and the reading of the Book, which is at once the supreme religious treasure of the world and the greatest masterpiece of English literature.

"If we might take a *plébiscite* of the people

I venture to think that the minority would be for the most part silent. If, therefore, the Bible and prayer and praise are excluded from our school its will be due not to infidelity, but to the intractable divisions of professing Christians. From that sad result I would strain every nerve and make every sacrifice to deliver the land I love."

This utterance, from one of the most liberal of the English Liberal Nonconformists, illustrates how far the British thought is behind that of this country on school matters. This is one matter to which we trust the English Educational Commission, now in this country, will give their minds. We are as religious a country as is England, and we exclude religion from schools supported by public money, and refer it to parents and churches. We find it safe. *The Outlook* has done a good work in getting answers from twenty Presidents of leading colleges and universities from Maine to California to the question whether they find that the students that come to them from the public schools are more "godless" or "anarchical" than those that come from denominational schools, as would be the case if, as asserted by a Catholic bishop and an Episcopal clergyman, such is the necessary influence of our non-religious public school system. The unanimous response is that no such influence is discoverable. President Schurman, of Cornell University, says that out of 456 freshmen who came from the public schools, 297, or 65 per cent., report themselves church members, while of the 118 who came from private or denominational schools only 66, or 56 per cent., are church members. The fact that about two-thirds who came from public schools are church members is proof enough that these schools are not "godless."

A court in a Western State has just decided that it is unconstitutional to require the Bible to be read as a religious exercise in its public schools. We make no objection to that, for it is right. We do not ask or trust the State to teach religion. Our English friends have not yet learned what separation of Church and State involves, nor do they know that religion can trust to its friends, and that nowhere is religion in so bad a case as where the State controls its teaching.

Advance on the Lambeth Platform

The Churchman publishes in full the sermon preached by Bishop Carmichael, of Montreal, before the late Pan-American Conference of Episcopal bishops, on "The Attitude of the Episcopal Church Toward the Protestant Communions Around Her." It gives a comparative analysis of the teachings of the Episcopal, Presbyterian and Methodist Churches on doctrine and order, and it finds a close agreement between them on the most essential points. The value of the sermon is in the conclusion reached, even more than in the resolution appended and adopted. It is that "some practical step should be taken in accordance with, but in advance of, the Lambeth platform" for union. The value of the proposition consists wholly in the nature of the "advance;" for the Lambeth platform has been sufficiently proved to be insufficient as a basis of union. Its fourth article, "The Historical Episcopate," maintains division, at least as interpreted. The resolution adopted does not seem to throw any light on the nature of the "advance." It suggests "the composition of some of the differences, and the recognition that others do not constitute a sufficient reason" for separation. If these Churches could only devote themselves to this "recognition" that their differences are unimportant and must be allowed, and not bother themselves about the "composition" of their differences, which is sure to make trouble, there would be more assurance of success in a most desirable direction.

Immigration to South Carolina

South Carolina is awakening to the importance of attracting immigrants. An organization has been established for the purpose of attracting Scotch, German, Scandinavian or other immigrants of a desirable sort. But they are very particular as to the sort. We do not hear that they want Irish, Italians or Hungarians. We wonder if there is to be a religious discrimination. We notice that they say about a million immigrants entered the country last year, and not one of them went to South Carolina. There must be some reason for it. We observe

that our Weather Bureau represents pelting storms as moving freely in any direction until they meet an obstructing wall of high pressure, which drives them from their natural course. What is the obstructing wall which diverts the current of immigration from South Carolina? The *Charleston News and Courier* suggests that it is the danger to human life. The man who kills an editor or anybody else there cannot be punished; all homicide is justifiable. That may well be one reason. Immigrants hesitate to go to a State in which any town of four or five thousand inhabitants can point with pride to two or three or half a dozen men who have killed their man and never suffer any punishment. But there are other reasons. A Macon, Ga., paper suggests it when it says, in order to get desirable immigration:

"We must get rid of and cease to circulate the foolish notion—a product of the imagination of the interested slave trader of sixty years ago—that only negroes are adapted to the labors of the field in this section."

That is, immigrants do not like to go to a region where labor is not honorable. If they go, they will go, as to Alabama and Louisiana, in colonies which can create and protect their own public sentiment.

The Southern Woman, official organ of the Georgia Federation of Women's Clubs, publishes an "Open Letter" to THE INDEPENDENT, correcting a statement of ours that the Georgia Daughters of the Confederacy are included in the Federation. As *The Southern Woman* is also the organ of the Daughters of the Confederacy we fell into the mistake which we are glad to correct. The constitution of the Federation is "non-sectarian and non-political." Of the Daughters of the Confederacy there are in Georgia 75 chapters, besides 16 children's chapters, and gold medals are offered to boys or girls writing the best essays on subjects designated by the local chapters. Thus the memories of the Civil War are perpetuated to the next generation, just as in French schools the children are taught to repeat, "Remember Alsace and Lorraine!"

The football season ended last week. We have not the figures before us, but our impression is that under the new rules which have governed this season's play the casualty list of bruises and deaths is as large, if not larger than ever. Moreover, as a result of these rules, there was no perceptible change in the style of play—certainly no more open play, or less massing at the center. We see no reason, therefore, to modify our advice given at the end of last season, that the distance should be increased from five to ten yards which the team with the ball must gain in four downs. This change would lessen the bruising, battering mass plays, where the runner with the ball never expects to gain more than the fall of his own length, and it would tend to develop more kicking and trick plays, instead of the monotonous "straight football" style of game.

The other day a man was to be tried in New Orleans for the murder of a district-attorney. There were 311 talesmen summoned for jury duty. Of these 110 declared under oath that they would not condemn a man to death for any crime, and 56 others that they would not convict on circumstantial evidence. That is, 166 out of 311, more than half the number, declared themselves unfitted to serve on a jury. They were asked if they would desire the death by law of one who murdered or ravished one nearest to them, and they said, No. But some of these men took part in the lynching of the Italians a few years ago. It would appear that this tenderness of conscience was temporary, and only lasted as long as there was danger of being called from business to do jury duty.

We observe that just a little more than usually the papers are discussing the perennial demand of some of our Catholic fellow citizens that their parochial schools be supported by the public funds. It is an old question, long since settled, and we will waste no ink over it. The Catholics themselves are mostly satisfied with things as they are, and even their priests make little more than that sort of perfunctory complaint which the Pope makes against the loss of his temporal

power. While other countries are moving toward an undenominational school system, we are in no danger of going back to religious schools. For religious education we must trust the Church; we dare not trust the State.

There goes back to Congress from the Fourth District of Louisiana the Hon. Phranor Brazeale, whose residence is Natchitoches. We wish he could be made to explain, on the floor of Congress, why it was that he declared, when the colored people wished to erect a high school in that city a few months ago, that it should not be allowed; and when a committee, consisting of men whose names we can give, visited him on the subject, he declared that no such school should be built or operated in the town under any consideration. They had the land purchased years ago, and the lumber was on the ground.

We wonder if Congress can yet be persuaded to give protection through its courts to foreigners resident here, as so often recommended in Presidential Messages, and now proposed in Mr. Crumpacker's bill. It puts the trial of those guilty of lynching foreigners into the United States courts, instead of the State courts, and provides that no person shall serve on the jury known to favor the crime of lynching. It ought to pass.

The comment of President Roosevelt on Mr. Bristow's long report on the Postal frauds is what might be expected from a man of honesty and decision, who holds to the motto, "Let no guilty man escape," and who will not shield misdoing in his own political party. Politicians may not approve that kind of rugged indifference, but the people will like it.

One of our Catholic contemporaries is amused because we spoke of the Roman Catholic as "perhaps" the oldest branch of the Christian Church. It does not understand the "perhaps." We were thinking of the Jacobite Church, which may easily claim to go back for its founder to the first pastor of the Church in Jerusalem.

Insurance

The Course in Medico-Life Insurance at Boston University School of Medicine

FRANK ELLSWORTH ALLARD, M.D., in charge of the course in Medico-Life Insurance at the Boston University School of Medicine, writes us regarding it as follows:

"Life insurance has to-day reached such magnitude and become such a potent and permanent factor in human affairs that special instruction of this kind is not only opportune, but imperative. The insurance fraternity have long deplored the lack of thorough knowledge and intelligent appreciation of the special requirements of life insurance companies by the medical profession. Yale College has recently established a classical course of lectures in Insurance in general, but, as far as I know, Boston University is the only institution which has thus far provided for a systematic course of instruction in Medico-Life Insurance. The next course will consist of a series of twenty lectures intended not only to instruct medical students in the science and art of selecting risks for life insurance, but also to acquaint them with practical and valuable knowledge which has accumulated from the experience of life insurance companies."

The course as now outlined will begin with the origin and early history of life insurance. Statistics will be introduced showing its present magnitude and scope. There will likewise be a brief survey of its social conditions and an estimate of the value of human life. This will be followed by a consideration of mortality tables, their origin and development. The student will be instructed in the State and national health reports, which form the basis for estimating longevity. In this connection the reports of United States army surgeons and the experience of life insurance companies, disease and death factors, and "fatal diseases" from an insurance standpoint will be considered. One section of the course will have to do with the medical examiner and his special duties and responsibilities; what the expert methods for the examination of applicants are and how lives are selected for life insurance. It will be made to appear that premiums are based upon careful medical selection, that there is a certain expect-

ancy of life and that general rules govern the acceptance, postponement and rejection of risks. Some of the causes which tend to shorten life, such as hereditary tendencies, personal and family history, environment, habits, occupation, temperament and mortality, will be carefully studied. The same thing will be done with the methods pursued in medical examination. The influence that heart disease has upon the shortening of life and its relation to life insurance will have a place in the course.

The places that alcohol and narcotics occupy in the matter of life insurance risks will be found interesting, as will also the various methods of defrauding life insurance companies—viz.: suicide, substitution and false statements. In connection with the comparatively new feature of female risks a comparison will be made between male and female longevity. Childbirth, abortions, various forms of uterine disease will have careful attention in this connection. Child insurance will be accompanied by the statistics of mortality among children under fifteen. Lastly, there will be an analysis of the various forms of insurance requiring medical examinations, including life and endowment, health, accident, casualty and employers' liability. The course is certainly exceedingly comprehensive, and there seems to be an unlimited field in which the instruction received may be applied.

AN insurance company which covers losses because of frost is something of a novelty, even in these days of ever increasing insurance enterprise. Some of the English journals, however, mention such an enterprise as having been established in France, and which is about to extend its operations so as to write policies in Great Britain. The company to which particular reference is made is not named, but it is reported to deal only with agricultural produce, and in return for a stipulated premium will make good any loss which the policy holders' crops may sustain through the ravages of the frost. The advent of the company into this country will be awaited with interest on the part of both Eastern and Western agriculturists.

Financial

Unjust Discrimination

THE recent reduction of railroad freight rates to the seaboard on steel rails and other iron or steel products for export raises some interesting questions. Domestic demand having fallen off, the steel companies turned once more to the export trade. Altho American railroads (and the American people) were still compelled by the pool agreement to pay \$28 per ton for steel rails, orders at much lower prices were sought abroad, and obtained—for example, one of 20,000 tons for Arabia, at \$22.88 delivered at Beirut, or something less than \$19 at New York; and another of 5,000 tons for Korea, \$20 at Pittsburg. The manufacturers then asked the railroad companies to reduce by 50 per cent. the freight charges to the seaboard on such products for export. Such a reduction would be about \$1.30 per ton from Pittsburg to the port of New York. A reduction of 33 1-3 per cent. has been granted, and this is equivalent to more than \$17,000 on an order for 20,000 tons.

Here is discrimination against our own people and in favor of foreigners by the railroad companies and the protected steel manufacturers—in one case by selling American goods abroad at prices lower by about 30 per cent. than those exacted at home, and in the other by carrying these goods at rates lower by 33 1-3 per cent. than American buyers and consumers must pay for similar service. Rails or structural steel to be used for municipal projects in the City of New York, for example, must be bought at the high pool rates, and the transportation from Pittsburg costs \$2.60 per ton; similar material brought from Pittsburg to New York for export pays only \$1.73 per ton and is sold abroad at prices 30 per cent. lower than those exacted in the city. Again, the Great Northern and Northern Pacific railroads must pay \$28 for rails, while the Canadian Pacific, paralleling those lines, can buy the same rails for \$20. The pool regulations impose no restriction on sales for export. It may be pointed out incidentally that the rail pool is controlled by the Steel Corpora-

tion, to which nearly two-thirds of the output is allotted. When these export and freight reductions are applied to raw or partly finished materials, such as billets and steel sheet bars, the foreign manufacturer who buys them gains a decided advantage over his American competitor in neutral markets.

Such discrimination is unjust to the American consumer. We are not sure that it is lawful; it is clearly at variance with the spirit of the Interstate Commerce act. The maintenance of high pool prices and high freight rates for home consumption while, as the manufacturers said to the railroads, "the iron and steel business of the entire country is in a depressed condition," tends to repress consumptive demand and to prevent a revival of it. At the same time it does not commend either the tariff or the railroads to the public.

THE Calumet & Hecla Mining Company (copper) has paid \$83,350,000 in dividends on a capital of \$2,500,000.

....Rich deposits of gold have been found in Alaska along the courses of several streams flowing into the Arctic Ocean and Kotzebue Sound.

....Exceptionally large crops of wheat are reported in Argentina and Australia. Argentina is preparing to export fresh fruit.

....Dividend disbursements of industrial companies in December amount to \$22,355,000, of which \$11,700,000 is paid by the Standard Oil Company.

....Dividends announced:

U. S. Leather Co., Preferred, \$1.50 per share, payable January 2d.

Buffalo & Susq. R.R. Co., Preferred, 1 per cent., payable December 1st.

Buffalo & Susq. Iron Co., 1st Mort. Coupons, payable December 1st.

Minn. & St. Louis R. R., Coupons, payable December 1st.

Iowa Cent. R'way, Coupons, 1st Mort., payable December 1st.

Rubber Goods Mfg. Co., Preferred, 1 3/4 per cent., payable December 5th.

International Paper Co., Preferred, 1 1/2 per cent., payable December 31st.

Peoples Trust Co. of Brooklyn, 1 per cent., payable December 1st.

The Independent

VOL. LV NEW YORK, THURSDAY, DECEMBER 10, 1903 No. 2871

Survey of the World

The President's Message

More than one-third of the President's long message is given to a consideration of the Panama Canal question and the work laid out by the laws that created the Department of Commerce and Labor and its Bureau of Corporations. "The question now," says the President, "is not by which route the Isthmian Canal shall be built, for that question has been definitely and irrevocably decided. The question is simply whether or not we shall have an Isthmian Canal." The essence of the condition in the Spooner act, he asserts, "referred not to the Government which controlled the Panama route, but to the route itself; to the territory across which the route lay, not to the name which for the moment the territory bore on the map." The treaty of 1846 "vested in the United States a substantial property right" in that territory, and the obligations of that treaty are binding upon us and the holders of that territory "as long as the Isthmus endures." In making the treaty with Colombia, the President says, we were more than just; "we yielded in all possible ways to her desires." But Colombia by unanimous vote repudiated the treaty which her Government had made. We had patiently served her interests on the Isthmus for more than 50 years; but when for the first time it became possible for her to do anything in requital, she peremptorily and offensively refused. Having briefly spoken of the revolt on the Isthmus, Mr. Roosevelt adds:

"The duty of the United States in the premises was clear. In strict accordance with the principles laid down by Secretaries Cass and

Seward, the United States gave notice that it would permit the landing of no expeditionary force, the arrival of which would mean chaos and destruction along the line of the railroad and of the proposed canal, and an interruption of transit as an inevitable consequence."

Since the treaty of 1846 was made, the Government of New Granada and Colombia had been "in a constant state of flux." The President sets forth a list of 53 revolutions and insurrections which have taken place on the Isthmus during the last 57 years. Colombia has been "utterly incapable of keeping order there," he says, and has retained her connection with the Isthmus only by our exercise of the police power in her interest. He quotes the extraordinary offer, recently made by "an eminent Colombian" [said to be President Marroquin], to declare martial law and ratify the Hay-Herran treaty, in return for the preservation of Colombian sovereignty on the Isthmus by United States troops. Following a brief summary of his narrative and argument, the President says:

"Under such circumstances the Government of the United States would have been guilty of folly and weakness, amounting in their sum to a crime against the nation, had it acted otherwise than it did when the revolution of November 3d last took place in Panama. This great enterprise of building the interoceanic canal cannot be held up to gratify the whims, or out of respect to the governmental impotence, or to the even more sinister and evil political peculiarities, of people who, tho they dwell afar off, yet, against the wish of the actual dwellers on the Isthmus, assert an unreal supremacy over the territory. The possession of a territory fraught with such peculiar capacities as the Isthmus in question carries with it obligations to mankind. The course of events has shown

that this canal cannot be built by private enterprise, or by any other nation than our own; therefore, it must be built by the United States. Every effort has been made by the Government of the United States to persuade Colombia to follow a course which was essentially not only to our interests and to the interests of the world, but to the interests of Colombia itself. These efforts have failed; and Colombia, by her persistence in repulsing the advances that have been made, has forced us, for the sake of our own honor, and of the interest and well-being, not merely of our own people, but of the people of the Isthmus of Panama and the people of the civilized countries of the world, to take decisive steps to bring to an end a condition of affairs which had become intolerable."

In the passages relating to the new Department at Washington, there is much with which the readers of the President's public addresses are already familiar. He speaks at length of the purpose of the new legislation concerning corporations—"not to embarrass or assail legitimate business, but to aid in bringing about a better industrial condition." Publicity "can do no harm to the honest corporation." With respect to both corporations and labor unions, the policy of the Government is to "draw the line on conduct." If either disregards the law or acts in a spirit of arbitrary and tyrannous interference with the rights of others, then, where the Federal Government has jurisdiction, it will see to it that the misconduct is stopped." In view of the decreasing surplus, economy is suggested. The Secretary of the Treasury should have liberty, Mr. Roosevelt says, to deposit customs receipts in the banks. He recommends that Congress direct the Secretary of the Navy, the Postmaster-General and the Secretary of Commerce to serve, with representatives of the Senate and the House, as a commission to inquire as to the legislation desirable or necessary for the development of the merchant marine and of a national ocean mail service of auxiliary naval cruisers. He asks with great urgency that the money given to enforce the Anti-Trust law be made available for the prosecution of postal service thieves, those who have stolen public land and those guilty of naturalization frauds, which, he points out, have been very extensive and flagrant. In a very brief reference to the islands,

he remarks that "the Philippines should be knit closer to us by tariff arrangements," and points to the encouraging "governmental, intellectual, moral and material advance" of the Filipinos. The navy should have a General Staff, he says, and promotion by mere seniority in the army should give way to a better method. A commission has been appointed to report as to needed changes in the land laws. The Alaskan Boundary award is "satisfactory in every way." Giving a brief history of the Venezuelan claims controversy, the President remarks that when it was suggested by the Powers that the dispute should be referred to him for a decision, he preferred that it should go to The Hague Court because it "seemed to offer an admirable opportunity to advance the practice of the peaceful settlement of disputes between nations," and to secure for The Hague Tribunal a memorable increase of its practical importance. "Our hopes in this regard," he says, "have been realized:"

"Such an imposing concourse of nations presenting their arguments to and invoking the decision of that high court of international justice and international peace can hardly fail to secure a like submission of many future controversies. The nations now appearing there will find it far easier to appear there a second time, while no nation can imagine its just pride will be lessened by following the example now presented. This triumph of the principle of international arbitration is a subject of warm congratulation, and offers a happy augury for the peace of the world."

The Field of Politics

In New York, ex-Senator Hill and Charles F. Murphy, the Tammany leader, appear to have reached an agreement concerning the State's Democratic candidate for the Presidential nomination. It is now understood that the State's delegates will vote as a unit for Judge Alton B. Parker, whose friendship for Mr. Hill will probably prevent the removal of the latter from the place of Democratic leader, altho the recent municipal victory was a defeat for the factional forces which Mr. Hill represented. The ex-Senator himself is no longer a candidate; probably he will lead the delegation. On the Republican side, in New

York, the work of reorganization is proceeding under the direction of Governor Odell. Senator Platt's chairman of the New York County Committee, Mr. Bruce, is about to resign. — Some notices given to the press in Ohio by Francis B. Loomis, Assistant Secretary of State, have led politicians to infer that the nomination of Governor-elect Herrick for the Vice-Presidency is desired by party leaders at Washington.—At the close of a long interview between the President and Senator Hanna, on the 4th, Secretary Loeb informed the press that the two statesmen were on the best of terms, and that reports of a break in their cordial relations were so preposterous that the President would make no further reference to them. Mr. Hanna does not appear to have decided finally whether he will remain at the head of the National Committee. Mr. Roosevelt holds that Perry S. Heath should promptly retire from the office of Secretary; Mr. Hanna defends Heath, asserting that he has been unjustly attacked in the Bristow report upon the postal service frauds. As the Senator (mainly in the interest of his friend, Estes G. Rathbone) is sharply at variance with the President with respect to the promotion of General Wood, some have expected a quarrel between him and Mr. Roosevelt, and, possibly, an active campaign by the Senator's friends in behalf of his nomination for the Presidency. There is no evidence, however, of such a disagreement. The prediction is still made that the condition of Mr. Hanna's health will not permit him to be chairman of the National Committee next year.

The Isthmian Canal Question The new Canal Treaty was ratified at Panama, on the 2d, without amendment. Arriving at Colon on the 2d, it was at once conveyed to Panama by the Junta's Foreign Minister, accompanied by Rear-Admiral Walker. On the following day it was approved and signed by the three members of the Junta and the several Ministers, and the following decree was issued:

"Whereas, a guaranty of the independence of the Isthmus has been obtained, and

"Whereas, celerity is indispensable to secure

an efficacious and immediate fulfilment of this obligation on the part of the United States; the Junta of the Provisional Government, formed by the unanimous will of the people of the Isthmus, and possessing full sovereign powers over the Isthmus territory,

"Resolves and decrees that the treaty be approved in all its parts."

It is expected that the agreement thus ratified will be received in Washington on or about the 15th inst. On the evening following this action of the Junta there was an enthusiastic popular demonstration in Panama. The Isthmian newspapers urge the Government to occupy several islands now controlled by the Department of Bolivar, and then to negotiate for a transfer of them to the United States as sites for coaling stations.—At Bogota, the Colombian Government has informed Minister Beaupré that it regards the "premature" recognition of the Panama revolutionists as a violation of the treaty of 1846 and of international law; also that a Colombian army is marching to the Isthmus and will be victorious there if the United States does not interfere. He added that if it should interfere, the independence of the Isthmus would be inevitable, altho it would not be accomplished by the people. But there is no army on the march, and at last accounts the Bogota Government was awaiting the result of General Reyes's mission. It is reported that if it shall be ascertained that he has failed, small bodies of troops will make their way to the Isthmus and carry on guerrilla warfare there. These, it is thought, can be safely landed at certain points on the coast. Some reports say that great discontent prevails, and that a renewal of the Liberal revolt is expected. Minister Beaupré tells the State Department that the Hay-Herran treaty was rejected because it was objectionable in spirit and text, and that the instructions he received from Washington exerted not the slightest influence in causing adverse action. Colonel Torres, commander of the troops that were deported from Colon, is undergoing trial by court-martial, and it is predicted that he will be sentenced to death.—When General Reyes arrived at Washington he had a very confused idea of the situation. He soon realized how formidable his task would be. On the 1st, Minister Herran was advised by

Secretary Hay that the basis of any conference with General Reyes must be an understanding that the United States could listen to no propositions concerning the canal or the subjugation of the Isthmus, and would only consider the use of its good offices for a peaceful settlement of all differences between the Republic of Panama and the Republic of Colombia. On the 3d, General Reyes and Minister Herran lunched with the Secretary at his home, and the subject was informally discussed. It is said that General Reyes has reported to Bogota that he can do nothing, because the United States is determined to maintain the independence of the Isthmus and make a canal under the new treaty.—A prominent press correspondent at Washington asserts that it was known to our Government that France was ready to intervene on the Isthmus for the protection of the canal company and its concession, and intended to do so if we did not take action there for the preservation of peace. He also says that the attitude of France was known to the revolutionists. France, it is said, resented the apparent purpose of Colombia to revoke the extension of the Canal Company's concession, and our Government's prompt action averted any complications that might have been caused by French intervention, altho such intervention in behalf of the Canal Company would have been preceded by due notice to us that any violation of the Monroe Doctrine would be avoided.—Germany has formally recognized Panama as a sovereign and independent Power. Great Britain and the Netherlands are still restrained from taking such action by the protests of the owners of Colombian bonds, who hold that the new Republic should assume a part of the old debt. Mr. Roosevelt is said to agree with them about this. Answering the plea of Panama that the debt was incurred before she became a part of Colombia, the bondholders say that she declared her independence in 1821 (asserting that she belonged to Colombia), and that the money was borrowed in 1822 and 1824, to carry on the war for independence. On the other hand, it is now said at Colon that the Bogota Government has received from the Isthmus, chiefly for canal and railway privileges, more than \$9,000,000, all of

which has been expended elsewhere.—Four Colombian military officers, who took the oath of allegiance to the Panama Republic at the time of the revolt, were deported from the Isthmus on the 5th, having been accused of conspiring recently against the Republic and General Huertas, the commander of its army.

Congress and National Topics

Resenting the Senate's refusal to take final action upon the Cuban Treaty bill until the 16th inst., the House, on Saturday last, adjourned to meet at noon on Monday, the hour for the beginning of the regular session, thus declining to provide for a brief intervening recess, which the Senate had suggested. In executive session, Senators expressed their disapproval, Mr. Bailey saying that the House was acting in a "childish" way. Serious complications arise in relation to the army nominations and promotions, which were recess appointments. A large number of changes have followed the promotion of General Wood. Upon this promotion no action has been taken, nor has the Senate voted upon the appointments of more than 150 officers ranking below him. The President decided to submit all these appointments again at the regular session, but some say that they, as thus renewed, cannot be "recess" appointments. Questions as to pay and rank which seemed to be settled are thus raised again.—In nearly all cases, the new House committees announced last week, retain their old chairmen. It is noticeable, however, that the Post Office committee (Mr. Overstreet, of Indiana, being chairman in place of Mr. Loud, defeated at the polls) has been reconstructed. Nine of its present members were not connected with it in the preceding Congress. Mr. Cannon was unwilling that the District of Columbia committee should be controlled by members from the adjoining States of Maryland and Virginia. It contains no Maryland man and only one Virginian. This change may affect plans for extensive public improvements. In the Speaker's room, Herman J. Schulteis, legislative agent of the Knights of Labor, insinuated in

conversation with Mr. Cannon that the Labor Committee had been "packed" against labor interests. After he had made other offensive remarks, the Speaker caused him to be ejected and gave orders that he should never again be admitted.—Ratification of the Isle of Pines treaty has been prevented by Senator Penrose, who asserts that American colonists and investors on the island were misled by General Wood.—Senator Foraker says that there should be free trade between the Philippines and the States, and that the Republican Party has nothing to fear from a full and free discussion of the tariff at the present time.—In a report to Secretary Root, General Young, Chief of Staff, points to the practically unanimous testimony of officers of all grades that the anti-canteen laws forbidding the sale of beer and light wines at post exchanges has caused "increased drunkenness, increased desertion, and generally increased insubordination."—At a meeting in Washington last week, at which Admiral Dewey, General Miles and several prominent civilians were present, steps were taken to awaken popular sentiment in favor of an arbitration treaty with Great Britain. On January 12th, a meeting of the National Arbitration Committee will be held in that city to consider this subject.—At the hearing concerning General Wood's promotion, General Brooke testified, last week, as to instances of insubordination on the part of General Wood when the latter was at Santiago, saying that Wood repeatedly sent official communications to the Department over his (Brooke's) head, argued against his orders, and opposed his recommendations for the suppression of newspapers in which he (Brooke) was bitterly attacked. The testimony of Horatio S. Rubens, formerly counsel for the Junta and associated with General Wood, tended to confirm Major Runcie's statement as to Wood's responsibility for the *North American Review* article. Mr. Rubens said he would not accept Wood's word as to any matter in which the latter had a personal interest. Inconclusive testimony was given as to General Wood's association with and

commendation of one Bellairs, a press agent, who had successfully concealed from his employers the fact that he was an ex-convict. Ray Stannard Baker, who brought Runcie's article to New York and caused it to be published, contradicted Runcie, denying that any agreement had been made with Wood during a dinner or at any other time as to the use of such an article.

Labor Questions

The Supreme Court of the United States has affirmed the constitutionality of the eight-hour law of the State of Kansas, Chief Justice Fuller and Justices Brewer and Peckham dissenting. This statute, enacted in 1891, provides not only that eight hours shall constitute a day's work for workmen employed directly by the State or any county or municipality, but also forbids contractors to require more than eight hours from laborers engaged on work for the State. The appeal from the Kansas courts was taken by a paving contractor, who alleged that the statute denied him due protection of the law and deprived him of his property without due process.—In New York, Timothy McCarthy, a walking delegate recently associated with Samuel J. Parks (who is now in prison), was convicted last week on the charge that he extorted \$300 from an employer for terminating a strike. Remarking that McCarthy had been a tool of Parks, the judge sent him to the Blackwell's Island penitentiary for a year.—The Executive Committee of the new Citizens' Industrial Association has decided that the members shall refuse to place union labels on goods of their own manufacture.—Eight boys, arrested during the street railway strike in Waterbury, Conn., several months ago, were tried last week for conspiracy to assault the non-union employees of the company, convicted and sent to jail for ten months.—In Colorado, where strikes have been in progress at the gold and coal mines for a long time past, Governor Peabody has proclaimed martial law for the county that includes Cripple Creek. All the State's militiamen are now in the field. The Governor declares that Cripple Creek is in a condition of rebellion. General Bates reports to the War Depart-

ment that the disturbances at Cripple Creek and Telluride amount to an insurrection against the State, but that Federal troops thus far have not been needed.—Judge Holdom, of Chicago, decided on Saturday last that a local union of press feeders was guilty, as an organization, of violating his injunction against picketing and patrolling ten printing houses. A fine will be imposed.—The number of cotton mill employees in New England thus far affected by the 10 per cent. reduction of wages is 75,000. A reduction of 12 per cent. has been ordered in the wire mills of the Steel Corporation, and a much larger reduction in several tin plate mills.

Pay for the Cuban Army

A committee of the Cuban Senate has accepted substantially all the changes in the loan bill that were recommended by President Palma at the suggestion of capitalists in New York, with whom the proposed loan of \$35,000,000 will probably be negotiated. President Palma will be authorized to pledge a part of the customs revenue as security for the loan. It has not been decided whether the bonds issued by the revolutionists in 1896 and disposed of in 1898 shall be paid out of the proceeds of the loan. The par value of these bonds is \$3,100,000, and the interest unpaid amounts to 33 per cent. The price of them on the "curb" market in New York rose last week from 35 to 70. There is a strong popular demand in Cuba for a Government lottery to meet the expense of the loan, and a bill for such a lottery is pending in the House. Probably it will be passed, but President Palma will veto it. The demands of the veterans of the Cuban army greatly exceed \$35,000,000. As based upon the army lists, they amount to about \$52,000,000, and to this sum the civilians employed by the revolutionary Government desire to add claims that would increase the total to \$70,000,000.

English Affairs

When Mr. Balfour reconstructed his Cabinet, after the friendly withdrawal of Mr. Chamberlain, that he might devote himself to a campaign of education of the electorates, and the less friendly resignation of several other distinguished

members, it was supposed that there would soon be a Parliamentary election to secure a "mandate from the people" on the question of preferential and retaliatory tariffs and the giving up of the settled British doctrine of free trade, with a view to a closer union with the colonies. But it is now declared that Parliament will not be dissolved, and that it may run its course for two years longer. Meanwhile Mr. Chamberlain has announced that he will make no more speeches, after the two now engaged, for a long while, but will devote himself to a campaign of correspondence. This act of his, with Mr. Balfour's decision not to dissolve Parliament, is naturally interpreted to mean that Mr. Chamberlain's campaign has not been as completely successful as was hoped, and that there is reason to fear that an election would give the Government to the Liberals, now that they have the cry of a free loaf to add to that for undenominational public schools. Mr. Chamberlain, who is in his sixty-sixth year, and perhaps cannot keep up the strain of these last months, declares himself more hopeful than ever, but must give his time to Parliament, correspondence and the Tariff Reform League.—Perhaps quite as important as any news about Mr. Chamberlain and Parliament is the report of the dangerous sickness of Herbert Spencer. He is in his eighty-fourth year, and has for some time been in enfeebled health. He is universally recognized as the greatest of living English philosophers, and his influence in education has been as great as in philosophy and science.—The House of Lords has decided that women are debarred by their sex from becoming qualified lawyers. The decision was on the appeal of Miss Bertha Cave from the decision of the Benchers of Gray's Inn, who refused to receive her as a student, with a view to being admitted to the bar. The House of Lords decided that there is no precedent to admit a woman, and no reason to create such a precedent.—It is officially stated that the British Government has purchased the two battle ships under construction for the Chilean Government, for which Chile had no use after her treaty of arbitration with Argentina. These are the vessels which it has been variously reported had been

purchased by Russia and Japan; and it has even been declared that their design would not admit them to the British navy. The price was \$9,375,000.

The Reichstag Opened

The Emperor William was unable to attend the opening of the Reichstag, and his Message was read by Chancellor von Bülow. The members go to the royal palace in court costume, and stand before the throne, and at the end of the speech cheer the Emperor. But the Socialists refuse to attend, and as twenty-five of them in the last election replaced Royalists, the number present was less than it has been. The Message expressed thanks for the sympathy shown the Emperor in illness, and proceeded to state that the general financial depression had unfavorably affected the imperial finances. The Government did not now propose to increase the army, but must somewhat increase the salaries of officers on account of the enhanced cost of living. Mention was made of the Emperor's interviews with sovereigns of other nations in the interests of peace in the Balkans, and it was declared that Germany has done its part to prevent the outbreak of war. The Message was favorably received, because it made no unusual demands on the taxpayers for the increase of the army, nor did it propose any controversial legislation as to foreign treaties, such as is desired by the Agrarians. To the surprise of the Royalist parties the Socialists agreed to support Herr Singer for First Vice-President. It will be remembered that this was the chief question discussed in the late Socialist conference, and that it seemed to be settled that the Socialists would nominate no Vice-President, as it might be one of his duties to propose cheers for the Emperor. They have, however, come into accord on this most vexed question, thus going over to the side of practical politics. The health of the Emperor still excites alarm, inasmuch as little faith is put in the assurances of the physicians. It is declared that the healing of the vocal cords progresses very slowly, and that the Emperor's general health has suffered from his exhausting energy so long continued and that it will be necessary for him to

take a long rest. The latest reports discredit the alarming rumors.

Abbe Loisy at Rome

An internal conflict of no little importance in the French Catholic Church is renewed by the advent of the new Pope. Cardinal Richard, Archbishop of Paris, was greatly scandalized by the teachings of the Abbé Loisy in his little work, "The Gospel and the Church," which was written as a reply to Professor Harnack, from the point of view of a liberal Catholic who accepted the conclusions, in good part, of modern historical criticism. The Archbishop condemned it and forbade its circulation, but did not succeed in having it formally condemned by the Congregation of the Index at Rome. He has lately visited Rome for the purpose of securing such a condemnation, and the issue is not yet settled. French scholars are watching the case with great concern, and one of them declares:

"The condemnation or absolution of Abbé Loisy will in reality mark the end of the Roman Church or its renaissance. It will constitute the close of nineteen centuries of faith or the prelude to a new form of worship."

Yet it must be remembered that no such catastrophe to the Church followed the condemnation of St. George Mivart in England for his scientific heresies. Cardinal Richard has forbidden the pupils of the seminaries in his diocese to attend Abbé Loisy's lectures at the Sorbonne, and has further commanded them to hand over to their superiors any of the Abbé's books which they may have in their possession, which is much like Archbishop Farley's interdict to Catholic seminarians to attend lectures at Columbia University, or Bishop McQuaid's forbidding Catholic young ladies to study at Cornell University. It is stated that M. Vigouroux, a distinguished French Catholic scholar, who is chairman of the Commission for biblical study appointed by Pope Leo XIII, was not at first a strong opponent of Abbé Loisy, and declared he would have found nothing reprehensible in the Abbé's "The Gospel and the Church," if it had been written in Latin and confined to a hundred copies; but he thinks that Loisy has gone too far in his later defense of it in "The Author of a Little Book."

Russia and Japan

The Powers chiefly involved in the acute Eastern question have seemed to do little "mark time" the past week. The present week ought to bring decisive developments. The mysterious illness of the Czarina, now happily recovered, has been one excuse for delay. It is also reported that the Czar himself has been greatly worried and almost unnerved by domestic and political anxieties. The recall of General Alexieff to St. Petersburg for consultation is also a cause of delay. But the Japanese Diet meets on Tuesday of this week, and great anxiety is felt as to the Emperor's speech and the decision of the Cabinet. Report has it that an agreement between the two Governments has been tentatively reached, on the basis long ago proposed, to give Japan predominant control in Korea and Russia in Manchuria, and this again is denied. Still no other settlement seems possible, and it is doubtful if Japan would accept as little as this. She remembers how she was forced to release her hold on Manchuria after her war with China. Russia is rapidly strengthening her hold on Manchuria, and has seized the treasury in Mukden and expelled the Chinese fiscal authorities. It is expected that Russia will not forbid the ratification of the treaty opening Mukden and Antung to foreign trade, but that means will be found so to hamper foreign trade as to give all the commercial benefits to Russians. It is reported from St. Petersburg that the Russian reply to the Japanese demands, so long delayed, is prepared, and that it is hopefully peaceful, altho it suggests some modifications. It is more clear that Russia is not ready for war, and that she is surprised at the insistence and courage of the Japanese Cabinet. Yet the Cabinet falls behind public sentiment, which demands energetic action and no submission. Public meetings and speeches at public dinners all look to war if Japanese rights are infringed. The danger of revolutionary outbreaks in Russia is still reported. A million copies of a proclamation to the peasants denouncing the Government have been distributed, and the chronic distress, due to bad harvests and lack of employment, inclines the people toward revolution. What alarms the Govern-

ment most is that in some recent outbreaks, as at Kieff, the soldiers refused to fire on civilians. The movement of Chinese troops to the Manchurian frontier has alarmed the Russians. There was a recent collision between a company of 300 Russian soldiers and a Chinese force in a region supposed to have been evacuated by the Russians, in accordance with the convention, and a dozen Russians were disabled. Japanese officers are drilling the bodyguard of the Empress of China. Indeed, an imperial edict establishes a central bureau to secure uniform military drill throughout China, and Prince Ching and the Viceroy of Chihli are at the head of it.

The South African Labor Question

It has been definitely concluded by the Commission appointed to propose a remedy for the lack of labor in the South African mines that the only recourse is to the importation of Chinese coolies. The native Africans seem to be dissatisfied and prefer other kinds of work, for which they are in demand, as farmers or house servants. The effort to secure a supply of negroes from more distant colonies has failed. It was attempted to employ discharged white soldiers, but they are not used to such steady and hard labor, and they were not satisfactory. Apparently the unwillingness of the negroes to work in the mines is not from any increased disinclination to labor, but from a somewhat rapid improvement in their condition and demands through education and civilizing influences. The regulations proposed for the importation of coolies will guard their interests, and provide for their return. It is desired that coolies from North China might be secured, but it is understood that the large supply must come from South China, if the Chinese Government consents to allow any to go. But an English report declares that the Chinese Government has decided to refuse to allow the recruiting of laborers in any part of China for the South African mines. This decision is said to be prompted by resentment against Canada, Australia and New Zealand, which have adopted anti-Chinese legislation. Canada has lately levied a heavy poll tax on Chinese entering the Dominion.

Colombia and The United States

BY GENERAL RAFAEL REYES

[General Reyes, who has arrived in Washington at the head of a Commission representing the United States of Colombia in regard to the Panama question, is one of the most notable personalities of South America. For years he has occupied a prominent position in his own country and has been often mentioned for the Presidency. He is known as a military expert as well as for his knowledge of diplomacy. He is one of the world's greatest travelers, having actually explored South America from Panama nearly to Cape Horn, and was one of the first white men to visit the head waters of the Amazon and its tributaries. He is of Spanish ancestry but obtained most of his education in the United States.—EDITOR.]

I HAVE come to this country representing the United States of Colombia and authorized by that Government to negotiate with yours relative to your control and construction of the Panama Canal. I am instructed to make certain propositions, which will be ratified by my country if they are accepted by the United States. The nature of these propositions I do not feel at liberty to make public until they have been presented to the proper officials and acted upon. I can make this statement, however, that I am not here to talk about money in connection with the canal. Personally, I feel that the United States should be given the right to complete the waterway, also the right to control sufficient territory on either side, without any money consideration. I wish it understood, however, that this is my individual opinion, and that when I say this I am not speaking as representing the Colombian Government.

It hardly seems necessary to say that Colombia wishes the canal, for its advantages to us are so apparent. It will greatly assist in the development of the country, not only from a commercial, but an industrial standpoint, and will attract the attention of the people of the United States to our resources as well as the other great waterways with which we are provided; but the sentiment of the majority of our people may have been misunderstood on account of events which have transpired and which, unfortunately, have cast discredit upon us through the acts of a few unscrupulous politicians. They have no further influence, however, and the party which at present controls the policy of the republic, I can say without exaggeration, represents the better

class of citizens, who are interested in the welfare of the country and realize what the building of the canal means for its progress. This party is by far the most influential in numbers as well as character, and has the confidence and support of the great mass of the people, who approve of the measures which it takes.

Again, speaking personally, I would have no objection to the United States being given absolute control of the territory through which the canal passes. If the United States Government should desire a belt five or ten miles in width, I think it would be wise to make it this concession. I do not think there would be any objection to the settlement of the land not needed for canal purposes by citizens of the States, altho it is a question if this portion of the Isthmus would be sufficiently healthful for permanent occupation. I merely speak of this to show that the occupation of any part of the Isthmus by the United States is not regarded as a menace by my country. As to the canal itself, we feel that the American people are the ones who should complete it, and have no doubt as to their ability to do so. From what I know of the work which has thus far been done I should estimate that about 60 per cent. of the route remains to be finished. Of the portion of the canal already excavated comparatively little will have to be repaired in order to place it in condition for use.

Not only Colombia but the other countries of South America also are deeply interested in this matter, for they realize as well as we do what a change will be brought about, since the people of the western coast especially will be in direct communication not only with the United

States but also with Europe. Naturally they have followed the various developments closely, and I do not doubt but what they agree with us in our willingness to let the United States build and control the canal. They recognize the importance of Colombia and our position among the people of Central and South America.

It is possible that some of the citizens of the United States do not realize the significance of the friendliness of those whom I represent toward your plans for the Isthmus. When it is remembered that Colombia has a population of no less than 5,000,000, it will be appreciated that we can become a powerful ally if your countrymen desire our friendship. Regarding the question of military strength, we would have no difficulty in putting an army in the field of 100,000 men at any time, such is the public feeling in support of the present Government. This does not mean a force merely of infantry, but artillery and cavalry as well. The present equipment of the Colombian troops includes such weapons as Mauser rifles and Krupp cannon. With an army of this size I think it is safe to say that

we can preserve order in all portions of the republic and quell revolutions without difficulty. Regarding Panama, I am aware of the statements that the natural obstacles are such as to prevent a military force of any size entering this territory from other parts of Colombia. While there may be no roads in the ordinary sense connecting the two portions of the country, Panama is by no means inaccessible, and an army could readily penetrate it by means of the routes of travel which already exist, for the Colombians are accustomed to traveling in country which is fully as difficult as that on the border of Panama.

There is nothing to conceal relative to my mission to the United States, and I have no objection to stating my position as frankly as possible to the American people through THE INDEPENDENT; but, as I have already said, the propositions which I am authorized to make to adjust the questions at issue between the two republics I do not feel at liberty to disclose until they have been submitted to the proper representatives and acted upon.

WASHINGTON, D. C.

Eastern and Western College Students

BY E. BENJAMIN ANDREWS

CHANCELLOR OF THE UNIVERSITY OF NEBRASKA AND EX-PRESIDENT OF BROWN UNIVERSITY

IN a broad view of American college students East differs from West but slightly. Between a group of Eastern students and a group of Western students resemblances are far more numerous and striking than dissimilarities. It would be much easier to take either set for the other than to take either for students from German, English or Scotch universities. And any brief statement of such differences as do exist is not a little precarious. Where so much depends upon the shading, it is difficult to be concise without exaggeration. Besides, contrasts true fifteen or even ten years ago either no longer hold good or are, at any rate, much attenuated.

The students whom I instructed on first

working in the West impressed me as generally of larger personality and power than their Eastern mates. Perhaps they did not follow so high ideals, but they exhibited more persistency and momentum. If they were not in all ways more serious, they showed more energy and will. They were often raw in manner and deficient in elementary studies. They may have been as a class somewhat lower in the *noblesse* which *oblige*, but they were superior in general morals and in personal purity. They were a thoroughly select class, including very few who had come to college because of being sent, or wished degrees for the mere honor of possessing such.

In the last decades conditions have

somewhat changed. Many Western students now are wholly supported by their parents, among them being a few shirks and degenerates, tho not so many, proportionally, as one meets in Eastern institutions. Intentional dishonesty in college work is even now, I think, less common West than East.

Dishonesty is still met with, due largely to the fact that high schools unwittingly condone and sometimes even encourage literary theft by confusing declamation with ostensibly original oratory. In oratorical contests and debates, too, form is praised more than substance—flower-pot finish of style above freshness, independence, genuine self-expression.

Eastern and Western college students cherish to a degree different aspirations touching college life. In the East, among undergraduates and in the public at large, there is still a general impression that a college education is in part a social affair, a sort of "finishing school" for men of the world, and, in part, so far as it is serious, a demand of culture, with only a rather remote bearing upon the question of a livelihood. The Westerner, on the contrary, believes such an education to be a necessary, at all events eminently useful, preparation for the practical activities of life, and where he does not find it so he is disposed to bend the curriculum and make it so.

In cleverness, versatility, *savoir-faire* the Eastern undergraduate is, I should say, speaking generally, superior to the man from the prairie; in application, knowledge of his subject, character, he is, to my mind, something the inferior. Also, a Western student belonging to the influential or the most conspicuous class of college men is more likely than an Eastern college man similarly placed to be or to assume to be without illusions, cynical, incredulous, even irreverent, tho fortunately these affectations often appear to be but incidental to the stage of growth.

Among Western students generally regard for religion is both more common and more sincere than in similar circles East. Part reason for this is the example and precept of devout professors elected to their places solely on account of their ability and reputation, whose religious attitudes and influence are therefore in

no sense official; whereas, at nearly all the endowed universities, the students, rightly or wrongly, understand that in selecting men for faculty positions the authorities still have considerable reference to creed.

The presence and Christian co-operation in each great State university of students representing all denominations and phases of belief is doing perhaps more than any other agency now at work to produce that charming catholicity which is among the chief glories of present Christianity in America. Contrary to what some imagine, this does not beget indifference to religion or weaken denominational loyalty, but it beautifully tempers and rationalizes denominationalism, tending to that essential unity throughout Christian society which all good people must desire.

Noteworthy, this choice development of Christianity has occurred and is still going on quite independently of special church agencies, such as chaplaincies and missionaries, so liberally provided for in other lines of religious militancy. Is there not, in this, evidence, somehow, of ecclesiastical oversight?

Mainly in consequence of the tendency, at the East, to view a college education as in part a social thing, it results that a large proportion of Eastern students belong to the leisurely class, almost unrepresented in the Western college—often to the great advantage of the Western institution, tho not wholly so, inasmuch as a man who is not particularly industrious sometimes has an excellent tradition behind him.

I often wonder, paradoxical as it may seem, whether our Western students are not taking college life too seriously, in danger of confining themselves overstrictly to class-room work, of coming to believe in an education as a sort of secret charm to proceed from their instructors, instead of a grace to be operated within themselves by their own efforts. Freightened with his tasks, even a little oppressed by them, the Westerner certainly runs risk of losing that nimbleness of wit and vivacity of spirit for which Eastern students are noted.

The lack of leisure to which his tireless industry condemns him is certainly, in one light, a decided disadvantage. For,

while he may excel the Easterner in his knowledge of some chosen subject, he is by no means so well read. His mind has scant time for that free play about its own ideas which Matthew Arnold praises so highly, or to multiply points of view whence he may see and judge himself, as it were, from the outside. There is also paucity of material for this, partly due to neglect of classical studies, which, unfortunately, have passed into greater desuetude "out West" than nearer the seaboard. Students' bent, at the West, is prevaillingly practical and scientific rather than literary.

The Eastern student has in his composition a certain vein of humorous mockery. Turned against others, this is a most objectionable characteristic, but when used for purposes of self-criticism it becomes a means of correction and balance, saving many from an excess and extravagance.

For lack of proper leisure the Westerner's manners—I do not refer to politeness and kindly feeling, both of which he exhibits, as a rule, in exemplary measure, but rather to his sense of the suavities, of the elegances of life—have not been whetted to the same edge as shows itself in Eastern college circles. In fact, he has for such matters a contempt which I should be inclined to view as, to a certain extent, rather healthy, tho it not seldom annoys faculty members fresh from the East. In conversation he is familiar, frank, blunt. If he knows his teacher well, he often greets him with an unconscious, ultra-democratic "Hello!" If he does not like you or disagrees with you he may call you to account in the college paper with a criticism of the "freelance" order such as is unknown in the New England college. In his entire manner the Western student inclines to the brusque. His sense for merely academic proprieties is not nice. His reverence for form is but imperfectly evolved.

He possesses, however, more regard for law and order, being less inclined to "cut up," play pranks on his instructors or bother the police—things which led Noah Porter to picture the college president as a man sitting over a volcano and knowing neither the day nor the hour when the next eruption would come. Of such solicitude Western college presi-

dents experience little or nothing. In many a State university "government" over students simply doesn't exist, not being demanded. Each student goes his way and attends to his duties like a gentleman, it never occurring to him to behave in college in any way which would cause him censure at home. The presence of women in these institutions largely contributes to this happy condition.

Tho the average Western student brings to his college work more enthusiasm, he does not come to it so well prepared. His home training has left much to be desired. He may never have heard, at home, a correct English sentence, possibly never any English at all. His schooling has been gotten in too great haste and often under inferior teachers. His general information is scanty. He has heard little first-rate public speaking. In frequent cases he also hurries through college, leaving with less cultivation than the Eastern graduate carries away. In connection with his assigned tasks he reads inordinately, terribly, with pain, taking notes all the while in the most diligent and devoted manner imaginable.

He too closely reminds one of the eager student who had come to join Faust's class and was counseled by Mephistopheles:

"Prepare beforehand for your part
With paragraphs all got by heart,
So you can better watch and look
That naught is said but what is in the book.
Yet in thy writing as unwearied be
As did the Holy Ghost dictate to thee."

Outside his prescribed lessons the Western college man reads far too little. For the best literature both his thirst and his taste remain undeveloped. He is less likely than his Eastern brother to keep track of the world's work through the press. For the king's English he has too little respect, writing and speaking with more vigor than correctness or ease. His chronic hurry is again evinced by many crude abbreviations in his written work.

If the Western college student is in culture scarcely the peer of his Eastern contemporary, he quite balances the account by superior mental power—I am, of course, all the time speaking of the usual or average case—and by greater industry. Western youth can boast as good blood and ancestry as Eastern. The best

immigrants to the United States have settled in the West, and their numerous children and grandchildren attending universities are among our most promising students. Western men and women put forth effort more naturally than the scions of families who have been well-to-do for generations. They possess the will for it and also the strong physique. Never have I seen in the East, save in professional and graduate schools, such desperate and unremitting application to study as characterizes the mass of students in the prairie States.

Western students generally display a veritably insatiable hunger for higher education. In them survives the spirit of their pioneer fathers, who, before they had places to lay their heads, taxed themselves to build schools and equip universities. Western students attend college to learn rather than to be taught. They average to study many more hours a day than Eastern. The typical college idler is never seen here. With eagerness for knowledge the Western student combines a zeal and a power for hard work seldom, if ever, witnessed in Eastern institutions.

The outside "seminar," to cram men for "exams," reducing the necessity of study to a minimum, and turning into a farce so much undergraduate "work" at

the oldest of our universities, the West has not adopted.

This assiduity in mental toil—often under the greatest obstacles—is an invaluable discipline, not only intellectual but moral, tending to form and settle a young man's character as desultory study could not possibly do. It is not astonishing, then, that the Western collegian should display not merely much the greater power of concentration, but also the more earnestness morally. This shows itself as well in his general as in his collegiate life. The moral weight of the average university student is among the things that have most impressed me in my experience West.

Native ability, enthusiasm for knowledge, coupled with the power for study which their strong physiques impart, and their readier submissiveness to discipline, all attested by the goodly number of fellowships which Western men and women hold in Eastern graduate schools, assure the coming generation of Western scholars a prominent place in American mental life. These are some of the reasons why, as a New England college professor (not a professor of rhetoric) has put it, to continue as our chief purveyor of highest educational products "the East has got to get onto her job."

LINCOLN, NEBRASKA, NOV. 24, 1903.

Helplessness

BY JOHN B. TABB

In patience as in labor must thou be,
A follower of Me,
Whose hands and feet, when most I wrought for thee,
Were nailed unto a tree.

ST. CHARLES' SEMINARY, ELLICOTT CITY, MD.

English Politics and Personalities

BY JUSTIN MCCARTHY

I AM decidedly of opinion that Mr. Joseph Chamberlain must be now one of the happiest men living in England, or, indeed, anywhere in the world. He is more talked about in this country than any other man. The daily and weekly newspapers are always writing about him, our public men on either side of politics are making speeches about him, nothing can wholly distract public attention from him, those who are not for him are vehemently against him, and households which used to be quiet and happy up to this time are now distracted and divided into hostile argumentative factions because of him.

Now to those who know anything of Mr. Chamberlain personally it must seem clear enough that this is the very condition of things calculated to give him thorough delight and self-satisfaction. I am not about to enter into any disquisition as to Mr. Chamberlain's personal merits or demerits, but I think it will be admitted by all who have had any opportunity of studying his career and character that he is decidedly a very ambitious man who delights in finding himself the center of public observation. Arthur Balfour, Lord Rosebery, Sir Henry Campbell-Bannerman, Sir Michael Hicks-Beach, the Duke of Devonshire, Mr. Asquith, and all the other prominent Parliamentary leaders on both sides of the political field count for little or nothing as compared with Mr. Chamberlain where public attention is concerned. No one can yet tell how this present crisis may end, and we do not seem just now to be moving with as much rapidity as might have been expected toward a decisive settlement. But whatever may come in the immediate future, whether Chamberlain is created Prime Minister or fails in his enterprise and comes to a fall, I think it may be taken for granted that at the present moment he must feel that he has attained the supreme point of his earthly ambi-

tion. What, after all, is the settled position of a mere Prime Minister compared with the sudden elevation of a man on whom the gaze of a whole people is turned and of whose every movement it may be said, as is said of "The Roaring Girl" in a famous Elizabethan drama, that "no blazing star draws more eyes after it."

Until the General Election comes we cannot possibly tell how far Chamberlain has really got hold of the country's solid and sedate public opinion. I observe with some satisfaction that the contributors with pen and pencil to *Punch*, a publication which generally contrives to keep itself on the winning side, are engaged indefatigably week after week in caricaturing him and turning him into ridicule. But even if *Punch* should be right in its estimation of public opinion, it must still be felt by Chamberlain as an immediate conquest and triumph that he thus succeeds in occupying the pages of *Punch* for week after week to the exclusion of so many other seemingly important subjects and personages. As I heard Horace Greeley once say, "the past is always secure." For the present Mr. Chamberlain has the talk of the English world all to himself, and even if he should never become a strong and successful Prime Minister, he can always proclaim that he has had his day and his triumph.

Of course, we must always take into account the possibility that Mr. Chamberlain's most resolutely expressed opinions may undergo a sudden change. When he first came into the House of Commons and for long after he was a Radical of the Radicals and might, indeed, almost be described as a republican in his political doctrines. He used to denounce aristocrats and land-owners with something like the fervor of an anarchist. He professed the most sympathetic interest in the Irish National cause and was the

ostentatious ally of Charles Stewart Parnell. Thus he made himself indispensable as a Radical member of a new Liberal administration, and having got so far, his opinions seemed to undergo a change. He seceded from Gladstone on the Home Rule question and, indeed, after a while, on all other questions with which Gladstone had identified himself. He became a Tory of the Tories, and in the natural course of things, considering his genuine capacity as a political debater, he received a high position in a Tory administration. Then, all of a sudden, he came forward as the leader of a revolutionary movement against the fiscal doctrines of Adam Smith, of Sir Robert Peel, of Gladstone, Cobden and Bright, and John Stuart Mill. Should this crusade not work out to his full satisfaction, we may perhaps expect to find him on an early day the champion of some quite different set of political and financial doctrines. But for the present at all events it cannot be denied that he is the most conspicuous figure in English politics, and if I know anything of Mr. Chamberlain, I think I may venture to say that he enjoys his ascendancy to the full.

The death of Lord Rowton has removed one of the most familiar figures from English political and social life. Lord Rowton, before he obtained his title, was pleasantly known among his friends as "Monty Corry," Montagu William Lowry-Corry being his full name, and he was for many years private secretary to Disraeli. I used to meet him often some years ago, and he was one of the most delightful talkers I have ever known. He was long recognized as one of the established ornaments of London society. It was always understood that he was to be Disraeli's authorized biographer, and that he had obtained from his chief an immense mass of materials for the accomplishment of this work. Since Disraeli's death the world had been expecting year after year the appearance of this eagerly desired biography, and all manner of explanations had been suggested for the continued postponement of the book. I have heard it said lately—I mean since Lord Rowton's death—that Disraeli's own memoranda were so entirely cynical and satirical as regarding his leading Conservative associates in power that Lord Rowton did not think

it would be possible to publish the volume for the perusal of any but a yet distant generation. I do not, however, venture to say whether there is any foundation for this statement, because I have only just heard the story, and have no means of ascertaining what truth there may be in it; but it is, at all events, not absolutely inconsistent on the face of it with what we have all supposed to be the ways of Disraeli.

Lord Rowton did not, however, give up his whole life to the delight of London

LORD ROWTON.

society and the accumulation of materials for the biography of his brilliant leader. He had a sincerely philanthropic temperament, had done much to relieve the toils and the sufferings of the poor of London, and the Rowton Houses will always remain a monument of his activity in endeavoring to make life endurable for some of his humblest fellow creatures. These Rowton Houses are, in fact, a number of buildings intended as homes for the deserving poor, whom Lord Rowton wished to save from the degradation and demoralization of the crowded tenements, in which various families are herded together in a mass under one roof

in the poorest and lowliest parts of the great metropolis. Each Rowton House contained a number of flats, each flat to be occupied by only one family, and there was a further arrangement by which on something like the co-operative principle each family might be supplied with good and wholesome food at the lowest possible price. Lord Rowton would seem, one might say, to have been two human beings blended into one. The Lord Rowton of society was the charming dinner-out, the brilliant drawing-room figure, the keen politician, the shrewd and witty observer of life, especially in the houses of the great, while the other Lord Rowton was the philanthropist, whose heart and mind and purse were devoted to the service of the poor and the suffering. We may see many greater men than Lord Rowton in English public life before we see one other such man as Lord Rowton proved himself to be.

The most remarkable product of English fiction given to the world lately is, according to my judgment, Mr. Richard Whiteing's new novel, "The Yellow Van." In my last contribution to THE INDEPENDENT I mentioned the fact that this novel had just been published, and even ventured to assume that it would command a large amount of attention; but I had not then had time to read it all through and to form a full judgment as to its quality. I am now strongly convinced that it is one of the most remarkable novels we have had here for a long time, and that it is equal to the very best of Mr. Whiteing's former productions. It is a story of English life, the life alike of the rich and the poor, a story of a struggle between capital and labor, between upper classes and lower, and it is instinct everywhere with deep thought, with human feeling, and with a half-poetic insight into the heart. "The Yellow Van," which gives its title to the book, is a sort of caravan used by one of the working-class agitators as a means of propagating his doctrines by the delivery of speeches and the distribution of printed pages all over the country. We meet in this story with many figures belonging to higher life, according to the social meaning of these words, with the occupants of ducal castles and city palaces, and also with the denizens of village cot-

tages and town slums. I do not propose to give my readers any outline or any condensation of the story, and I only describe it thus far in order to show those who have not yet read it that it affords just the kind of subject with which Mr. Whiteing is well qualified to deal. The great charm of the book lies in its vivid and truthful pictures of human character in various forms and in the strength

RICHARD WHITEING

and the beauty of its style. The reader has to pause again and again over a few short lines of the page in order that he may allow the full meaning and charm of the passage to sink into his very soul. Yet "The Yellow Van" is not by any means what might be called a philosophical study of a great subject or an essay on political economy cast in the form of a romance. The story in itself is intensely interesting and even fascinating as a mere story and might be read with thorough pleasure even by one who had never made or desired to make a study of the relations between capital and labor. But, of course, I need hardly say that the book will be enjoyed most of all by those who, while acknowledging a deep interest in that most important sub-

ject, are yet capable of being touched by the charm of thrilling narrative and the genuine realization of human feeling. Mr. Whiteing's women are drawn with as vivid and as delicate a pencil as the best of mere romancists could apply to his figures, and his men always stand out as living and distinct realities and not merely as cleverly constructed types of a class. I have already mentioned the half-poetic charm which belongs to much of Mr. Whiteing's work in this book, and indeed it has sometimes seemed to me as if the whole work might be described by the once familiar phrase, "a prose poem." Here and there I have been reminded of some of the writings of Jean Paul Richter, that prose poet whom in my earlier days so many Englishmen and women, as well as Germans, used to regard with such fervor of admiration. I do not think I am carrying my estimate of "The Yellow Van" too highly when I make this comparison between some of its finest passages and many of those which are to be found in Richter's works. Mr. Whiteing has thus far had a somewhat peculiar career in literature. Many years ago he published, not indeed his first book, but his first novel, using that word according to its ordinary application. That first novel was called "The Democracy," and it was, according to my judg-

ment, a masterpiece in its way. Full justice was done to its remarkable qualities by many of our ablest and most distinguished critics, but the book somehow did not appeal to the outer public, to that which Thackeray once scornfully described as "the great big stupid public." So far as pecuniary success was concerned I presume it must have been a dead failure, but there were many who even then saw that it told the coming of a new literary force. Several years later Mr. Whiteing ventured on a second novel, "The Island," a story of singular beauty and power, and this was somewhat more widely read than the former, but did not meet with anything like the public success it deserved. Only quite lately, and with the publication of his novel, "Number Five John Street," did Whiteing obtain from the world of novel readers the full recognition of his genius. He said himself in his humorous, half-melancholy way that it was rather hard upon a man not to come in for a success until after he had passed his sixtieth year! Still, better late than never, and I hope and trust that my prediction in the last number of THE INDEPENDENT is already realized, and that "The Yellow Van" has driven beyond "No. Five John Street."

LONDON, ENGLAND.

Uncle Jimmie and the "X-Ray Doctor"

BY MRS. L. H. HARRIS

BY profession Uncle Jimmie was the stage-driver between Brasstown and Blue Ridge, two mountain hamlets in North Georgia; but by nature he was a dramatist. And, altho his coach was antiquated, his horses lean, and his speed a matter of weather or equine inclination, for twenty years he had successfully competed with every rival in the business; because no intelligent person acquainted with his adventurous spirit and powers of narration would patronize a less gifted driver, even tho he made the distance in half the time.

This was how a certain scribe, bound on a Nimrod vacation into Brasstown

Valley, came to hear of the old man's experience with the "X-ray doctor." It was near the end of a long day's drive. The Ridge lay behind them, a monstrous flock of blue peaks herded against the evening sky. The road wound downward like a dusty ribbon through the yellow autumn fields of the valley, and in the distance the village gleamed like a little white mirage of coming civilization. The jaded horses suddenly drew their ears forward into hopeful points of expectation and quickened their pace. Uncle Jimmie swayed rhythmically to and fro on the driver's seat like an old gray brownie. His shirt was open at

the throat, displaying a whiskery breast; his wool hat-brim flared back from an angry topknot of grizzled hair, his eyes squinted to narrow blue beams beneath shaggy brows, and his paunch rounded ludicrously above a pair of thin, short legs braced for speed.

"Yo' mout think the worst was over when we git 'long here," he remarked, spitting dexterously over the wheel and casting a glance at the solitary passenger lolling on the back seat, "bet hit hain't. The hosses is all right, they peerten up fer the home stretch, bet the passengers is wore out, an' these las' five miles look to them longer 'an t'other twenty. Ef hits a man, he gits perfane, an' ef hits a woman she gits so cantankerous 'tain't no use to pint out the beauties of nater to her. She wouldn't see the gates of Paradise ef they was swung right acrost the road. I allers knows what's the matter. They air jest hongry an' beat out with the long ride. Bet the explanation don't do 'em no good. So I hev larnt to save my best tale to tell long here to keep ther stumicks from growlin'."

This was a hint the passenger was not slow to take.

"Let's have it, Uncle Jimmie, I am as empty as a drum."

"I reckon hit was arfter yo' was here last year 'at I had the rucous with the X-ray doctor," he began, tentatively.

"Must have been. I didn't know you had such a man in the valley."

"We hain't. We don't need nothin' here bet a medwife an' the old catnip doctor fer the wimmens an' babies. Bet I had ter ketch a disease them two knowed nothin' erbout. 'Twan't much, jest a little white spot up thar on my jaw bone, same as ef I'd begun to fade in one place. An' I never werried none until one day I was over ter Blue Ridge an' I seen a nigger with them little white spots all over him. He was the worst lookin' sight you ever laid yore eyes on. Somebody 'lowed he had the Luker-dammer (leucoderma). An' then I got skeert, fer I didn't want hit norated here in the valley 'at I had sech a blasphemous soundin' thing on me as Luker-dammer. Hit 'ould ruin my business, an' I didn't know bet I mout git turned outen the church besides. Our preacher is powerful strict. He suspended a man onct fer

havin' the eetch; 'lowed he couldn't set with the congregation ontel he was kowed. The pore feller was so mortified he backslid an' finally died in his sins.

"Bet our doctor couldn't do me no good, an' he 'lowed I had better go up to Atlanta an' consult the X-ray man thar. He had some sort of lightenin' merchine fer takin' off cancers, bonefelons, warts, an' had even drawed a bug outen a little gal's year with hit. Well, sir, I didn't altogether like that I heerd, fer ef the blame thing was that powerful, I didn't know bet hit mout take my head off, or strike me somewhar in the flanks when I wa'n't lookin'. Still, I lit out fust chanst ter Atlanta ter see ef he could git that little cussin' spot offen my jaw. An' ef I ever seen a cunjerer that man was one. He mighty nigh got my gall bladder afore I had sense enough to git outen thar!"

Uncle Jimmie's eyes were wide now with the memory of his startling experience. His chin-whiskers wagged excitedly like a goat's beard as he chewed his quid with ever-increasing emotion.

"His office was in one of them tall buildin's on the Viaduct, an' thar was a fine settin'-room to hit whar the patients waited. Hit was plum full of folks, too, the day I was thar; but I took a cheer off to myself. Torectly, 'nother man come in an' set down by me.

"Don't git too clost, mister, I got the Luker-dammer, an' I don't know yit whether hit's ketchin' or not," sez I."

"Godlemighty! you never seen such a rucous as thar was next minit. Them folks fell over one 'nother gittin' out. One little chaney-doll woman hanged her coat-tail on my cheer leg as she runned by, an' when I tried to help her git loose, she screamed an' spit at me like a wild-cat. I was left by myself, bet I 'lowed 'at the thing I had must be a terrible disease fum the way the folks skedaddled.

"The doctor got wind of the row, an' I seen him open the door of his office a little way. Gosh! When he poked his head in the sweat popped out on my back. He didn't have no natchel color. His face was as white an' hard as a rock wall. He looked at the empty cheers, an' then his eyes lit on me.

"What's the matter with you?" he sez.

"'I got the Luker-dammer,' bet before I could finish he drawed back, shet the door quick an' yelled through the keyhole: 'What the devil is that?'"

"'I don't know; 'lowed mebbe yo' could tell me,' sez I.

"'I'll be out in a minit,' he sez, an' all the time I could hear his infernal merchine a-whizzin' an' a-spittin' in thar whar he was. Presently the door opened ag'in, an' in stepped somethin' that looked like the picters yo' seen of divers. He had a mask on his face, gloves on his hands, an' white night-drawers on every whar else.

"'Be still,' he sez, fer I was aidgin' to'ard the door, 'I wear these things to keep out contagion. Now what air yore symptons?' draggin' his cheer up an' settin' down.

"'Thar hit is,' sez I, pintin' to the white spot. He c'reemed his head for'ards like a terrepin an' looked at hit.

"'Is this all thar is the matter with yo'?"

"'Gosh a'mighty! Hain't hit enough,' sez I.

"'Tain't nothin' much!"

"'Nor ketchin'?' fer that had pested me mor'n anything.

"'No!' sez he, a-jerkin' off his gloves an' medicine breeches.

"'The pint is, kin yo' take the blame thing off?' sez I.

"'Oh, yes! Step this way.'

"'We went in thar where the gol dern thing was a-turnin' an' a-spittin', an' he set me down in front of a little glass, bilin' full of clear yaller stuff.

"'The room was dark, an' I felt creepy like I was bein' conjured. Bet I gripped my cheer hard so as to be ready when he turned on the ray. Fur I 'lowed hit 'ould come like a streak of lightenin'. When I had been keyed up that way a right smart while, an' nothin' happened, I 'lowed.

"'Doctor, I am ready.'

"'Ready fer what?'"

"'Yo' kin turn on the ray,' sez I.

"'Don't you know yo've been lookin' at hit ten minits?'"

"'Yo' don't call this little bowl of lemonsade the ray, do you?'"

"'That's hit,' sez he.

"'Thar hain't 'nough light in hit ter draw a candle fly.'

"'I kin see the bones in yore neck,' sez he.

"'An' show 'nough he was settin' thar in the dark behind me with a shade over his eyes. I riz up, an' I sez:

"'Look'e here, mister, I hain't never seen them bones myself, an' no man is agwine ter pry arfter my skeleton 'till I git through with hit,' fer I was mad.

"'Yo' may see mine,' he sez, handin' me the shade an' steppin' in front of the merchine.

"'Well, sir, I be blamed ef I didn't see his naked grinnin' skull. I knowed then hit was magic, an' I was that skeert my knees popped together, which was a kind of meracle, me being bowlegged. I made out to snatch the door open an' run. Hit was four hours tell the Blue Ridge accommodation pulled out, bet I found a little closet down thar at the depot an' I set in hit tell time to go home."

There was a moment's silence during which the passenger wiped the tears from his eyes, and made a determined effort to control his laughter.

"'But what became of the spot, Uncle Jimmie?" he asked.

"'That was the quarest part of the whole performance. Mebbe a week arfter I come home I looked in the glass one mornin' an' the dern thing was gone.

"'I sent the conjurer a quarter, fer I didn't want him ter think I skipped ter keep from paying my bill. Bet if hit was to save me from bein' an' out an' out albiner, I wouldn't let him have another shine at me. The Bible's ag'in sech doin's.

"'We air gittin' nigh enough home now to smell the coffee a-bilin'. An' there's Jabe Teasley's dorg settin' yonder waitin' ter bark us by. He hain't failed durin' the five years Jabe's had him ter threaten every man, woman an' child that passes along this road, an' no more fight in him than thar is in a nanny-goat."

NASHVILLE, TENN.

The Latest Methods of Dealing with Consumption

BY LAWRENCE F. FLICK, M.D.

[Dr. Flick has not only made an exhaustive investigation of tuberculosis but has been prominent in modern methods for treating it, through his connection with the Pennsylvania Society for the Prevention of Tuberculosis, of which he has been President. Dr. Flick is the author of a number of works upon the subject, which are well known to physicians throughout the country. Largely through his efforts the sanatorium at White Haven, which is described in the accompanying article, was opened, and it is an interesting fact that Mr. Henry Phipps, the philanthropist, who has provided the means for an Institute for the study and treatment of the disease, obtained his inspiration from observation of the results which have been accomplished at White Haven. Another institution which is also illustrated is the Sharon Sanatorium, located at Sharon, Mass., where the results have been equally important. The attendance at Sharon, however, is limited to women. As the photographs show, the patients aid nature as much as possible in endeavoring to effect a cure.—EDITOR.]

IT is not surprising that the employment of the elements of Nature, such as pure air and sunshine, should be beneficial in the treatment of pulmonary diseases, but perhaps only in recent years has their importance been fully appreciated. In former years patients suffering from a variety of diseases were believed to be at least aided by proper ventilation of the sick chamber, if not by the sun's rays. It has been recognized, however, and especially by physicians who have devoted their attention to a careful study of the disease, that tuberculosis can be cured by what is popularly termed the "open air treatment," provided it has not reached a stage which is too far advanced. I believe I am justified in making this assertion by the results which have thus far been obtained in institutions especially constructed and equipped to aid nature in her work of restoring health. Some of the sanatoriums of this class, intended especially to receive sufferers from pulmonary complaints, have been in existence

long enough to prove that the method is no longer an experiment, and the man or woman who takes advantage of it before the system is too seriously affected has far more a fighting chance for complete recovery.

Perhaps an outline of what has been accomplished at the White Haven Sanatorium may be of interest in this connection. When White Haven was opened on the Pennsylvania hillside the buildings consisted of a tumble-down old barn and a very dilapidated small farmhouse located on a tract of two hundred and fifteen acres of mountain land. The Free Hospital for Poor Consumptives, which established it, had no money on hand with which to begin a well-equipped sanatorium, and there was no prospect of getting any in the near future; so it was decided to begin in the humblest way and depend upon Providence for the financial resources as the work would develop. A few comfortable single beds of ordinary hospital pattern and make-up were put

on the barn floor for the patients; a little room in the farmhouse was plainly furnished for the superintendent, and another for the cook; a small kitchen range was secured and placed in a very primitive kitchen; a table and a few benches were made out of old boards for dining-room furniture, and a few dollars were expended for kitchen and dining-room utensils. This was practically the entire equipment and the cost was but a trifle.

When the Board of Managers talked over the matter of opening the sanatorium it was thought that under no circumstances could the capacity of the institution be increased beyond twenty-five beds during the first year. It was soon found, however, that this limitation could not be adhered to. The most urgent appeals came from everywhere, and as it was possible to pay the bills at the end of each month, a few beds were added from time to time. At the end of the first fiscal year there was a capacity of eighty beds, but in spite of this increase there was a waiting list of over one hundred patients, and the pressure for ad-

mission was greater than it had been at any time. During the first year there were one hundred and fifty-six admissions. Of these, sixteen remained less than a week, and eighteen more less than a month, making a total of thirty-four who remained less than a month. Some left because the place was too primitive, some because the weather was too cold or because they were afraid to sleep in a draft, some because the associations were not good enough, and a few had to be discharged for breach of discipline. The results which were obtained, however, during the first year were far beyond expectation. A majority of the patients who remained over three months either recovered their health sufficiently to return to their avocations or are making rapid progress toward that condition. Quite a large percentage of the patients left as soon as they were well enough to go to work, promising to keep up their treatment at home. Some of these have done well, and it is quite possible that, with the knowledge they have gained at the sanatorium and the habits of life

General View of Sharon Sanatorium Buildings

which they have formed, they will progress to recovery while pursuing their callings. In age the patients ranged between nine and sixty years. The majority were of the age of greatest activity and usefulness in life—namely, between twenty and fifty years.

The treatment at the White Haven Sanatorium has been out-of-door life, a carefully selected diet, regulation of exercise and medication for the improvement of nutrition. The patients prac-

camps amid the trees are near enough to the buildings to allow the latter to be easily reached when the dinner hour comes around. In them congenial groups pass most of the day in chatting, reading or games; the women often busying themselves with needlework of some sort. Each camp represents a little social club, where it is easy to forget one's ills amid the cheerful surroundings. Very simple structures are they. Any material available is used for the roofs and walls.

The Open Air Dining Room at the First Hospital Building

tically are kept in the open air for the twenty-four hours, irrespective of weather. At night all the windows in the pavilion are kept open, so that the air circulates freely throughout the sleeping apartments. Drafts are disregarded. Ample bed-covering is supplied to keep the body warm, and in cold weather bed-warmers are furnished the patients. In day time the patients either sit out of doors or work. The camp life is one of the unique features, but thoroughly enjoyed by the patients. The summer

Planks or boughs fastened to convenient forest trees may form the sides, the trees being used for posts. Usually the southern side is left open, for they are merely intended as shelters in inclement weather, so that the inmates are to all intents and purposes in the open air. If warmth is required to make the camp comfortable, a small wood stove or perhaps an open fireplace is provided. During the winter months it must not be supposed that the camps are deserted, nor is outdoor recreation abandoned. Patients whose con-

dition will allow them to go into the woods spend much of the time in these shelters, wearing sufficient clothing and wraps to prevent becoming chilled. The exposed side of the hut is not closed in winter, and it is often necessary to make a path through the snow to reach them.

While the camps, as already stated, are very popular during the period between May and December, a large number of

Women Patients Exercising in the Morning at the Sharon Sanatorium

where they may receive not only the benefit of nature but enjoy the society of friends.

Each patient is required to take no less than three quarts of milk a day and no less than six raw eggs a day, and is advised to take as much more of this kind of food as he can. In addition to this food he is given a good dinner in the

middle of the day and a very light breakfast and supper. The dinner consists of

Patients Cooking a Meal in a Winter Camp at White Haven

Log House Retreat

those who are members of the community live under canvas, for tents are put up about the permanent buildings and inhabited until the snow comes. As to the "winter" camps, not a few have been constructed by patients with such tools as were available. They have used not only axes and saws, but even their penknives, and have gladly performed the labor in order to secure these resorts,

roast beef or beef-steak, vegetables, some light dessert, such as pudding, custard,

ice-cream and fruit.

The breakfast consists of some cereal and, in cold weather, hot milk or coffee. The supper consists of boiled rice and fruit, cheese, milk and eggs. When patients contract colds, as they occasionally do when some one comes into the sanatorium with a cold, they are at once put to bed and kept there

Open Air Sheds for Women Patients at White Haven

Patients Playing Golf

until they are over the acute stage. Colds always come in epidemics, passing through the entire sanatorium. As a precautionary measure the sanatorium has printed notices at the entrances to the grounds requesting people with colds to remain off the premises. The pulse and temperature of each patient is taken and recorded night and morning, and the weight is taken and recorded once a week. These records give an indication for the regulation of diet and exercise, and are carefully studied for that purpose. Patients who have rise of temperature and disturbed pulse-rate are not permitted to take any exercise. Unless a patient gains weight, his diet is incorrect and an effort is made to correct it.

The sanatorium was opened ostensibly for incipient cases. It was impossible, however, to limit admissions to this class; first, because not enough of such cases could be secured, and second, because the pressure for the admission of

other cases was too great to be withstood. Advanced cases were cautiously admitted, and upon it being found that they did well, the doors were thrown open to all subjects who did not show a rapid downward tendency. Of one hundred and fifty-six admissions in one year, there were only fifteen who might be termed incipient cases. Sixty-three had both lungs involved, and about ten per cent. of the entire number had at least one other organ or tissue involved beside the lung.

A study of these and other patients, however, taught some valuable lessons. (1) That tuberculosis is curable under the most primitive conditions, provided the patient is kept out of doors and given plenty of the right kind of food. The comforts of life are of secondary consideration, and exposure to weather and cold may be disregarded. (2) That for successful sanatorium work patients should be carefully classified and kept

apart according to the stage of the disease. (3) That tuberculosis is seldom recognized until it is far advanced, and that many patients continue to work when they have more than one important

organ of the body involved. (4) That incipient cases recover in a very short time, and advanced cases require a long time for complete recovery.

Types of Patients at White Haven

The Problems of Irrigation*

BY JAMES WILSON

UNITED STATES SECRETARY OF AGRICULTURE

THE dominant note of the Eleventh National Irrigation Congress, held at Ogden in September, was jubilation—hearty self-congratulation upon what had been accomplished in furthering the cause of progress in arid America. There is, indeed, a good deal of excuse to be made for this state of mind, for much has really been done to further the establishment of more homes on reclaimed land.

I trust I shall not be accused of ultra-conservatism if I now sound a note in a somewhat lower key. I am a believer in the indomitable energy of Western men, and no one is readier than I to admire what Western initiative and resourcefulness have wrought in reclaiming the desert, qualified, as my admiration is, by regret at the deplorable waste of money in injudicious enterprises. But there is a world of hard and complicated work to be done before we can say that irrigation is established on a sound, safe and enduring basis.

Before discussing some of the problems signified it may be interesting to look

back for a moment to the very beginnings of irrigation in the United States. Centuries before the formation of the Republic there were ancient civilizations in the far Southwest, with well established practices in irrigation; and to this day traces of their ditches and canals are to be seen, tho the civilizations dependent upon them have vanished. At Las Cruces, New Mexico, are ditches with an unbroken record of three hundred years of service, and in the Salt River Valley of Arizona and elsewhere are well defined remains of ancient irrigation works.

But for the beginnings of irrigation in the United States we must look to the work of those wonderful emigrants, the Mormons. When these people settled in the Salt Lake Valley of Utah, in 1849, they were on the verge of starvation, and for them it was irrigate or perish. The isolation of these pioneers, compelling them to be self-sustaining, has had an important influence on the subsequent prosperity of Utah, for the necessity of producing everything for themselves led to the practice of a diversified agriculture, and thus they escaped the vicissitudes that too frequently come upon a

* From an interview prepared for THE INDEPENDENT.

"one-crop" country. Their environment was harsh, but they adapted themselves to it with wonderful success.

Within a few years after the establishment of the Department of Agriculture as an independent bureau (1862), occasional references to irrigation began to appear in the reports of the Commissioners of Agriculture. As early as 1867, in the report of Commissioner Capron, Charles D. Poston, of Arizona, wrote interestingly upon the subject, describing briefly the progress of irrigation in Arizona, Texas, Utah, California, Mexico and South America, concluding with some remarks on irrigation in Italy, Spain, Egypt and China.

In the report for 1874 of Commissioner Watts, there is a discussion of irrigation in California, based upon the report of a commission appointed under an act of Congress, approved March 3, 1873, for an examination of the San Joaquin, Tulare and Sacramento valleys of California. This commission appears to have laid down the principle, now the subject of much discussion in irrigation circles, that the land and the water should be inseparably united.

To the same (1874) report George P. Marsh, the distinguished author of "Man and Nature," contributed an elaborate and interesting (if somewhat quaint) article, entitled "Irrigation: Its Evils, the Remedies, and the Compensations." Mr. Marsh foresaw many direful evils as likely to flow from the general practice of irrigation. Injury to the respiratory systems of the irrigators, he thought, would come from the increased dampness of the atmosphere and the exhalations from the watered soil and moistened

manures; and the same influences would tend powerfully to favor the development of malarious influences and to aggravate, if not occasion, febrile diseases. Where large reservoirs have to be constructed, he says, "it is found in practice almost an impossibility so to secure the retaining dams or walls that they do not at length burst their barriers and overwhelm the country below with ruinous desolation."

This is a gloomy outlook, but it is lightened a little further along in Mr.

Marsh's article by a delicious bit of humor—whether conscious or unconscious I shall not undertake to say. He says:

"There is another suggestion which it is proper to make in estimating the economical value of irrigation—namely, the fact that in some parts of our country production is now overabundant—that it needs rather to be repressed than enlarged. When the market price of Indian corn is less than the cost of its transportation to the seaboard, and growers can turn it to no better account than to burn half of it for fuel for distilling the rest, it is

evident that the money it costs to raise the surplus yield might be more advantageously spent in creating new facilities for conveying the grain to consumers who require it for higher uses than in making expensive arrangements for increasing crops which are already so luxuriant as to be a burden rather than a blessing."

And in a footnote to this he adds:

"Hair powder, which in the last century was essential to full dress, is again coming into vogue, and the omnipotence of Parisian fashion may restore to starch its ancient dignity and importance. Hence a revolution in the costume of our 'upper ten' may, perhaps, relieve in some slight degree the bursting granaries of our Western corn growers by applying their contents to new or rather enlarged uses."

JAMES WILSON

Probably we shall be safe in neglecting, until the fashion changes, the influence of hair powder upon irrigation, and may turn to more modern history. In 1891 we find Secretary Rusk reporting upon the work done under an appropriation of \$70,000 in all, made by the Fifty-first Congress, for investigations into artesian and underflow waters, the sources thereof, and their availability for irrigation within the region known as the Great Plains, and for "an inquiry into the best methods of cultivating the soil by irrigation." The work was done with care and thoroughness, and the final report, General Rusk thought, would be ready by January, 1892.

The office charged with the irrigation investigations of the Department of Agriculture was organized on substantially its present basis in 1897. For the fiscal year 1903-4 Congress has allowed \$65,000

"to enable the Secretary of Agriculture to investigate and report upon the laws as affecting irrigation and the rights of riparian proprietors and institutions relating to irrigation, and upon the use of irrigation waters, at home and abroad, with especial suggestions of better methods for the utilization of irrigation waters in agriculture than those in common use, and upon plans for the removal of seepage and surplus waters by drainage, and upon the use of different kinds of power for irrigation and other agricultural purposes."

The usual authority for the preparation of reports is given.

I may remark, parenthetically, at this point, that Mr. Marsh, in his article above referred to, sets forth his views as to the lines of investigation that ought to be followed by the Government, and, with the exception of the study of seepage waters (a question at that time of less importance), he enumerates practically all the topics for investigation embraced in the Act of Congress from which I have quoted. In fact, his whole discussion of this phase of the subject is eminently sound and sensible.

The irrigation investigation of the Department of Agriculture is now conducted, under the Secretary, by Mr. Elwood Mead, an irrigation engineer of note, Dr. A. C. True, of the Office of Experiment Stations, exercising general supervision over the work. The more

the question of irrigation in general is studied the more complex it appears. There is, to begin with, a regrettable lack of accurate statistics on the subject. There is no adequate system of recording the number of irrigations in most of the States practicing irrigation, and Mr. Mead has said that there may be 75,000 completed ditches, or there may be twice that number. Obviously, if the number of ditches is unknown, the number of acres under irrigation can be only guessed at. The field for investigation, however, is certainly a vast one, including the Territories of Arizona and New Mexico, the States of Colorado, Utah, Nevada, Montana and Wyoming, and large parts of California, Oregon, Washington, Idaho, North Dakota, South Dakota, Nebraska, Kansas and Texas.

In much of this region irrigation is a necessity, and the greater part of the time of the Department's force has been properly devoted to the study of its problems. The humid East, however, has not been wholly neglected, some very interesting experiments, in co-operation with State Experiment Stations, having been made in New Jersey, in Wisconsin and in Missouri, with results of great value as showing the immense benefits to be derived from the application of water at the right time to strawberries, asparagus and other garden crops.

The problems involved in the use of water in irrigation fall naturally into two great groups. In the first are included the legal questions arising from the great diversity of State laws and local customs, in the second the practical questions involved in the actual application of the water to crops. Of the first group it is sufficient to say that our experts have made a comprehensive study of the whole subject, including not only the laws of the States, but of Canada, Australia, Europe and Egypt as well. The function of the Department, it is hardly necessary to say, is not to suggest the enactment of laws, but only to furnish data upon which legislators may base their measures. It would be a benefit if something like uniformity in legislation could be reached, and the development of irrigation as time goes on may possibly force some form of concerted action upon the Legislatures of the States.

The problems involved in the economical application of water to crops are many and important, not only in themselves but in their relation to the legal aspects of the subject. The determination of the quantities of water used and of the losses from canals are obviously of great importance in settling rights to water, which have often been established without due regard to the volume of the stream, the capacity of the canals, or the needs of the land to be irrigated.

The people of the United States are characteristically wasteful of natural resources. We have almost exterminated several species of our game birds, and now are striving, by the enactment of game laws and the establishment of Audubon societies, to save those that remain. We have hewed our way through the forests from the Atlantic to the Pacific, and now, through the labors of the Bureau of Forestry and the establishment of forest reserves, are hoping to teach conservative lumbering and save the trees that remain. In irrigation, the measurements made by our investigators show that some farmers use from five to ten times as much water as others, who secure equally good results with the same crops under similar conditions. It is believed that on an average farmers use at least twice as much water as is necessary. Obviously, if the adoption of better methods results in the saving of this waste, the area of reclaimed land can be doubled. Here, again, the function of the Department is only advisory; it has no power to enforce economy in water using; but if it can demonstrate the advantage of charging for water on the basis of the quantity used, self-interest will probably lead to greater carefulness in applying it.

This points to one of the most interesting and important of the Department's investigations. It is not enough to show that irrigators are wasteful in the use of water. It is necessary to know, if possible, the minimum quantity of water that should be applied to different crops under different conditions, in order to reach the best results. Experiments are under way to demonstrate the facts in this direction. For example, similar fields are being irrigated with different quantities of water in order to ascertain what amount gives

the best result; and in spite of wide variation of conditions, it is believed that an approximation sufficiently close for practical purposes can be arrived at, thus enabling a great saving in water to be made. It follows that from this saving the area irrigated can be considerably widened.

It is generally held that, on an average, canals lose one-third of the water diverted, and this estimate is probably below rather than above the fact. Experiments are being made to find some way of stopping this loss that will not involve a prohibitive expense. Various methods of lining canals are being tried, and it is hoped that some practicable and easy way of checking this great loss will be found. Beside the direct saving that is sought for in these two directions, there is another benefit to be derived from checking leakage. The water now running to waste is not only useless for irrigation purposes, but by causing swamps to appear it involves damage of another kind. If the Department can succeed in working out practicable plans for saving the water now leaking from canals and that which is wastefully used, an extension amounting to a trebling of the area under irrigation will be possible.

Too lavish use of water has, as I said above, caused swamps to appear in many parts of the arid region, and the evaporation of the water in these swamps has brought the alkali of the soil to the surface in such quantity that vegetation is killed. It is estimated that as much as 600,000 acres of land now under irrigation in the West are lying idle because of the presence of alkali. Two lines of investigation are carried on looking to a remedy for this state of affairs; one, in the direction of drainage work to carry off the surplus water, the other in the selection and breeding of alkali-resistant plants. Alfalfa from Turkestan and Algeria, cotton from Egypt, and promising varieties of wheat and barley from various countries of the old world, are being distributed and tested. By selection and breeding the alkali-resistant qualities of these plants will be strengthened, and it is hoped in a few years to have strains that will very greatly increase the possibilities of cultivation under alkali conditions.

I have not space enough to speak of the interesting form of irrigation to be seen in the rice lands of Louisiana and Texas, nor of the remarkable results achieved by systematic irrigation in the sandy regions of Wisconsin. This latter experiment, tho not yet concluded, seems to point to irrigation as a probable means of reclaiming large areas of barren, sandy land in Wisconsin, Minnesota and Michigan.

The most exaggerated ideas of the possibilities of irrigation in the West have been entertained and expressed, but the most enthusiastic advocates of the practice will have to admit that, regard being had to the available sources of water, only a comparatively small part of the arid lands of the West can be brought under cultivation. And yet, after all allowances are made, the possibilities of irrigation are magnificent, and fire the imagination of the dullest. The country tributary to but three streams (three *great* streams, it is true)—the Missouri,

the Columbia and the Colorado—will, when reclaimed, furnish land for millions of homes. The largest yields per acre have been produced on irrigated land. Egypt, says Mr. Mead, with but 6,000,000 acres of land along the Nile, all irrigated, pays the interest on a national debt half as large as our own. The Missouri and its tributaries, he estimates, can be made to irrigate three times the land now cultivated along the Nile.

These and similar considerations justify in large measure the imperial dreams of those whose imaginations body forth the future of arid America when all the available water is utilized. I would but point out that a high order of ability and great patience will be needed to solve the legal and sociological questions involved, and science must point the way if wise solutions are to be reached. It is not to be doubted that the American people, through their chosen representatives in legislation and science, will prove equal to the task.

WASHINGTON, D. C.

Music, Art and the Drama

The Opera

When Mr. Heinrich Conried took possession of the Metropolitan Opera House it was assumed that he would be less devoted than his predecessor was to the star system, and would exhibit wonders of stage management and scenic display. The fact that some of the most popular singers—Nordica, Eames, Schumann-Heink, and the De Reszke brothers—were not on his list was deplored by many, who doubted his ability to find substitutes for them. Nor, in fact, has he been able to replace the two American sopranos; but it may be said that the two American altos he has brought over from Munich and Vienna, Miss Fremstad and Miss Edith Walker, are an equivalent for the loss of Mme. Schumann-Heink. Mr. Plançon is back and takes the place of Edouard de Reszke, while Mr. Caruso, tho not as great an artist as Jean de Reszke, was accepted at once as the best singer of the Italian type now on the stage. With

Sembrich, Ternina and Calvé among his sopranos, and half a dozen other world-famed artists, Mr. Conried is quite as capable of presenting "all-star" casts as Mr. Grau was. In the repertory of the first two weeks the Italians predominated, the operas selected having been "Rigoletto," "La Bohème," "Aïda," "Tosca," as against the German "Wälsch" and "Tannhäuser." All these performances were among the very best ever given in this city, especially as far as the singers and conductors, Mr. Vigna and Mr. Mottl, are concerned. Oddly enough, there has been some disappointment in regard to the *mise-en-scène*. It is acknowledged to be the best we have had, but more still was expected. There is, however, good reason to believe that this "more" will be forthcoming as soon as the machinery, which was barely completed in time, is in working order. The whole stage has been rebuilt, and there has not been sufficient time for rehears-

ing. Unlike his predecessor, Mr. Conried is himself an actor, and especially competent as a stage manager. In "Aïda" he took a hand in the stage setting, and was rewarded by an enthusiastic curtain call. There is every reason to believe that "Parsifal" and the "Nibelung's Ring" will be presented with a scenic splendor equaling that of Bayreuth. The French composers are likely to be the only sufferers this year, as there is no French tenor in the company. "Faust," however, and "Carmen," with Mme. Calvé, will not be likely to suffer neglect in any case.

Patti On November 27th the Baroness Cedarström sang the most recent of her ultimate farewells to New York. Patti is still more than a name. And al-

ADELINA PATTI
At the Hight of Her Fame

ADELINA PATTI
At the Age of Twenty

tho the most renowned of living singers has passed the mark of three score years, her work remains worthy of serious mention. In volume and range her voice has lost sadly, but still in the unforced middle register it is tenderly pure and charged with much of its old-time magic. Tho richness of tone is gone, Patti has preserved a more indispensable possession, an accuracy of intonation which would put to the blush most of our younger vocalists. But here praise must halt. For the conversion of the immediate jewel of an artist's soul into cash is one of the most pitiable of spectacles. If the aged Patti would only be content to warble softly in her middle register! If the ancient Joachim would but keep to his teaching and his composing! But no—these names are too potent at the box-office, and we behold the shrunken apparition of senility, capering in the tatters of its former greatness. And indeed, tho Patti surpasses her German contemporary in respect to intonation, she falls behind him in excellence of interpretation, which is the one thing that may redeem the performances of a broken down musician. In the noonday

of her art, glory of tone and magnetism of presence gilded and quickened those dramatic artifices that now loom up grotesquely potent and bleakly artificial in the afterglow of her powers. Despite all that can be said, however, her voice is still incomparable, and we do not think it will be distasteful to those of the new generation who have never heard her before. Patti projects an American tour of ten weeks, giving 27 concerts in 20 States. She is unsteadily supported by a mixed concert company.

The New York Philharmonic

This moribund orchestra has been—as it seems—galvanized into life by the

radical and ingenious expedient of securing one of the world's representative conductors for each of the season's concerts. On November 13th Edouard Colonne, of Paris, inaugurated the series with astonishing success by his masterly rendering of a program drawn from Bizet, Bach, Lalo and Berlioz. Never has the literary adage "style is the man" been more forcibly demonstrated in a sister art than on this occasion. The new man dominated the old orchestra; he worked a miracle, changing the stagnant water of other days into a sparkling and fragrant vintage. The largest audience of recent seasons tendered the great Frenchman an ovation which he had the grace to turn in a note to Richard Arnold, the concertmeister:

"Vigor, harmony, expression," wrote M. Colonne, "these are the qualities of which your marvelous orchestra gave proof yesterday afternoon. And when I think that such splendid results were obtained in a few hours of rehearsal, I must confess that it is due not only to the merit of the players, but also to the sympathy with which they have honored me."

The series is continued under Kogel, of Frankfort; Wood, of London; Herbert, of Pittsburgh; Weingärtner, of Munich; Safonoff, of Moscow, and Richard Strauss, of Berlin.

The Loan Exhibition of Portraits

that, as a rule, we take greater pleasure in an object represented in art than we do in the object itself, is shaken a little

The conviction reached in a general survey of art

at such an exhibition as that held in New York from November 18th to December 3d, for the benefit of the Othopædic Hospital. Our delight in the appearance of our contemporaries as we see them daily is certainly greater than that which most of our modern painters are able to convey to us through portraits of them. One reason for this must have something to do with the fact that too many of the painters sacrifice a genuine way of looking at things to the sitters' ideas of themselves as in the fashion or in some assumed character, so that we are not able to discover the painter's sensitiveness to them as seen with any strong feeling. The Old Masters more readily give us of their best, because, perhaps, of their finality. They do not represent characters in the making before our eyes, or with which we of the present have, strictly speaking, anything to do; while portraits of our contemporaries raise questions of personal admiration or disapproval. It matters nothing to us now whether wigs or iron bodices were worn in the seventeenth century, except as they help or hinder among the things the artists of the time had to work with; but somehow we are apt to be annoyed in a portrait by the crease in a modern man's trousers or by the sleeves too large or too small, and the fussy chiffon bows on the back of the neck. The exhibition, as a whole, however, gave one a far greater feeling of satisfaction with contemporary art than the several annual exhibitions are able to do, even tho the method of collecting pictures for a charity-show left out many works that would have made a more complete impression of modern art possible, and included many which exhibit the trying truth that a part of the portrait-ordering public does not deserve the best artists available. The modern foreigners whose works were shown in few cases justified their popularity, but even the weakest among them were infinitely superior to some of our own undeservedly successful men. It cannot but be a matter of wonder that such a portrait as that by Munzig of a lady holding a paper doll, which the catalog called her son, could be hung in any house, and the portraits by Richard Hall are nothing more than mere records of existence with painfully painted accessories. Carolus-Duran

already seems to challenge comparison with men of a recent past and to lose by it in some ways, tho still remaining the best of the Frenchmen and a great stylist. The English painters were poorly represented, tho the wearisome portrait of a young girl by Millais had its use in proving the worth of some of our men as painters of childhood—Sargent, Alexander, Caecilia Beaux, Chase, even, in spite of a sweetish quality. No foreign modern represented in the show could paint anything as individually interesting as Alexander's portrait of Mrs. Hastings, and a thing that, besides seizing a phase of the personality so happily, will also hang on a wall in a good room so well. The one thing all ages must demand of an artist—that he go his own way in spite of everything and give us the sum of *his* impressions of life, not ours, or some other period's—is supplied in the work of this very individual painter, and in very different ways in the works of Zorn and Whistler, and the greatest representative painter of the time—Sargent. Miss Beaux's pictures do not show at their best in an exhibition great in numbers and varieties of impression. Indeed, the portrait at its best is a work that is only thoroughly enjoyed in its own home. For the intimate pleasure in the delectable things in such work as Miss Beaux's or Wilton Lockwood's (and, by the way, what a pity that Lockwood was not represented in the show) it is necessary to see them where all sorts of warring influences are not at work. And the things loaned from homes of questionable taste are made cruelly to show their commonness when they enter the society of their superiors. It is the last thing demanded of a portrait painter that his work be fitted to any surroundings, yet a few of our men would hang well in any *good* interior, whether furnished in Mission style or Louis Quinze. Whistler always, Alexander nearly always, Robert Henri often. Sargent needs splendor or else extreme bareness, while Caecilia Beaux requires the suppression of strong colors around her works. The splendid old masters shown—the Rembrandts, and Vander Helsts, the Velasquez, the Coellos, the beautiful eighteenth century English and French pictures—were a feast

picture lovers in America do not often have set before them; but what the exhibition should really have taught New York is that it is possible to-day in the twentieth century to find faces and figures for a portrait that will be a genuine work of art, if care is exercised in the selection of the painter.

Bookbinding Exhibitions

Among the several book-binding exhibitions held at various places throughout the country during the year there are none more important and interesting than those held annually in this city at Scrib-

A Chained Book. Reproduction of original in the Scribner exhibition of 1903. The binding shown is in the original oaken boards covered with sheepskin, having the original chain attached. The value of this volume is \$500.00.

ner's and at Bonaventure's. At both places it has long been the custom to show the bookbinding achievements of leading foreign and American binders during the year preceding the exhibitions. At Scribner's a departure was made this year from the time honored custom, and in the place of an exhibition of modern

bookbindings a collection of superb examples of famous historical bindings was assembled. So large a number of choice books, bound by masters whose names figure in all the books on bookbinding, has never before been exhibited in this country. Possibly the *pièce de résistance* of the display was a chained book. When the first books were printed it was needful to chain them to prevent their being stolen, and an iron chain was fastened to the heavy wooden sides with which the book was bound. Some very choice examples of embroidered bindings of the seventeenth and eighteenth centuries, bindings in silver and silver filagree, in some cases studded with enamels and jewels, kingly psalters and prayer books, and Venetian mosaic bindings, were to be seen in this exhibition. And some invaluable manuscripts from the hands of celebrated calligraphers were also numbered in the Scribner catalog, besides a profusion of books from various royal libraries and collections. This year's exhibition at Scribner's is the finest of its kind yet seen in the United States. At Bonaventure's Galleries, opposite the Waldorf, the strength of the exhibition was, as usual, with the bindings which were mostly executed by modern French binders. Mr. Bonaventure is accustomed to procure his exhibition bindings in person from Paris and to superintend their execution there. Among the American binders represented at the Bonaventure exhibition this year were Ralph Randolph Adams, The Club Bindery, and Stikeman. Some royal and historical bindings were also shown. These included volumes from collections made by Henri II, Cardinal Mazarin, Madame de Pompadour, Madame Du Barry, Napoleon, Josephine and several of the other Bonapartes, Louis XVIII, Charles X, and the Duchesse de Berry. These books were inlaid, blind tooled and exquisitely tooled in gold. Some of them carried "super-libros," as the owners' coats of arms impressed in gold upon the books' sides are called, and others again were marbled under the gilt, while one or two had landscapes painted upon the edges of the leaves. Both the exhibitions to which reference is here made closed last week. The books remaining unsold, however, may still be seen.

The Stage The theaters are in the doldrums. With nearly half of the "season" gone, managers, already counting enormous losses, are confronted with worse conditions than have been known in many years. While for seasons the theaters have enjoyed remarkable prosperity, the public now seems almost to have abandoned them *en masse*. This season, beginning as usual late in August, early showed poor patronage. Matters grew worse and worse, and November developed the most depressing state of affairs that the stage has known in a generation, all things considered. The most notable event of the season, the coming of Sir Henry Irving, in its results, perhaps, shows as plainly as anything could the amazing apathy of the public, if it can be called apathy. Perhaps mistrust is the better word to use. On all his former visits to this country Irving planned and profited by long visits in New York—two months or more each time. This year, under the direction of the Theatrical Syndicate, he was assigned to New York for three weeks, and was placed in a theater he never had appeared in before. Here it may be suggested that the apathy or the mistrust of the public that has resulted in theatrical stagnation possibly relates to anything new put forward rather than to offerings of which the public has exact knowledge. The dominating influence in the theater may have so abused the public that the strange condition that prevails might reasonably be attributed to popular resentment, which expresses itself by ignoring most offerings that are new. Irving's experience in New York would seem to indicate that. Before he came it was announced that he would appear in this country this season only in "Dante," a somewhat crude and melodramatic spectacle by Sardou that had but a success of curiosity in London, and was interesting mainly because Irving's aspect and impersonation in the chief part were marvelously in line with the common conception of the subject. But people here refused to patronize even Irving in this play, and yet when he revived several of his time-worn successes he had fine audiences. And this experience would seem to explain the parlous state in which the theater finds itself. Dozens of new plays

have been put forward, but of them the even moderately successful may be counted on the fingers of one hand. The failures have among them developed remarkable facts. But one or two instances need be related. A firm of syndicate managers, ambitious to shine as producers of Shakespeare, at great expense put on "A Midsummer Night's Dream," inducing the popular Nat Goodwin to play "Bottom," and giving the event the exceptional advantage of opening their new theater, the New Amsterdam, a magnificent house. Here, indeed, seemed to be a fine combination. But after the first night the public shunned the offering. Its managers had caused to be introduced into this production much sumptuous embroidery, feminine, electric, and the like, usual in the music shows of their making. It was evident that the lovers of Shakespeare did not like this sort of trimming, and that the lovers of the music show did not like the Shakespearean foundation. It is safe to say that it will be a long day before these managers again essay Shakespeare, and perhaps this is best. But even so popular a playwright as Clyde Fitch has during this depression had a lesson that he should ponder. It is said that not one ticket was sold for the second representation of his new play, "Major Andre," on the day thereof; and the play was quickly withdrawn. Many other new plays

have fared but little better during the season. But all managers have suffered alike, the just as well as the unjust, while some of the latter have made offerings that should have found favor. It is apparent that the public, sick of the inanities and the mediocrities set before it pretentiously, has resolved to be more judicious in theatergoing. This writing finds few things running in New York worth seeing. Maude Adams, in "The Pretty Sister of Jose," draws large audiences. The play itself is of little moment, and does not fit her artistic personality—she is essentially an ingenue, and the dramatic strengths forced upon her in this piece result in mock heroics—but she has such a personal charm and elfin fascination that, as she has been absent from the theater for two years, people will throng to see her everywhere. Gillette, too, draws heavily in "The Admirable Crichton," as plainly for his personality—which has the unusual complement of brains—as for his vehicle. THE INDEPENDENT has already noticed Mr. Stephen Phillips's "Ulysses," a play of real eminence and note. The only others that should be mentioned are "Captain Barrington" and George Ade's "The County Chairman," the former an American historical play and the latter a production of "The Old Homestead" variety, with the scenes laid in the Middle West instead of New England.

A Day on the Farm

BY URBAN LAVERY

[We print the following article just as it was submitted to us by Urban Lavery, who tells us that he is the boy of eighteen years of age mentioned in the text.—EDITOR.]

FATHER came into our room, where we were asleep, carrying a lamp.

He woke us and we started up, looking blinkingly at the light. As soon as we were awake he said: "Boys, the cows are out; come quick before they wander away." Soon we are up and dressed and are going downstairs. As we go down he tells that he has just heard them go past his window, and that if we hurry they will not have time to wander far. So we boys (three of us, ages nineteen, eighteen and fourteen respectively) hurriedly scratch a light and hunt for our boots. This is all done in much less time than it takes to tell it, and it is not more than a few seconds after we are dressed, till we are bursting out of the door into the darkness. Darkness, for as we came out I glanced at the clock and saw the time—1:30. And then this night has been made especially dark by a heavy thunder storm which has just passed over. We have a lantern, and as we go we stop to peer into the darkness for the marauders. We cannot see them, so we pass on, out behind the barn, for they are probably in the meadow out there. Soon we are bursting through the tall, wet grass, up to our waists. We have gone but a few steps before our pants are wet through, but that does not matter, for the cows are destroying the harvest, and then we cannot be much wetter than we are; so we keep on. Soon we come upon a cow feeding on the tall, luxuriant grass. As we come up to her she takes fright and starts to run in the wrong direction. We try to sprint by her, but soon she is up with the rest of the herd, and away they all go as fast as they can run. They are going straight for the field of oats, and they must be turned before they reach it. So we race through the tall grass out of breath, and wet, oh, so wet! But the cows are having hard work, too, and they are slowing up, and presently they are turned and driven toward the barn. There they must

be counted; so we go over them to see if they are all there, but there are only seventeen in the barn. There are six gone, for there are twenty-three in all. The rest must be brought in at all costs, so we go out again. But we have gone but a short distance, when the lantern goes out for lack of oil. We must have a light, so we go back to the house to fill the lantern. In a moment we are back again at the barn. Francis is ahead, and as we round the corner of the barn, he shouts, "Here they are." We turn them in, and as they pass we count them. There are only five—one is still missing. So we go out again for the third time, but we do not have to go far, for there she is, just discernable in the dim light. She is glad to join the others, so we turn her in. After we have latched and barred the gate so that they cannot open it again, we hurry to the house, for we are cold and wet. There, after we have puffed a few minutes, it is proposed to get something to eat. So we commence to hunt. We go down cellar and come upon a cake which was baked the day before. It looks good, so we cut it in three pieces and return to the kitchen. So much cake cannot be eaten without some milk. So Francis goes out to the can after some. Soon we are enjoying the pleasures of a midnight lunch. Oh! how appetizing! One who has never enjoyed such a meal cannot fully imagine the keen enjoyment of it. While we are eating father comes down to see if we got all the cows in. We tell him that we have, and so he goes back and leaves us undisturbed.

Our lunch finished, we are off to bed again, having been up just an hour. Soon we are asleep again, and it seems we have been in bed but a minute or two when father comes in to call us again.

It is half-past four, and the real day's work begins. The sun has not yet risen as we go out. The birds are busy singing. We breathe the sweet air, perfumed with the pure incense of morning. The

storm of the night has passed away, and its remains are scarcely discernible. But the cows must be milked before breakfast, and so we are off for the lot. There are eight apiece for Francis and me, and seven for Paul. This will take us about an hour. The cows are sleepy after their long ramble in the night, and they have to be urged before they will get up. Soon we are busy milking, and we are all done and have the horses fed by six o'clock. Then a good wash in the clear, cold water pumped fresh from the well, and we are ready for breakfast.

The meal consists of fried potatoes, some of Armour's bacon, brown and white bread, wheat and cornmeal pancakes. There is also coffee and buttermilk for those who like it. It is just fresh from the creamery across the way. I have been at school in a large city for the last four years, and I can appreciate good buttermilk, and I feel sure that if the readers of THE INDEPENDENT could get such buttermilk as we have they would appreciate it too. Its pleasant aroma and agreeable taste, when fresh, make it a delicious beverage.

But to pass on; breakfast is over and Father sends us out to mow. Two, with mowing machines and one with a scythe. The latter to mow "fence corners" and patches around the trees which the machine cannot cut. Paul and I harness the horses to the machines while Francis is grinding his scythe. Our cutter bars have been sharpened, so we all start out together. Having arrived at the field, which is about a quarter of a mile from the house, we let down the cutter bars and oil the machines, and then, after throwing the machine in gear, we are ready to begin. We start the horses, and the machines go jiggling merrily through the grass. As the knives jump quickly back and forth the butt of the stalk is jerked suddenly one way and then the other, and then it topples over. It is certainly a sight to make a philosopher ponder to see so many stalks being cut down. One thinks, as he sees so many stalks behind the cutter-bar, of the similarity between the harvesting of hay by man and the harvesting of humanity by the Grim Reaper.

After we have mowed two swaths around the field, one continues going

around while the other mows the back-swath, so that the fence-corners can be cut. This cutting the back-swath is usually the difficult job, for there are so many outhills and woodchuck holes along the fence, and then there is also the danger of catching the point of the bar in the fence. I have known men to break the tongue out of their machine by trying to get too close to the fence. But they were too careless and they touched the fence a little too hard, and a breakdown was the result. After I have gone around the back-swath I follow Paul around on the piece. We have to stop once in a while to clear out the bar. A mouse nest gets on the bar and clogs the machine. After throwing the machine out of gear we remove the obstruction and pass on.

As Paul stops at the corner to oil, I come up to him, and he tells me that there is a yellow jackets' nest on the other side. We know what to expect if they are stirred up. It is bad enough if they sting you, but it is far worse if they alight on the horses, for they would run away, and that is not a desirable accident. When we have come around to the place we stop and go ahead to explore. We find the nest—a paper ball about as large as a person's head—hanging on a brier, which stands just in the edge of the uncut grass. There is a solitary bee crawling around on the outside, I suppose as a sort of a guardsman. But we know very well that the inside is full of them. We wait a moment, and this lone scout goes inside, I suppose to report that "All's well." As he disappears Paul hastily pulls out his knife and, catching the brier in his left hand, he hurriedly cuts it off and gives it a throw far out into the cut grass. It is all done so quickly that no bee has time to get out, but as it goes through the air several manage to scramble out and go buzzing madly through the air. They are too mad to see anything save their nest, and they buzz fiercely around it in search of an enemy. We hastily mount our machines and pass on, and by the time we are come around again they have all alighted on their nest and are crawling about trying to fathom the mystery. We leave them undisturbed and continue on our work. As we go up one side of the field a young

woodchuck runs clumsily out of the grass over the mown hay and into his hole in the fence corner. He has so much of a start that we cannot catch him, so we pass on. Tho, if we could have caught him, we would probably have used his hide (as Thompson Seton says) "to generate horse-power."

It is getting pretty hot by this time, and the jug of water, which we have in the fence corner in the shade, is pretty warm, tho I suppose it is still "as wet as any." We make a few more rounds and then stop to oil up. As we are doing so we catch the sound of the dinner bell, telling us to come to the house. We unhitch the horses and start for the house, for we are all hungry—horses and men. We water and feed the horses before we eat our own dinner. Another refreshing wash in the cold water, and we are ready to eat. At dinner we dine mostly on boiled potatoes, large and mealy, and roast beef. There are other things to eat, but these appeal strongest to a hungry boy. After eating we go out and lie under the shade of the maple trees, to let our dinner settle. An hour is given for dinner, and at one o'clock we have started for the field again. We have been going around twenty acres and the piece seems nearly as large as in the morning, tho it is perhaps half done. The work in the afternoon is more tiresome, as the sun shines so warm and there is no breeze stirring. The horses walk very slowly, and it seems as if no amount of urging will make them go faster. The warm sun makes one very drowsy, and oh, how good it would be if one could but lie in the shade of one of those trees and go to sleep! The cool shade and the soft grass call you never so strong, and what would you give to get off but a for a few minutes! But it is haying time and there must be no sleep from four-thirty to eight, inclusive. The afternoon wears away slowly; you hear nothing but the rattle of the machines and see nothing but the myriads of timothy stalks falling. But

suddenly a rabbit jumps from in front of your cutter bar. He pops out of the standing grass and goes bobbing along over the cut hay to the pasture. This reminds us that the field is nearly done, for the rabbits always work toward the center of the uncut grass, until there remains only a narrow strip to be mowed. Then they jump out and go bounding along over the grass till they find some place to hide. Sometimes we find a nest of young rabbits, which are either too scared or too young to run, and then the machine must be stopped till they are removed. Or perhaps they will be covered so that they cannot be seen, and then the relentless steel goes slashing through their bodies, breaking their bones and mangling their limbs, and the driver does not know till he finds their tattered remains on the next round. Or it may be that only one leg is cut off, and then the poor little creature is left to suffer for hours and die, or live a life of misery and torture, unless the driver finds it and is kind-hearted enough to end its torture. The piece rapidly grows smaller, and soon there remains but one swath to cut. We finish this, and as we are raising our bars we hear the supper bell. As she hears it one of the horses whinnies in a sort of a satisfied way, for she is a wise old creature and she knows that the bell tells us to quit for the night. After reaching the house we put the horses in the barn and prepare for supper. Supper over, the cows must be milked again and the horses tended. We are through by eight o'clock, and we go back to the house and wash up again. The day's work is done, and it has been a long one—fifteen hours and a half, and any one who puts in that much time on manual labor will be tired. But we do not go to bed, for THE INDEPENDENT has just arrived and we must see it. But it is nine o'clock too soon, and as the air lies heavy on our eyelids, we go to bed to relieve the weight.

PHILADELPHIA.

Literature

Mr. Mitchell's Book

It is a deeply interesting and instructive work which Mr. John Mitchell gives to the world under the title, "Organized Labor, its Problems, Purposes and Ideals."* Obviously, it is not entirely his own. The social and historical knowledge and the argumentative skill are contributed by Dr. Walter E. Weyl. But tho Dr. Weyl has furnished much of the matter and has doubtless supervised the diction throughout, the book is, nevertheless, to be regarded as Mr. Mitchell's. It is his beliefs, his experiences, in the main his reasons, that are recorded, and even his peculiar manner of expression is abundantly revealed.

The book is a comprehensive statement of the social and industrial views of one who is generally regarded as the ablest representative of organized labor now in its ranks. Such a book must have, by mere reason of its representative character, high value, even should it be badly planned and badly written. Mr. Mitchell's book, it must be said, has the distinction of revealing excellent groundwork, the accumulation of a great mass of accurate and pertinent data, and the presentation of facts and views in a style marked throughout by simplicity and strength.

The wage-earner he treats as a person of fixed status—a unit of a permanent class. The wage-earner may lack the class-consciousness which the Socialist insists he must develop if he would be saved, but he is at least conscious of the probability that he will remain a wage-earner.

"The average wage-earner has made up his mind that he must remain a wage-earner. He has given up the hope of a kingdom to come, where he himself will be a capitalist, and he asks that the reward for his work be given to him as a workingman. Singly he has been too weak to enforce his just demands, and he has sought strength in union, and has associated himself into labor organizations."

The author has been severely criticised for the first sentence of this paragraph by reviewers both private and public, and it is regrettable that he did not support his contention, as he might have done, by a long list of expressions from reputable economists, from Professor Cairnes thirty years ago to Professor Ely to-day.

Tho holding the wage-earner a member of a separate class, Mr. Mitchell somewhat inconsistently denies a necessary conflict of interests between capitalist and laborer. The laborer organizes, he says, and has developed a powerful and intricate mechanism of warfare for purposes both of defense and aggression. But, for all that, "there is not even a necessary, fundamental antagonism between the laborer and the capitalist." It is a kindly view, to say the least, but it needs a more robust support than is given it in Mr. Mitchell's pages.

Collective bargaining, says the author, is the fundamental principle of trade-unionism. There can be no freedom of contract when one who represents all the units of capital in an enterprise bargains with the individual labor unit. The labor unit, except in the rarest cases, can exert no influence or pressure, and must thus accept what is offered him or starve. It is only the collective bargain that can assure an ethical contract. "From first to last, from beginning to end, always and everywhere, trade unionism stands unalterably opposed to the individual contract." Strikes are necessary weapons, he maintains, and the direct boycott—that is, the boycott against the principals in a labor dispute—is justifiable. The closed shop is necessary, and so, too, is picketing in times of strike. He opposes the extreme boycott as it has sometimes been enforced, opposes restriction of output, argues against incorporation of unions, against converting the Federation of Labor into a politico-labor party, and denounces political spoilsmen in the ranks. As to the charges of violence and of antagonism to the militia which are so frequently hurled at organized workmen, he enters a stout demur-

* ORGANIZED LABOR: ITS PROBLEMS, PURPOSES AND IDEALS. By John Mitchell. Philadelphia: American Book and Bible House.

rer. Both of these charges, he maintains, are grievously overworked. That violence sometimes attends labor disputes is regrettably true, but it is exceptional, and in amount is infinitesimal when compared with the violence attending the ordinary course of life. Antagonism to the militia, he maintains, is also exceptional.

Mr. Mitchell contends that "there can be little doubt that with the increasing strength and growing conservatism of labor organizations and with the growth of a fuller and better understanding between labor and capital, industrial conflicts will tend to become less frequent." Yet at times strikes are inevitable and must continue to be so. The contention that "it never pays to strike" he shows to be absurd, and details at some length the actual and potential gains won by strikes, arguing further that even apparent losses, as expressed in dollars and cents, are, in the long run, both morally and materially, gains.

"Strikes have paid, and strikes, when for a good purpose and conducted in a proper manner, will continue to pay. While the workingman has lost during the last twenty years less than one per cent. of his wages in strikes and lockouts, and the loss in time from this enforced idleness has been less than one day per year, the gains derived from strikes, or what has been the same thing, the fear of strikes, have been very much in excess of one per cent. increase in wages. Not only have wages been largely increased, hours of labor reduced, and conditions generally improved, but the whole moral tone of the workingmen of the community has been appreciably elevated."

The last clause of the foregoing quotation can be accepted only as a generalization. There are a number of conspicuous exceptions, most readers will aver, among which are the members of some of the New York building trades and of the Chicago Teamsters' Union. But to the general truth of the statement we believe most intelligent readers will agree.

Mr. Mitchell's book deserves careful study by all students of industrial problems. It is, we believe, the most careful and the most comprehensive presentation from the trade-union standpoint that has appeared in America. That it is partisan is conceded; but the partisanship is broad and tolerant, and, above all, is high-minded and sincere.

Old Testament History

THERE are two ways of writing history; one presents it as an argument, and the other as a picture. One is concerned to establish its positions; the other to tell its story. One shows its processes, weighs conflicting views, makes its readers, to some degree, historians, is an anatomical and laborious science; the other is a joyous art, which clothes the dry facts with flesh, calls up the living past, makes of its readers spectators of the vivid scene. Both ways are good, and whoever is a master of either deserves well of mankind. The former is fundamental, and without a basis in the former the latter is only a play of fancy which offends lovers of the truth. But when both are at their best, the former is the stanch frame work, the latter the architect's finished masterpiece. Professor Smith's *Old Testament History** is in the latter class. It is not a monument of scholarship only, it is an artistic triumph. It is a striking work of the historical imagination. The ancient past lives. The people breathe and act before our eyes. Individual characters develop. The drama unfolds. There is great independence of statement, little argument except in footnotes, sparse and brief, and absolutely no polemic. The structure stands or falls by its intrinsic strength. The author depends upon its obvious coherence and self-consistency. References to the literature are few, tho well selected. Whoever will may examine the materials, which are freely accessible. For himself, he has arranged them in a moving panorama, with lights and shadows and connecting processes and perspective and a background, and his great desire is to make other men see the panorama as he sees it. His success is a rare achievement, to which an unusual directness, simplicity and freshness of style contribute in no small degree.

He has a mastery of the data afforded by the Old Testament and the subsidiary sources which appears easy because it is without effort. It is the mastery of entire familiarity, and of a mind able, by

* OLD TESTAMENT HISTORY. By Henry Preserved Smith, D.D., Professor of Biblical History and Interpretation in Amherst College. [International Theological Library, edited by Charles A. Briggs, D.D., and Stewart D. F. Salmond, D.D.] New York: Charles Scribner's Sons.

endowment and training, to view things in their relations. He knows the biblical documents thoroughly, estimates their yield of historical stuff with almost unvarying clearness and decision, and lays under contribution the history of Israel's neighbors. He could have exhibited the skeleton building, if he had chosen. The ribs are there, altho he does not care to have them show through.

His skill is not confined to matters of external history or biography, tho it treats these down through the Greek period and the Maccabees. It extends to the life of Hebrew thought, and the growth of literature. He shows us the conflicting currents, and helps us to appreciate their force and value. He has an eye for the mistakes of men and schools of the best intentions, and for the unhappy stigma upon the really well-deserving. He notes the varying degrees of intelligence among good men as well as bad, and the calm, relentless judgment passed by events upon individuals and parties. His field is peopled with human figures, and we feel ourselves akin to them. He does not show occasional modern parallels.

The great difficulty facing a writer of biblical history who tries to utilize it as a part of human history at large is that the main sources are also sources of religion for the common man, and therefore precious and fenced about by opinions which, tho not themselves of the texture of religion, are so closely associated with religious belief as to take on religious sanctity for the general mind. In such circumstances the disadvantage of the artistic as distinguished from the purely scientific method is that it offers no opportunity for detailed justification, for the meeting of current objections, or even for explanation, to the candid inquirer, of the rational grounds for unfamiliar statement. There would have been practical advantage, from this point of view, in an appendix. Fifty pages of notes at the end, or even less, might have dealt compactly and sufficiently with certain fundamental questions, and with certain specific opinions at important points—the stories of the patriarchs, and the problems connected with the end of the exile period may be instanced—and would have proved an il-

luminating aid to those who sincerely desire to know the truth.

Such a supplement would be all the more welcome, that there is, in fact, no consensus as to all of the positions taken. Many Old Testament questions are still *sub lite*. In not a few instances Professor Smith's views are such as many would call extreme. The degree of probability varies in different cases. The briefest statement of reasons would be of value, and the effect of the work would not have been marred by an appendix of such great utility.

No competent reviewer would be likely to go into the details of a book like this without joining issue at one point and another. Old Testament criticism is a living and growing thing, whose results are not all stereotyped. Critical opinions are in substantial agreement as to principles, and as to a large proportion of the facts. Agreement on the rest must come gradually through discussion and fresh light. For discussion there is here no room. It remains, then, that whatever divergence there may be in particulars, and whatever wish that a modicum of considerate argument might have found place—as a gradual approach to conclusions which many will find trying—Professor Smith has, by his comprehensive and vitalized history, laid all who care for the Old Testament under great obligations, and has shown that devotion to laborious studies may be so touched with genuine imaginative power as to yield a work of art.

Benjamin Disraeli

THE popularity of Lord Beaconsfield since his death, a popularity that has gone on increasing in a sort of geometrical progression, is a somewhat puzzling phenomenon to outsiders; and, apparently, to a very large section of Englishmen themselves. It is not that any one is inclined to contest his title to be one of the foremost statesmen of the last century; it is because the present idolatry contrasts so curiously with the suspicion and dislike of which Disraeli was the object, among his political friends as well as among his political enemies, until a couple of years before his death. Nor

was this hostility confined to politicians. The leading churchmen, philanthropists, poets, philosophers have often given expression to language in his regard that, at the present day, seems absolutely ferocious. To Lord Shaftesbury, the devoted philanthropist and evangelical leader, he was "a leper, without principle, without feeling, without regard to anything human or divine." To Lord Selborne, the lay representative of the High Church party, he was "an actor in a mask he never tore off." Browning concentrated a world of contempt in a few

phrases, such as "Beaconsfield the Jew." Carlyle, who, however, reconsidered his estimate when the Hebrew Prime Minister offered him a title and a pension, sneered at the "superlative Hebrew conjurer," who was also "a poor creature," and reviled John Bull for letting "this Jew jump upon his stomach." Mr. Chamberlain, destined to be the heir of his policy, entered on his parliamentary career with the solemn declaration: "I do not think that Mr. Disraeli,

if he tried, could speak the truth." Yet, in spite of foes whose personal integrity added weight to their crushing invectives, and of aristocratic friends who obeyed resentfully and restively the authority an alien and a plebeian dared to exercise over them, Lord Beaconsfield won the battle in the end. The victory came late, came when he was past enjoying it, but it was a splendid outcome of the struggle between pure intellect and race and class prejudice combined. It would be ungenerous to withhold one's admiration, and even one's respect, from the indomitable will, the courage and tact that achieved such a result in the face of such opposition.

The critical circumstances of the last few years have made his figure loom larger than ever on the English horizon. The Conservatives, or at least the rank and file of the Conservative party, are becoming more and more convinced that "one blast upon his bugle horn" would have greater effect in rescuing the little island from the evils it suffers now and fears in the future than all the efforts of the small statesmen at present guiding its destinies in such blundering fashion.

Altho the number of books written about Disraeli—some impugning his character and motives, some lauding them, but all claiming to penetrate the Asian mystery, to read the riddle of the sphinx—would make up no inconsiderable library, the present work* is certainly about the most attractive and amusing that has yet appeared. Mr. Meynell writes in a very plain, unpretentious, rather free and easy style, a style as unlike the sparkling and gorgeous manner of his subject as can well be imagined, but it

BENJAMIN DISRAELI

has grace, vividness and color, and the simplicity harmonizes admirably with the anecdotal character of the volume, which is a cross between a biography and an autobiography. Disraeli tells his own story, and the author comments on the incidents in a sort of unconventional way. He has no enigma to solve, no mask to raise, and for the very good reason—so thinks Mr. Meynell—that there was no enigma, that the seeming mask was an honest face. His theme is Disraeli as son, brother, friend, and if the political speeches and ro-

* BENJAMIN DISRAELI, *An Unconventional Biography*. By Walter Meynell. With 40 illustrations, including two photogravure plates. New York: Appleton & Co. \$3.00 net.

mances are touched on, it is only when they help to elucidate the purely human story. What we have here are the statesman's letters, most of them published for the first time, the table talk of Downing Street, of his town and country residences, and of the smoking rooms of the Carlton Club and of the House of Commons. It is easy to imagine what a delightful book could be constructed out of such material skillfully used. Almost every page is lit up by an anecdote, a witticism, a sarcasm or a striking reflection on the men and events of the time.

Lord Beaconsfield is said by his present biographer to have been the most good natured and forgiving of men. It must be confessed that very little of these genial qualities appear in his jests and repartees. They are often very mordant, not to say venomous. When Lord John Russell, who concealed a great soul in a diminutive and withered body, became the leader of his party in the House, Disraeli called the attention of his friends to this leadership as "a modern illustration of the ancient worship of an insect." To an author from whom he accepted a book he had no intention of reading, he said: "Many thanks; I shall lose no time in reading it;" which is hardly as neat, however, as the formula which Oliver Wendell Holmes ascribes to "the master," who, after a few flattering adjectives about a similar presentation volume, added: "I am lying under a sense of obligation." Disraeli, when asked his opinion of Chamberlain's maiden speech, answered, in a tone of mild surprise: "He wears his eyeglass like a gentleman!" The aristocratic jibe did not come with a very good grace from one who, on the score of birth, had little superiority over the member for Birmingham. His answer to Lord Aberdare, who, after he had taken his peerage, asked him how he liked it: "Well, I feel that I am dead, but in the Elysian Fields," probably represents the feeling of most statesmen who have been "pitched into the Upper House." The Princess Mary of Cambridge, very patriotic, very impulsive, and always anxious for the Government to make a move against Russia, said to Disraeli (then Prime Minister) at a dinner party: "Why don't you oppose them; what are you waiting for?" "The potatoes, ma-

dame, at present," was the reply. His explanation of Queen Victoria's great liking for him is no doubt as true as it was witty. "Gladstone treats the Queen like a public department—I treat her like a woman."

By the way, Mr. Meynell does not adduce the slightest evidence for his statement that the primrose was the favorite flower of Disraeli, who has never even mentioned it except in "Lothair," where he states that the leaves are capital for a salad. If he had had a favorite, it would surely have been some flaring bloom, an orchid or a dragon lily, not the modest primrose. In the motto of the wreath laid by the Queen on his tomb, "*His favorite flower*," the pronoun stood for her deceased husband. It would seem as if after his death as well as during his life a certain amount of humbug must always be associated with the history of the great imperialist.

One of the most fascinating chapters in the volume is the long and exhaustive analysis of "Sybil," a novel that has exercised more influence upon English social life than all the rest of his stories together, a book as autobiographical as "Contarini Fleming," and in which we get closer to the heart of Disraeli as a politician. If the secret of the mysterious statesman be ever discovered, it will be revealed to some profound psychologist who has made a thorough psychological study of this book, and, perhaps, of "Lothair." As to "Endymion," we dissent from the opinion that it, like all the other romances, is a *roman à clef*. It is easy to recognize Cardinal Manning, or at least his outward features, in the Cardinal Grandison of "Lothair," "the Radical Cardinal, who wore the red and was red at heart." But the Nigel Penruddock of "Endymion," who becomes Archbishop of Westminster and Cardinal, has nothing distinctively of Manning about him except his titles. He has more of Newman or of Oakeley. The whole work is rather a gallery of composite photographs than of portraits, except, perhaps, the Sainte-Barbe, who has been identified as Thackeray, an unhappy incident in Disraeli's literary career, for a redeeming feature of his character was the temporary nature of his resentments, never, except in this instance, carried beyond the tomb.

As an *advocatus diaboli*, Mr. Meynell is far more amusing than convincing. But he is honest, and the reader can form his own judgment, for he has all the documents relating to certain shady phases of Disraeli's life before him. We do not believe that the author's special pleading will affect the opinion of any one, except a Dizzyite who is past redemption, on Disraeli's sudden *volte-face* from pure radicalism to extreme Toryism, or on his mean and shabby treatment of Sir Robert Peel.

Edith Wharton's New Novel

THERE was a time when writers of fiction were content with the narrative form. All our battle grounds were in the open, and the interest of the tale depended upon action, prowess, visible accomplishment. Only a few sages had discovered our psychic regions, and no one suspected their dramatic possibilities. But now the novelist with his colored crayon literary style and illuminating imagination has traveled thither, so that our romances, no less than our philosophies, are founded upon these deeper aspects of life. Poor human nature is being tested and tempted by every author in the country, some with a view to proving its evil possibilities, others with the nobler aim of rescuing a few virtues. Mean-

while the reader is amazed and edified at this demonstration of his highs and depths—is likely, indeed, to receive an overweening notion of his importance from the revelation. For, after all, life is not made up of "crucial instances," as Edith Wharton and other writers of her class would have us believe. And the things that challenge honor are usually more tangible than the subtleties with which she teases conscience.

Kate Orme, the heroine of her new novel,* is a young girl, well bred, innocent and romantically sincere, who discovers in the man she is about to marry

* SANCTUARY. By Edith Wharton. New York: Charles Scribner's Sons. \$1.50.

EDITH WHARTON, Author of "Sanctuary"

Copyright, 1903, by Charles Scribner's Sons

a flaw of character. Altho brought up in the midst of the usual social perversities of the rich and sensuous, nothing in imagination or experience has prepared her for this catastrophe, and like an outraged nun she retires, first to contemplate, then to adjust her consciousness to this masculine fatality.

"The pink shades had been lifted from the lamps and she saw him for the first time in an unmitigated glare. Such an exposure does not alter the features, but it lays an ugly emphasis on the most charming lines, pushes the smile into a grin, the curve of good nature to drooping slackness. And it was precisely into these flagging lines of extreme weakness that Denis's graceful contour flowed."

And with her faculties suddenly sharpened by this frightful perception she is suddenly awakened to a realization of the secret, well-bred vice in society about her. She had begun to perceive that the fair surface of life was honeycombed by a vast system of moral sewage. Every respectable household had its special arrangements for the disposal of family scandals; it was only among the reckless and improvident that such hygienic precautions were neglected.

Now it will be remembered that Mr. James Lane Allen's heroine in "The Mettle of the Pasture" had such an awakening from her maiden trance of innocence and happiness. But Mr. Allen is a man and was not disposed therefore to endow the injured woman with a morbid, prophetic subconsciousness, nor with that hysteria of moral pain which makes Kate Orme a feverish, tragic figure from beginning to ending. His heroine does not reason from her own sorrow that there is a universal social rottenness about her; and the reader has the comfortable conviction that if she recovers from the shock of that one glimpse into the dark pit of life, there is a tender, stupid womanly sanity in her which will insure peace and connubial confidence. And whatever the matrimonial tragedies of life prove, or the science of such literary exponents of marital ethics as Mrs. Wharton suggests, these are really the normal women, and in the long run the most effect in the moral order of things. Their very obtuseness is a sort of healing power. They do not condone what is wrong about them, because they do

not know and cannot imagine it. And their native aloofness is an eternal guaranty of morality in society.

But this is not Mrs. Wharton's point of view. She has by a purely intellectual process reached that point in psychic speculation which is esoteric to most people, and in the development of Kate Orme's character she forces the woman to face the agonizing contingencies of life. Having acknowledged that Denis is unworthy of her love, and having indeed conceived a contempt for him, her mind leaps to the contemplation of the future where she sees him married to another woman, who does not know of his dishonor.

"And with this deception between them their child would be born: born to an inheritance of secret weakness, a vice of the moral fiber, as it might be born with some hidden physical taint which would destroy it before the cause could be detected. Well, what of it? Was she to hold herself responsible? . . . Were not thousands of children born with some such unsuspected taint? . . . Ah, but if here was one that she could have? What if she, who had had so exquisite a vision of wifehood, should reconstruct from its ruins this vision of protecting maternity—if her love for her lover should be, not lost, but transformed, enlarged, into this passion of charity for his race? . . .

Now this straining of the maternal instinct into prophecy is not characteristic of any maiden woman, but it is characteristic of Mrs. Wharton's psychic method for generating "crucial instances." This larger "sanctuary" of the feminine consciousness exists only in theory. Whatever may be said of men, the marrying woman only comes to love the race through the child she really has. That is the hypothesis of her maternal relation to the whole world; and it is a hypothesis which does not in the nature of things occur to the maiden mind. The "Sanctuary" that women like Kate Orme affords to tempted men is founded upon no such Quixotic notions of sacrifice, but it consists in their *telepathy* of goodness. There are many righteous women who never are sanctuary for any tried soul, because in them virtue is not vital. It is a form of moral selfishness which actually separates them from the needs of others. But Kate saves her son at the crucial moment from dishonor because for years

he had been sheltered in the holiness of her love, and dominated by the sternness of her integrity. He was constrained to act honestly by the power of goodness that was rarely lodged in another. And to the discerning reader it is an open question whether the young man stood on his own legs or upon his mother's when the test came. And if he did not save himself, the maternal sanctuary is an ethical institution of questionable value.

On the whole, this is the kind of book a woman writes when she conceives her characters all walking upon moral margins too narrow to be quite comfortable. And it does not demonstrate the growth of principles and manly stamina so much as it does a beautiful, tender sentimentality peculiar to women, whether they are writers, mothers or missionaries.

The Yellow Van. By Richard Whiteing. New York: The Century Co., \$1.50.

The author of *The Yellow Van* has chosen for the basis of his story the problems that exist between the rich and the poor in England. Now this question of an ethical and social adjustment between classes and masses is a wall of flaming swords upon which more than one writer has already been impaled. Because the dramatic features are so evident, they fail to appreciate the psychic difficulties upon which the drama rests. Thus the average novelist insists upon representing the "social compunction" as a sort of social hysteria, as a disease peculiar to rich and really frivolous women; and, on the other hand, he never rightly comprehends the motive, the law of life, which leads the indomitable poor to reject the disciplinary measures of rich charity and to persist in working out through fire and blood, if necessary, the foundations of their own morals and salvation. To him this elemental courage of the poor is simply a spectacular form of ignorance and ingratitude, to be presented to his readers in the form of a strike or a riot. Indeed, to be able to portray accurately what is really meant by these conflicting conditions of life is a rarer accomplishment in fiction than it is in any other class of literature. And the veracity

which characterizes Mr. Whiteing's story gives it an unusual distinction. The rich people who ride through it are not all brutally indifferent, or maudlinly sentimental; the grimy, heated laborers who are the protesting victims of dirt and destiny are not too anarchistic. And, on the whole, we receive the impression that the author is making a sincere, rather than a sensational, effort to show the inevitable difficulties of the situation. In these days, when we are supposed to be passing from the narrow obligations of individual righteousness into the larger obligation of social morality, such books have the merit of belonging to the order of things. They are not merely fiction, but they are in a sense diagrams of the way before us, illustrated with pictures from life. Considered purely from the literary point of view, they lack the motive for perfect art, but at least they are serviceable in a less esthetic way by developing what is right and generous in human consciousness.

Practical Journalism. By Edwin L. Shuman. New York: D. Appleton & Co., \$1.25.

Following his former volume, "Steps into Journalism," published eight years ago, Mr. Shuman has now given us a valuable treatise on newspaper work that is by no means as elementary as was his former essay. It is, of course, certain that no one can take this or any other book for that matter and by the mere reading or study of it, no matter how persistent, become a star reporter or a great editor. It was not intended by the author to accomplish any such results. At the same time, however, Mr. Shuman's volume will be found a safe guide for those just entering upon newspaper work, and a trustworthy counselor in many ways even for the veteran editor.

The Life and Times of Thomas Jefferson
By Thomas E. Watson. New York: D. Appleton & Co.

This new life of Thomas Jefferson is not a book to go to sleep over. It is interesting and stirring and new as a Sun

day newspaper. It is a sort of biographical "Les Miserables," written in a breathless, fidgety, nervous style which is constantly straining for flaming effects. There are sentences in profusion with no subject, and paragraphs that are but single sentences obeying no law of rhetoric, human or divine. "Here was the creation of a democratic society in the very citadel of monarchy!" This is one of the multitude of exclamatory sentences dignified with the isolation of a paragraph. One gets the effect of an editorial page of the New York *American*—to whose owner, Mr. Hearst, the book is dedicated. Neither the quality nor the quantity of mercy has been strained by Mr. Watson. In some 500 pages he makes over 30 attacks upon other writers on his subject. We do not mind his frequent attacks upon W. E. Curtis, whose "True Thomas Jefferson" might be truer and whose work "literally swarms with errors;" nor are we offended by the slurs upon Sydney George Fisher's "True American Revolution," and we can abide his sneers at "the scholarly" Henry Cabot Lodge's "Story of the American Revolution," but, when the popularizers of history fall out, honest scholars ought to get their due, as they have not in this truculent volume. Mr. Watson has no respect for scholars, as he asserts over and over again, and as his method of treating history plainly shows. He is especially incensed at Professor Channing, "who professes and writes history at Harvard University," and who is "a collegiate bull in the historical china closet." He points out the "numerous errors in that Students' History of his." He finds it "painful" that the "learned professor" "teaches history in this ramshackle style," and goes astray "in this artless way"—usually upon matters of opinion. As for Henry Adams and Theodore Roosevelt, they are "modern outcroppings of the old Fed-

eralist's vein;" and, apparently, unaware of Mr. Adams's terrible arraignment of Jefferson, Mr. Watson pours the vials of his wrath upon our hapless President,

THOMAS JEFFERSON

From "The Life and Times of Jefferson" (Watson)

who "in his youth" wrote the "Winning of the West." "Professor" John Fiske, of course, gets flayed, as does Woodrow Wilson, "the author of five bulky volumes of this stuff." Daniel Webster does not escape the guilt of his eulogy upon Hamilton, who is made out the villain of the early republic whom the hero Jefferson overthrew. In spite of the faults of the book, those who believe that the Southern State sovereignty theory has no good foundation should read pages 304 to 309, where the legal and metaphysical arguments are set aside, and some undeniable historical facts are offered in defense of the Southern argument.

Where Love Is. By William T. Locke. New York and London: John Lane, \$1.50.

This novel will prove most interesting to that leisure class of readers who spend much time in exercising and tabulating

their own emotions. It does not lack in the heroic element, but one feels that the situation is, on the whole, artificial; the characters are more or less sensual, and the author much too deliberate in their development. The frugal ending where the hero and one woman are saved to virtue and a sort of one armed, pathetic happiness scarcely atones for the great space taken up in portraying the highly trained taste for vice in people of delicate rather than virtuous breeding. Yet the tale is not without its moral for the weak and wilful. The trouble is that such people never profit by the Æsop method of teaching. What they need is the inspiration of nobler precepts than they have already illustrated in their own lives and which are again set before them in novels of this kind.

The Dutch Founding of New York. By Thomas A. Janvier. New York: Harper & Bros., \$2.50 net.

This is one of the many books which the world could well afford to do without. It is sketchy, superficial and inadequate, while a close examination reveals no new contribution to general knowledge in regard to the founding of our city. Many other historical writers have used precisely the same material, and Fiske, for instance, has done the same thing much better in his "Dutch and Quaker Colonies." Mr. Janvier does not stick close enough to his subject. He does not follow the sailors, pioneers and fur traders and their women and children, living with them and showing us what happened. The illustrative minutiae escape him and the great dramatic incidents also. We get nothing whatever about the terrible evening when 500 wild and painted Indians invaded the little town of New Amsterdam, and the cry was raised that "the savages murder the Dutch!" nor is Stuyvesant's Surrender, with all its stirring incidents, treated any better. It is not described at all, and these are only types of scores of similar omissions. A few vague words cover the Indian wars. Mr. Janvier explains about Dutch politics of the early seventeenth century, and tells of the rise and fall of the West India Company at quite sufficient length, considering that the matter has only an indirect connec-

tion with the subject, but events of this period on Manhattan Island, on the South River, at Rensselaerwyck, or at Fort Orange, are passed by in silence. The style of the book is better than its matter or its theories, but even the style is not always suitable. There is a lack of dignity unbecoming history in such expressions as "the glorious fight that Holland put up with Spain" (p. 50); and "Thomas Baxter (who proved himself to be a very bad lot a little later) had the contract for supplying the palisades, which were intended to stand off his own countrymen; but which, in point of fact, never stood off anything more dangerously aggressive than wandering cows" (p. 122).

Pebbles

WHERE THEY THURSDAYED.—J. W. Murphy and wife dined with Noble Fugard and family Thursday.—*Newton (Ia.) Herald*.

....Secretary of Agriculture Wilson is the only member of the Cabinet who openly encourages grafting.—*The New York Mail and Express*.

...."Here, take this rifle," cried the excited showman. "The leopard has escaped. When you find him, shoot him on the spot!" "Which spot, sir?" gasped the green circus hand.—*Scribe*.

....The home of an ex-President of the United States was blessed with a new baby. The family scales could not be found, and recourse was had to the sacred set used only to record the triumphs of the father's famous fishing. What was the delight of the fond parents to find the infant boy weighed exactly *forty-seven pounds!*—*The Christian Register*.

CONTENTMENT.

I envy not the famous men

Of any time or land;

Horatius may have held the bridge,

I've held Myrtilla's hand.

Tho Shakespeare may have written plays

And sonnets not a few;

Yet to Myrtilla I have penned

A joyous billet-doux.

Drake may have circled round the globe,

And tho that pleased his taste,

Suffice for me to have my arm

Around Myrtilla's waist.

Tho Sherman may have made a march

From Georgia to the sea,

A wedding march right up the aisle

Is good enough for me.

—*Life*.

Editorials

Presidential Candidates

MR. CLEVELAND is out of it. So is Mr. Bryan. On the Democratic side the only candidates now really in sight are Judge Parker and Senator Gorman. If Mr. Cleveland had placed himself in the hands of his friends, they would have given him a very respectable number of delegates from the Northeastern States. Tammany's new leader would have supported him in New York, but his candidacy would not have been promoted there by ex-Senator Hill. The ex-President could not have been nominated. He could not have overcome the bitter hatred of the twice-defeated for the twice-elected, the opposition (especially in the Middle West) of those in whose minds he is associated with the money power and the forces of monopoly, and the fear of the no-third-term cry. Judge Parker probably inherits those Eastern votes which would have been cast in convention for Mr. Cleveland, and with them many more.

Here is a candidate of whose opinions concerning the political issues of the time the world has been permitted to have no knowledge whatever. Pages of the Sunday papers are covered with descriptions of his peaceful home life at Esopus, but there is never a word about his political views, except that he voted twice for Mr. Bryan and has for years been an intimate friend of David B. Hill. Possibly this is the safest kind of a candidate for the Democratic Party in its present condition. Judge Parker was an active and practical politician in a restricted field before he was placed upon the bench. His silence now may be due to his political shrewdness as well as to his sense of propriety. He has borne himself well in a place of much honor and dignity. The nomination of the Chief Judge of the highest court in our greatest State, whether before a convention or at the polls, would deserve to be considered very seriously by his opponents.

Mr. Gorman has been a politician all his days. At present in the Senate he is a leader who cannot lead. Anti-imperialism will not be the paramount issue of the Democratic platform next year. With a Southern Democrat and Confederate soldier ruling at Manila, in succession to Governor Taft, it would seem out of place. Tariff reform, it is said, must stand at the head of the list. Surely it would be ridiculous to nominate Mr. Gorman upon the issue of tariff reform. Nor would he stand more consistently upon an anti-Trust and anti-monopoly plank. Those issues would have been highly appropriate for Mr. Tom L. Johnson, but he, politically, has ceased to live. It is a curious fact that the only candidates now prominent in the Democratic Party are a quiet gentleman of domestic habits, as to whose views concerning the political issues of the last ten years the party knows absolutely nothing, except that he voted the regular ticket; and a professional politician of subterranean ways whose acts have been at variance with the economic policy in support of which the party desires to make its campaign.

Mr. Roosevelt, of course, will be the candidate of the Republican Party; not because last year's State conventions called for his nomination, but because the rank and file of the party throughout the country now want to vote for him in 1904, and will cause his nomination by acclamation next summer. It is an open secret that he has had enemies in his party since he directed Attorney-General Knox to sue the Northern Securities Railroad Trust. That act wrecked the plans of men whose power in the world of finance and manufactures and transportation is enormous. Suits against the Beef Trust, successful recommendations for legislation that would subject great corporations to the light of publicity, and the settlement of the anthracite coal strike by arbitration, intensified the resentment which the first interference with

the projects of these gentlemen had excited, and which has been shown in various ways during the last few weeks. These offended capitalists have always known that they could not prevent the nomination of Mr. Roosevelt. They have sought so to exercise their influence that he would be constrained to appease them by some concession or pledge. Here they exhibited a strange ignorance of the President's character.

It was in October last, while the State campaigns were in progress, that Mr. Roosevelt made a brief statement which did not gain general circulation. He said:

"I do not expect to be elected President by the Trust promoters who are fighting for special privileges, nor by the radical labor union men who would shut out all other men from an opportunity to work, nor by those who would close the door of hope against the negro as a citizen. They are all demanding special privileges which cannot be recognized by the President, whose oath of office binds him to execute the laws for all alike and recognize none as above the law. If I am elected to this high office, it must be on my record as the executor of the law without favors or discrimination."

The man who talks that way, and means it, as undoubtedly Mr. Roosevelt does, is not to be frightened by manufactured rumors of defection in Indiana and Yonkers, N. Y. Yarns about an impending and formidable movement for Mr. Hanna have no terrors for him. He neither shivers nor shakes when he hears the dire threats of a dozen Lily White Republicans in Alabama. And if he disagrees with his loyal supporter, the Senator from Ohio, about the expediency of retaining Perry S. Heath as Secretary of the National Committee, he frankly tells him so.

In the present state of public opinion, a President desiring renomination and re-election is fortunate if the people realize that he has incurred the enmity of Trust promoters, railroad consolidators, and manipulators of the stock market. If the friends of Mr. Roosevelt should prove to the public that men of this kind had set out to annoy, to worry, to humiliate, and, if possible, to defeat him, he would get the votes of half the Democratic Party in November next.

A Southern Victory

THE decision of the trustees of Trinity College, at Durham, N. C., to support Professor Bassett in his liberty of speech on the negro question, is a most notable victory, perhaps epochal, of the better over the worser South. It is a victory of the more silent, thinking South, the coming South, the outlooking South, the ethical and religious South, the fearless South, over the back-turned, timid and provincial South. The vote, 18 to 7, is conclusive. It represents the best conscience of one of the two largest denominations in the South, for Trinity College is one of the principal institutions of the Methodist Episcopal Church South. President Kilgo made a noble fight for liberty against the politicians, and he has proved himself one of the strongest men in the South. The pressure brought to bear on the trustees by the political press was great, and it is much to their credit that the trustees resisted it. Especially was this due to the broadmindedness of the President of the Board, Mr. J. H. Southgate, and Mr. Benjamin N. Duke, the wealthy North Carolinian who has made the college the wealthiest in the South. Further than this, and perhaps even more instructive and assuring, is the fact that the overwhelming sentiment of the students supported Professor Bassett in his liberty of utterance, going even to the unnecessarily spectacular extent of burning in effigy a Raleigh editor who had led the attack upon their Professor. Such an exuberant demonstration was not commendable; but the convention of North Carolina editors were really humorous when they denounced it as an interference with freedom of thought. But the students had not demanded that the Raleigh editor should be removed, while the editor had advocated the removal of the Professor.

Now we do not pretend to say that these trustees and these students indorse all the utterances of Professor Bassett. That is not the question. We should ourselves hesitate to indorse what he said about Dr. Washington. Comparisons of the kind he made are not easily justified. But we are glad he said what he did, because it adds emphasis to the support given him by trustees and students, which

is a support not of his utterances, but of his liberty of speech. Give us liberty of speech, or we shall have intellectual death. Give us liberty to think and speak, and it makes no difference what error is promulgated, truth will surely prevail in time. The first victory must be for liberty; the second will be for truth.

A more important victory could hardly have been gained. It is a lesson for all our institutions of learning. We seem to see a blush overspreading the face of a certain State institution in Kansas, as this story is read. A certain university in Rhode Island appears to glance backward with a suspicion of regretful shame. This ringing victory will confirm academic freedom the country over. For it concerns a subject in which it was most difficult to allow freedom, a subject on which that section was most sensitive. If on the negro question people can think and speak freely, then they can on any subject.

Men said that Professor Bassett would have to go. The Associated Press said it; the North Carolina newspapers said it; the press of the entire South said it; they declared that such a man was not fit to teach Southern youth; and they gleefully declared that the fate of Professor Sledd, of Emory College, Georgia, for a similar offense, would be that of Professor Bassett. They did not know, and we feared they augured truly, we did not know that Professor Sledd had simply moved across the line into an Alabama college of the same Southern Methodist Church; nor did they or we know how imperfectly the press represented the people, altho New York and Chicago elections might have taught us the lesson.

We have not feared that the outbreak in the South against the negro's civil and political rights would be permanently successful. We know of the lynchings; we have observed the suppression of negro suffrage; we recall the revolutionary abominations at Wilmington, N. C., a few years ago. But none of these things move us. We put our trust in the sure growth among the white men of the South, in a younger generation, with men of wider view, of broader education, men that travel and see something beyond the provincial, of a sense of justice to an unfortunate race; of more than

a sense of justice, of an honest desire for their elevation, which will almost keep pace with the wonderful zeal of the negroes for education and uplift. In this is the promise of the time when there shall be no more negro question, only a human question, a question how human beings, treated equally as individuals, can be refined into the image of God.

Great credit is due to President Kilgo and the professors of Trinity College, who dared say right things, that seemed unfashionable and dangerous, in *The South Atlantic Quarterly*, to the generous students and to the courageous trustees who supported them. If the Raleigh and Charleston papers rage, they can laugh at it as a vain thing. The bottom valley has been passed; the path now moves upward.

Liberty of Opinion Denied

How many Americans know that a law of the United States forbids admission to this country of any person "who *disbelieves in* or who is opposed to all organized government, or -who is a member of or affiliated with any organization entertaining or teaching such disbelief in or opposition to all organized government?" It has been supposed that the American was born to a heritage of freedom of belief, and that he was guaranteed the right of freedom of speech so long as he did not slander or incite to violence. That the national Government could proscribe any class of philosophical opinions, however reprehensible in themselves, would not have been believed in this country a generation ago.

The law from which we have quoted was enacted last March, and was aimed at the exclusion of dangerous anarchists. No thoughtful man can deny that the events of recent years have raised a serious question of the extent to which avowed anarchists can be harbored and protected in a civilized community. We do not ourselves believe that all the assassinations and bomb throwings attributed to anarchists have been committed by them. In most instances, doubtless, the offenders have been unbalanced characters, to whom anarchistic doctrines have appealed, and who have found comradeship and

protection in anarchistic affiliations. Anarchists have fraternized with the most dangerous characters in the community, and have allowed them to use the anarchistic name. They are themselves to blame if in the horror that repeated assassinations have created throughout the civilized world, governments have gone too far in repressive measures.

But when all this has been acknowledged, the further fact remains that the clause in the law of March 3d, which puts anarchistic opinion under the ban, is indefensible. Under it some of the noblest minds that have contributed to American civilization might have been excluded, and some of the most unselfish idealists living in Europe to-day would have to be excluded if they came to an American port. The doctrine that all government of man by man is morally wrong seems to a majority of human beings absurd, but some of the best men that have lived in this world have believed and taught it. Tolstoy is its great apostle to-day, and no one will accuse Tolstoy of wishing to plunge humanity into sanguinary disorder. The practically equivalent doctrine that all government that rests on force is wrong has been maintained by the Quaker population of our country even to the extent of refusing to make oath and bear arms, and the Quaker faith has been respected by the State and Federal Governments.

It is not necessary, however, to defend these doctrines in ever so slight a degree before protesting against a law that proscribes opinion and its reasonable expression. Let opinions be beyond any doubt reprehensible; they cannot be eradicated or suppressed by a governmental policy. Wrong opinion can be overthrown only in the atmosphere of freedom. It must come to the light in frank expression, and be attacked by the weapons of reason and conscience. The whole history of civilization is a demonstration of the superior wisdom of untrammelled discussion. As we have more than once remarked in these columns, the postulate upon which the whole doctrine of repression rests is inherently absurd. It is the assumption that mankind is not, on the whole and in the long run, amen-

able to reason and sensitive to moral appeal. If this were true popular government would be in the nature of things impossible, and the stupendous social mechanism of church and university, with all the agencies that they are bringing to bear upon the conduct of men, would be both meaningless and futile.

A case has arisen that we earnestly hope will be carried through to a decision by the Supreme Court. John Turner, an English anarchist, is held at Ellis Island because of utterances in England and elsewhere that come within the *mala prohibita* of this reactionary law. Happily, it has aroused a vigorous protest by men whose words carry weight in the community. A great mass meeting was held at Cooper Union a few nights ago to voice their opposition. Edward M. Shepard sent a fearless and manly letter that admirably stated the true American doctrine of liberty of thought, and John DeWitt Warner placed himself on record in a speech marked by breadth and good sense. The list of vice-presidents of the meeting included many of the most eminent and respectable names in thought and affairs in New York City. We were sorry to see Bishop Potter in a public address a day or two after taking the position that no one "could blame the Government for excluding a man from this country who boasted that he did not believe in any Government." With Bishop Potter objecting to liberty of opinion, and Bishop Burgess characterizing Wagner's "Parsifal" as sacrilegious, it would seem that the people must for the present look to others than our ecclesiastical dignitaries for the wisest guidance in matters that pertain to the great things of liberty and idealism.

The Expansion of the Sentiment of Freedom

FOR some centuries, at least ever since Magna Charta, men have been fighting for their own rights; we are now fairly in the period when we are concerned for other people's rights.

The War of the Revolution was a struggle for the right to freedom of those who fought it. Our Civil War was a

struggle, half-conscious, for the right of freedom for other people. It began in the resolve to maintain the unity of the nation; it ended in the liberation of three million slaves. That was a great lesson to the nation, that the sense of justice and the demand for the rights of liberty and equality are not selfish, but must be generous and altruistic.

It was the growth of the sentiment of freedom that underlay the action of this country in the Spanish War. We could not longer endure it to see the child beaten by the bully, Cuba oppressed by Spain. Doubtless other elements entered in, but this was the predominant one, and it found expression in the extreme and unwise declaration beforehand that we would not seek the annexation of Cuba, a promise that we kept to our loss. But as soon as we had freed Cuba, while the island was in our control; we spent money and life in its regeneration from disease and suffering that it might hopefully begin its career of freedom. Never was one country treated more generously by another.

And so we treated the other islands that came to us from Spain. The Isle of Pines we give up to Cuba, to our loss. We hold Porto Rico, for its own benefit rather than ours. We establish equal rights; we teach its people the exercise of the suffrage; we give them an increasing measure of self-government; we furnish them with schools; indeed, we give them, mainly for their sake, not ours, the benefits of freedom and enlightenment. We take nothing from them, we interfere not with their business or their religion; we give them the liberty they want, and that has been our main purpose and intention.

It has been the same in the Philippines. The main purpose of our people has been to benefit these islands. We have talked somewhat of subsidiary advantages we should gain from their possession, and numbers of people are trying to get rich there; but the first thought has been the welfare of the people. Even our suppression of the insurrectionists, who thought all foreigners were Spaniards, was for the sake of those who had to be whipped like foolish children. It was for their sake, that we might teach them the blessings of freedom and increasing self-government, that we hastened to

transfer the rule from the military to the civil power. It was for this that we separated State from Church and established a complete school system. It is for their sake, not ours, that we are planning to give them at least approximate free trade with the United States, as we have given free trade with us to Porto Rico. We have the right to understand and to claim that our attitude toward the Philippines is not chiefly selfish but altruistic, and that it grows out of a love of liberty and happiness not for ourselves only but for others.

Our attitude toward the new nation of Panama has not been chiefly altruistic, but that sentiment has entered into it. Our maintenance through the Monroe Doctrine of a kind of protection over the other American republics has been in part dictated by our advantage, and in part by a real sympathy for them. It has been chiefly for our honor and advantage that we have been quick to recognize Panama, but with it we rejoice to know that our protection of the new republic will be greatly to the advantage of a state which does not belong to us.

The intense sympathy which we felt for the Armenians and Macedonians, the readiness and generosity of the gifts to those who have suffered from these atrocities, are other illustrations of the growth and power of this outflowing, helpful sympathy. But this higher international Christianity finds proofs in many countries. The Hague Tribunal is one evidence; the growing dislike for war, and the fellowships of international labor and other organizations, also illustrate the fact. The world is learning that it is one organism, and that each part is responsible for the welfare of every other part. If one suffers, all suffer with it; if one rejoices in prosperity and liberty, all the others also rejoice.

The Federation of Protestant State Churches in Germany

FIRST and foremost among the prime problems that are engaging the attention of the church in the land of Luther is the organization of a federation of the four dozen State Churches into which the Protestant Church of Germany, which as such has no existence, but is only an ec-

clesiastical idea and ideal, is divided. The impetus to the consummation of this project was given some eighteen months ago in the famous anniversary speech delivered by the Emperor in Gotha, and it is an indication of the favor with which this proposal met that tangible results are at hand at so early a date. Fortunately, notwithstanding its sadly and badly divided conditions, the German State Churches possessed in the unofficial, tho influential, Eisenach Conference, a body enjoying the confidence of all concerned, and to them was intrusted the work of making this scheme a fact and a reality. The conference, which consists of representatives of the different Churches and has successfully carried out such projects as the revision of the Luther Bible, and the selection of new pericopes, or church lessons, for the churches of the whole empire, selected a committee of thirteen to formulate a plan, and this committee has just reported, presenting its proposals in a set of ten propositions, and these are now vigorously discussed throughout the length and breadth of the empire.

As was suggested by the Emperor, the committee does not propose a union of the various Churches, but only a federation and a co-operation in matters pertaining to the church at large, the federation to find its external expression in a body of men called "*Deutscher Evangelischer Kirchenausschuss*," who shall act as official representatives and as an executive committee. The suggestion of forming an actual union was, for the best of reasons, dropped in the very outset. It is not possible to achieve the impossible, least of all in Church affairs, and nowhere less than among the Germans. These have themselves the current saying that where there are two Germans there are three sets of opinions. The fact of the matter is, that while they are accustomed to find an argument against the separation of State and Church in the existence of the one hundred and fifty and more sects and sectlets of America, they themselves in teachings, trends and tendencies are more widely separated than are the American denominations. Internally and doctrinally American Protestantism possesses a greater degree of unity and harmony of doctrines than is

found in the Protestant churches of the Fatherland, where the schools and theological classes are not divided by the incidentals and accidentals of Christian doctrine and dogmas but by the essentials and fundamentals. The problems that are involved in the Babel-Bibel controversy or in the debate between the Ritschl and the conservative school of Frank are the possibility and certainty of theological knowledge, the character and inspiration of the Scriptures, the divinity of Christ, the work of atonement, and the like. An organic union of Churches that are not agreed on such matters is *ab ovo* excluded. Indeed, it is especially stipulated that the confessional status of each and every Church shall remain what it is, notwithstanding the new federation.

There are the best of prospects that this plan will be realized; not because there are no opponents and objectors, but because in this case, as it was politically in 1870, the centripetal forces are stronger than the centrifugal. Instinctively, all but the confessionals, especially the "Old Lutherans," have felt the need of co-operation of the State Churches, and it is this feeling that promises to force the acceptance upon the Church at large. Rather singularly, the opposition, even as voiced by the conservatives, is directed not against the scheme as such, but against making Berlin the headquarters and the Prussian Consistory the organ of the federation. The conservatives do not want this because they fear the Unionistic tendencies that prevail in the Prussian Church ever since in 1817 the Reformed and the Lutheran Churches were by royal decree combined into an "Evangelical Church," based on the agreements between the two historic communions. Equally remarkable is the fact that the liberals, who have rather been favored by the Prussian authorities in recent years, especially in the scope given to their teachings and tenets in the universities, also seriously object to Berlin and the Prussian church authorities, but they do so for the reason that the Emperor, who is the *Summus Episcopus* of the Church of Prussia, is altogether too friendly to the Pope and to the Catholic Church, and some are beginning to recall with some anxiety the old

prediction that the house of Hohenzollern would return to the fold of the "only saving Church." William II's Roman Catholic policy has given serious offense to his Protestant subjects and is proving an obstacle to the realization of his scheme for the co-operation of the German Protestant Churches.

Up to the present time none of the Churches have had an opportunity formally to accept or reject the Eisenach proposals, but as voiced by the German church press, they seem to find general favor. True, the representatives of two or three small Churches, notably those of ultra-conservative and Lutheran Mecklenburg, in the conference itself declared that these would not be accepted by their people; yet this need not necessarily interfere with their final acceptance by all. Until a few months ago one of the Reuss princes protested against the organization of the empire in 1870, and even to the present day the Guelfs of Hanover will not accept as a *fait accompli* the annexation in 1866 of that Kingdom by Prussia; but all this has not interfered with the growth of German unity. German theological thought has been a powerful, perhaps the most powerful, fact in modern religious developments; but the German Church as such has not. The conviction that it ought to be great in this respect, too, and that especially it should be able to present an undivided front over against the serried columns of the Roman Catholic Church, which in Germany, by its very contact with Protestantism has become Protestantism's most powerful antagonist in the contest for the control of all those factors and forces that now decide the course of events, in politics, literature, science, research—this conviction is all powerful in the hearts of the German Christians, who have learned in the course of time to look with more indifference than formerly upon those dogmas and doctrines that since the days of the Reformation have never permitted the German churches to become one solid phalanx. The project of effecting this federation is favored by the whole trend of religious and theological thought and life in Germany. A good beginning has been made. *Vivant sequentia!*

The Farm a School

WE do not get anything like a complete apprehension of country life when we speak of its profits and pleasures. The chief fact to be considered is that, in the country, we are at school. Some years ago a French author published a book, entitled "The Population of a Pear Tree." He found every tree very full of peoples. The relations of all these lives to each other, and to human beings, is a volume that nature opens before any one who cares to study. Asa Gray used to speak of the trees as his professors. The college that he attended was "the valley before his homestead, set around with orchard-covered hills," and everywhere man and nature at harmony. President Jordan, of Leland Stanford, says that "the best thing that a college can do for a young man is to bring him into the right sort of contact." The country home not only does this, but it furnishes the curious mind with the very best object lessons, to inspire the mind and purify the heart. Professor Search in his "Ideal School" insists that every child is a born naturalist; that his eyes are open to the beauty of the flowers, and to the charm of all life about him, as an endowment of nature. So it comes about that in making a country home you are really establishing a school. Every leaf, and each twig, and the pebbles in the brooks are object lessons to be studied. You did not think that you were building a school house, but a mere dwelling house; yet see how wonderfully things come about. You find that your whole property, not the house only, but the garden, the orchard, the corn field and the potato patch, are all parts of an educational plan; and children are born into it to find out what they can of its wonders.

But even more important is the fact that the home in the country, with wise and open-eyed parents, becomes not only a school of instruction but of application. Every one of the sciences can here be immediately put into practice. Botany goes to work in the garden, and entomology in the orchard. Geology finds its place everywhere about the farm, in its soils and water courses; while chemistry is the very basis of systematic agriculture. The idea is just beginning to dawn

on the minds of our leading educators that, after all, the greatest educational institution is a well conducted farm. It is learning by doing. Professor Kern wisely states it in this way:

"Along with his study of the kangaroo, the bamboo and the cockatoo, why not study the animals on the farm, and their proper feeding; the care and composition of the soil of the farm, the improvement of types of grains and vegetables, and the protection of birds beneficial to the farmer?"

We have come upon a few homesteads where it is understood that arithmetic does not find its highest application in problems of banks, stocks and brokerage, but in the practical affairs of production. He solves a greater problem who doubles the quantity of corn grown on his father's acres, or improves the quality of potatoes and beans, than he who succeeds in working out a quantity of theoretical examples without practical application. Professor Whitman, of the Marine Biological Laboratory, at Woods Holl, writes that the study of living plants and animals, under control and cultivation, is what is now most needed for further advance in biology. He says that we cannot hope to make much more progress in the study of the laws of heredity until we have the means of investigating the phenomena in a series of generations, and under conditions that admit of decisive experimental tests. It is along this line that the aviary of Professor Scott, of Princeton, shows its practical nature. The project of a "biological farm has interested me," says Professor Whitman, "and I believe that is our next step in the study of nature. The biological laboratories of to-day, in design, equipment and staff, are almost exclusively limited to the study of dead material." Botanical gardens and zoological parks have been utilized to some extent, but they are adapted to show purposes mainly, and are of little value for research. A biological farm, which brings observation, experiment and reflexion together, makes them omnipotent; but disjointed they become impotent. The biological study of to-day has not too much laboratory, but too little of living nature. The farm will certainly do much to mend this deficiency. The farm would enable us to work out life history,

bring us face to face with instinct, put it under control, so that we could handle it, photograph it, analyze it, read its history and extort from it an answer to our question. We are following Professor Whitman somewhat closely in his argument, because he seems to appreciate most fully, among our educators, the exact relation between knowledge and the application of knowledge. He wants a huge research farm established in conjunction with Woods Holl, in order to make biological research something practical and complete. He says:

"The farm would enable us to approach all the fundamental problems of life from the two sides of observation and experiment. It would furnish material for study with precise records; and would make it possible to sustain continuity in experimental study."

This is a deserved and magnificent recognition of the farm. It does not fully acknowledge the great fact that, while many of our ablest men have been working in laboratories and museums, other equally great men and able men have been plowing out, and hoeing out, and planting out some of the most important problems in life's history. Great progress has been made already on our best farms in the way of biological research and the solution of those problems which bear upon human progress. The laboratory has done its work, and the farm has done its work; the problem now is how to bring these two together,—so that every farm shall ultimately become a true school of nature, a place where botany, entomology and zoology in all its forms shall be made contributive to human welfare. Nor is there anything to hinder just as direct application of mathematics and mental sciences. Mathematics on the farm measures wood, surveys land, and solves hundreds of every-day problems for the individual and family, and there are not a few farmers to-day who have in hand work that, with a just estimate, exceeds that of marine laboratories and most elaborate analysis. Farm work is characteristically synthetical, and while it does not often write books, it traces out life problems. There is, however, no need of jealousy—none of comparison. The farm recognizes the value of the school; the school begins to recognize the value of the farm. Bring them together,

and in their co-operation you will have secured that complete education which will hereafter be furnished every human being—knowledge, but not knowledge heaped up in the brain; knowledge applied to life and living.

" Preferential Treatment "

It will be two months before the Tribunal of The Hague will publish its decision as to the Venezuelan claims presented to it by a dozen nations, enough to assure the future recognition of this court, altho it is well known that some of the strongest nations had been opposed to it. The American representatives who attended the sessions, the Hon. Wayne MacVeigh, Judge Penfield and Minister Herbert W. Bowen, bring back the most favorable reports as to the workings of the court, and Mr. Bowen makes an interesting comment on the case. It will be remembered that England and Germany demanded preferential treatment, that they should be paid first, because it was their fleets that brought the pressure upon Venezuela. Mr. Bowen says that, if we were a little further advanced in civilization, the distinguished arbitrators would doubtless have been asked to decide that, if preferential treatment should be given to any creditor, it should be to those who refrained from resorting to war and used their best endeavors to collect their claims by diplomacy. Why not? The suggestion turns the tables handsomely on the Powers that preferred the ways of war. We are pleased to see that Mr. Bowen gives the greatest credit to President Roosevelt for advising from the first that the case go to The Hague. To President Roosevelt, he says, belongs the unique distinction of performing two services for the lasting benefit of mankind. He removed all obstacles to the construction of the Panama Canal and secured the general recognition of and respect for The Hague Tribunal.

A Methodist Eclectic

It is nothing less than comical to hear that charges of heresy have been brought against Prof. Borden P. Bowne, of the Boston University, who is recognized as one of the ablest teachers of ethics and philosophy in the Methodist or the

American Church. It would be fun to hear the trial, and we doubt not it would make clear that some old things have forever passed away; but we presume the charges will be thrown out. The New York East Conference, of which Professor Bowne is a member, is not one to be easily frightened. For several years the revivalist, Dr. Munhall, has been issuing a little monthly largely devoted to proving that Professor Bowne and several others are heretics and hypocrites. He has the ear of a few young graduates, of Bishop Mallalieu and Professor Townsend, who believes that the figures for the dimensions of the New Jerusalem in the Revelation are real geometry, and that heaven is a cube, because the "length and the breadth and the height of it are equal," and that each side is about the distance from his home in Boston to Omaha. We do not know whether, as intimated in the local papers, they have aided the young graduate who has brought the charge, but anything might be expected of such a literalist. They are both doubtless as honest as they are earnest and mistaken. Theirs is the sort of literalism, devoid of interpretative sense or humor, which creates Schweinfurths or Dowies, and which excommunicates those whose eyes open wider than their own.

Dr. Dix's Pessimism Trinity Church faces Wall Street, not defiant, not cowed and silenced, but monitory, looking downward and pointing upward. And more or less the monition is heard and the eye of gain glances above. Yet, in his Thanksgiving sermon, the Rector of Trinity Church declared that in society, in the palaces, in the workshops, in the slums, on the exchange, in the boards of education, in the homes, the word of warning will no more be heard and heeded than if one were trying on the sea-beach to address the howling storm. And so the venerable preacher could scarce find anything to thank God for except for Himself. What does he see? What homes does he visit? We find a multitude of homes to thank God for, where love and honor rule; and we find right principles militant where they are not dominant in society and in the state. Possibly a part of Dr. Dix's discouragement, so ungrateful on a day

given to thoughts of gratitude, is due to his setting up certain extreme standards which his parishioners will not accept. When he should attack the criminality of trivial divorce and tandem polygamy he levels his shafts against those also who have the right to divorce and remarriage; and because they will not "fence the law" with him, because they see better than he the purpose, the real sanctity and right of marriage, he blames the good and the bad together and drowns the pews in needless tears. We assure Dr. Dix that the world is not half bad.

A Naval Parallel It is being suggested that a parallel state of affairs to the case of General Wood would exist if a naval surgeon should be translated to the grade of admiral. Hardly. True, the surgeon might receive the commission and wear the requisite stars and gold lace, but under no circumstances would he be permitted to exercise actual command afloat. Because self-preservation continues to be the first law of nature, it would somehow insensibly happen that other people would do this for him. In brief, he would become merely a bit of foreign matter in the *corpus navale* and rapidly encysted. That is what is done now to incompetent commanders who get their rank by the operation of seniority, and it furnishes a wholesome correction to the working of that law. Gradually it dawns on superior powers that they had better evanesce, and then they are disposed of, navy-fashion, gently, firmly and with no fuss whatever. So would it be with the surgeon-admiral—and he would acquiesce to it most cordially.

Our Catholic Seminaries We printed two weeks ago an editorial on "Our Catholic Seminaries," which we expected would evoke criticism and some denial. The statements we made were all derived from high Catholic authority, as was easily to be seen from reading them. We said, "If we are not mistaken, within five years, Archbishop Ireland has dismissed from his own seminary Professors Shields and Danchy," and we told something of their training and teaching, and mentioned that they had been criticised for their liberal

views, and yet we said in the case of one of these men the Archbishop could not have regarded the heresy as serious, as he had recommended him to the University of Washington. Archbishop Ireland writes us:

An editorial in a recent number of *THE INDEPENDENT*—entitled "Our Catholic Seminaries," does—unwittingly, no doubt, on the part of the editor—grave injustice to two priests formerly professors in the St. Paul Theological Seminary. The plea of the editorial is that those priests were dismissed from their chairs because the suspicion of heresy, or of unorthodoxy of some kind, rested on their teachings. Permit me to assure you, in manner most positive, that in the departure of those priests from the seminary, there was no question whatever of heresy or unorthodoxy at issue—and, furthermore, that at no time before or since has such a question been raised, directly or indirectly, nor could it have been raised in regard to them or to their teaching.

We have other correspondence calling in question our statements. For example, we are told that the reason why Dunwoodie students were forbidden by Archbishop Farley to attend Columbia University lectures was because it interfered with their lessons at Dunwoodie; also that Dr. Ayrinhæ's transfer from the chair of Dogmatics at St. Mary's to that of Morals was simply a promotion. We knew that Moral Theology, which has to do with confessions and penances, is regarded as a more important chair than Dogmatic Theology, but we also recognized that the transfer put one whose teachings had aroused criticism into a "safer" position.

Tillman's Shotgun We need make no comment on this extract from a speech by Senator Tillman at Savannah, Ga., which we find in a Southern paper:

"What others are going to do I know not, but in South Carolina the white man is bound to be on top, and when other methods fail the shotgun is in reserve. I don't want to shoot the negro. People say I hate him, but I don't. I believe in giving the negro all rights but the right to participate in government. He is not fitted for it.

"The inalienable rights of the Constitution are all right for white men. I like to see the negro happy. But when his happiness makes mine impossible, then he has got to get up and get. If other means fail, it will be a question

of whose happiness can shoot the straighter.'

"Educate the negro as highly as you will; give him political equality and social equality will follow. Then will come miscegenation, mongrelization, hell and damnation. Rome had slaves, negro slaves, and we hear nothing of them after the empire fell. The contrast between the Italian of to-day and the old Roman suggests intermarriage with the Ethiopian.

"Educate the negro as you will, you can never educate him to the stature of a white man. It is useless to educate the head when there is no moral fibre, educate as you will, you cannot make him the equal of a white man.'

"In the midst of his speech the Senator turned to a local reporter who was busily taking notes: 'Young man, you are scribbling an awful lot. How much are you going to print?'

"About half of it, Senator.'

"All right, but don't send it out by Associated Press.'

There are Tillmans, but there are Kilgos and Bassetts.

Rural Free Delivery Of course, rural free delivery does not pay; distances are too great in the country.

But it is a convenience that will not be given up. Mr. Bristow, the Superintendent of this department, recommends that the carriers be forbidden to do business for their patrons, just as city carriers are forbidden. But this cannot be enforced. Little express jobs they will be sure to do, to the great convenience of their patrons. Thus local newspapers want the carriers to take subscriptions; and we do not see why they should not even be required to do so when desired, just as is done in postal departments abroad. The machinery would be as simple at least as our money order business. We know that many people who want to renew a subscription neglect to do it because it is so inconvenient to go to a post office for a postal order or to a bank for a check. But this is in the line of the next great advance in our postal business, which will provide a parcels post, to the benefit of everybody except the express companies, which will always oppose it.

To those who doubt whether Christianity is making any progress in India we commend the census of 1901, the figures of which are now being published. Travancore is the largest of all the Native States in the Madras Presidency. It is a little smaller than Massachusetts, and

has a population of 2,952,157. Of these 697,389 are of the Christian faith, or 236 out of every 1,000 of population. During the last decade the Hindus have decreased 327 in each 10,000, while the Mohammedans have gained 25 and the Christians 302. In ten years the Protestants have increased from 44,792 to 88,590, or 97.8 per cent.; the Syrians from 186,782 to 226,619, or 21.3 per cent., and the Roman Catholics from 295,337 to 377,500, or 27.8 per cent.

At present we have free trade with Porto Rico, but against the Philippines we charge a duty of 75 per cent. of what it is with foreign countries, as if the Philippines, which we possess and rule, were three-quarters foreign. There seems no good reason for this wall against our own colony. Governor Taft would have the tariff reduced to 25 per cent.; we would have it removed entirely. It would do much to stimulate business there, and would draw the people to us.

That Dr. Dowie and his great enterprise and city are bankrupt we are not sure. We hope not, for we would be willing to see the experiment tried of a Zion City, where, by the will of the people, all superfluity of naughtiness is excluded. These are hard times for Elijah III, but we remember that Ahab and Jezebel were too much for Elijah I for a while, and that he had to run away in fear of his life and fret under a juniper tree.

The cause of the terrible epidemic of typhoid fever in Butler, Pa., where over a thousand have been prostrated by the disease, is the temporary use of water from a creek which is the receptacle of sewage, while the filter system was being repaired. Of course, there must have been a typhoid patient among those who lived along the bank of the creek. Such an epidemic in the good time coming would send somebody to prison.

We are glad to see that the English are following the American custom of large gifts to institutions of learning. A man has given a quarter of a million dollars to University College, London, and keeps his name secret.

Insurance

Insurance of Bank Deposits

THE Bankers' Surety Company of Cleveland, Ohio, is putting on the market a contract that is designed to indemnify depositors against loss by bank failure. Their circulars set forth the fact that the insurance of bank deposits has long been considered, but that the difficulty of fixing a satisfactory rate has hitherto been an obstacle not easily overcome. The Bankers' Company claims to have been diligent in its compilation of statistics from the records of the United States Government, so that a reliable determination of the average percentage of loss per annum has now been reached. The average annual loss is largely aggravated by the charging of interest account against claims pending payment of receiver's dividends. The Bankers' Company does not intend to write promiscuous insurance on bank deposits or to assume risks without limit. The company will confine its risks per bank to a small line, irrespective of its supposed responsibility. No bonds will be issued until the financial statement of the bank insured not more than six months' old has been carefully studied and digested. The rates now ruling are as follows: National Banks, $\frac{1}{2}$ per cent. on amount of bond; minimum premium, \$5.00. State Banks and Savings Banks, $\frac{3}{4}$ per cent. on amount of bond; minimum premium, \$7.50. Trust Companies will be written only under special conditions approved by the home office. Private Banks and Building and Loan Associations will not be insured under any circumstances.

The Bankers' Surety Company believes that this department of its business will grow in popularity, but those in control of the company consider that an average risk per bank of \$200,000 would not by any means be a conservative figure at the present time. If the scheme as outlined in the circulars of The Bankers' Surety Company is carried out, there can be no doubt but that it will in the cases of policy holders ease what would otherwise be great hardships. The Surety Company will advance the full amount of its clients' deposit in the case

of a bank failure and will look to the bank for reimbursement.

Insurance in Japan

THE *Insurance Journal* (London) is authority for the statement that the Japanese Government has enacted a law relating to insurance deposits, which, if not repealed, will prohibit the operations of foreign insurance companies in Japanese territory. The provisions of the law in question call for the deposit with the authorities of Japan of the full amount of the reserve on all policies issued in the Empire by all except domestic companies. This drastic measure applies to all kinds of insurance companies indiscriminately. There is a general belief prevailing in insurance circles that the law is in violation of treaty rights, since it discriminates against foreign companies by the imposition of conditions not imposed upon home companies. In addition to the deposit of the reserve previously mentioned, a further provision of the new law calls for the deposit also of \$50,000 with the Japanese Government, either in cash or in Japanese public bonds in substitution. A number of American, British, Canadian and Australasian companies are affected by this new order. It remains to be seen what action the affected companies will take.

EMBEZZLEMENTS and defalcations for the month of October, as tabulated in the current issue of the monthly *Bulletin*, show an increase over the abnormally large amount noted for the preceding month. Firms and corporations are again the greatest sufferers from breaches of trust. The October items are given in detail in the table below:

Banks	\$387,000
Building and loan associations.....	108,500
Benevolent societies and institutions....	6,168
Court trusts.....	100,350
Federal and State.....	33,018
Firms and corporations.....	1,173,417
Insurance companies.....	28,156
Municipal	2,236
Transportation companies.....	109,585
Miscellaneous	35,002
Total.....	\$1,988,482

Financial

Cotton Crop and Prices

FOLLOWING the publication, last Thursday noon, of the Agricultural Department's December estimate of the cotton crop, there was a wild advance of prices in the Cotton Exchanges here and abroad. At the New York Exchange all records for a day's business were broken, the sales exceeding 2,500,000 bales. Prices for immediate delivery had risen before the end of the week from a little less than 12 cents a pound to nearly 13 cents, but the close was at about 12½. At its highest point the advance was in the neighborhood of \$3¾ per bale, or \$37,000,000 for the entire crop, as estimated by the Government. What these prices mean may be ascertained by a glance at the record. One year and two years ago on the same date the price was 8½ cents; in 1900 it was 10¼; in 1897 and 1898 it was less than 6. Since last December the advance has been nearly 50 per cent. The Government's estimate on Thursday of 9,962,039 bales was remarkably close to the figures given out a day or two earlier by one or two speculators who have recently made great profits on the rise. The average of private estimates, on the other hand, had exceeded 10,500,000. It is well known, however, that for many years past the Government has underestimated the crop. Its estimates and the actual yields for the last six years are compared below:

	Estimate.	Commercial crop.
1897-98.....	9,600,000	11,216,000
1898-99.....	10,000,000	11,256,000
1899-1900.....	8,900,000	9,422,000
1900-01.....	10,100,000	10,399,000
1901-02.....	9,674,000	10,701,000
1902-03.....	10,400,000	10,780,000

Here is an average annual underestimate of 850,000 bales. It is quite probable that the present crop will not be much less than 10,500,000.

Manufacturers of cotton goods here and abroad are seriously affected by these high prices of their raw material. Their industry had already been greatly disturbed by fluctuations and increasing cost, and nearly half of the 175,000 hands in our Northern mills are now about to suffer a wage reduction of 10 per cent

It is generally admitted that there must be curtailment of output. Ordinary cotton goods are produced upon a small margin of profit, even when conditions are favorable; they are now being produced at a loss. A great majority of the consumers of such goods are persons of small means; a considerable advance of price surely reduces the consumptive demand. Supplies of raw material in manufacturers' hands here and in Great Britain are not large, but the spinners of Germany, France and Russia are said to have bought heavily some time ago. Cotton growers in the South are fortunate this year, but the reported shortage, together with the predicted spread of the boll weevil pest, will stimulate the cultivation of cotton in South Africa and other colonial regions where successful experiments have been made.

HARVEY FISK & SONS report a good demand for the recently offered New York and Harlem First Mortgage, 3½ per cent., 100-Year Gold Bonds.

....The Director of the Mint has completed his annual statement, which shows that in 1902 the United States produced \$80,000,000 of gold and \$29,415,000 of silver. The world's output was \$295,889,600 of gold (an increase of \$32,500,000), and \$88,486,500 of silver, a decrease of 8,000,000 ounces in quantity and of \$16,500,000 in commercial value.

....The subscription price of the \$750,000 of new common stock of the Procter & Gamble Company, to which we recently referred, is \$150 per share to holders of the old stock; but it is really reduced for them to \$50 by a dividend of 14 2-7 per cent. on the old stock, payable on the date of the new issue. Credit for this dividend may be obtained in paying for the new shares.

....Dividends announced:

Amer. Chicle Co., 1 per cent., payable December 21st.

Middlesex Banking Co., Debentures A 64, A 71 and D 9, payable with interest, on presentation.

Fifth Ave. Bank, 25 per cent, payable January 1st.

Plaza Bank, 10 per cent., payable January 2d.

Manhattan Railway Co., 1½ per cent., payable January 1st.

The Independent

VOL. LV NEW YORK, THURSDAY, DECEMBER 17, 1903 No. 2872

Survey of the World

The Field of Politics

At the meeting of the Republican National Committee, in Washington last week, it was decided that the national convention should be held in Chicago on June 21st. Secretary Perry S. Heath was present, altho he did not accompany the committee when it called upon the President. A photograph of the members was taken at the White House, the President being in the center of the group, with Chairman Hanna on his right hand and Vice-Chairman Payne on his left. The sessions were uneventful. A committee was appointed to ascertain to what extent socialism enters into politics and to consider negro suffrage in the South. General Brayton announced that he would not press his resolution for a new basis of delegate representation, as he had been informed that such action would be inopportune. Secretary Heath, who is smirched in the Bristow postal fraud report, had said that he could see no reason why he should resign. Interviews with members of the committee show substantially unanimous support for the candidacy of Mr. Roosevelt. Vague reports as to the possible candidacy of Mr. Hanna had been in circulation, but his friends declared that he would not be a candidate and would not serve as Chairman in the coming campaign. The President gave notice that he must decline to talk with any of his visitors concerning the nomination to be made in June. One subject of popular discussion was an editorial article, hostile to his candidacy, published in a Cincinnati Republican paper of which Secretary Heath was recently the editor and an owner in part. Another was the assertion of a well-known newspaper corre-

spondent, published over his signature, and apparently with the knowledge and approval of the President, that a person representing the Trust, promotion, and railway corporation interests centered in New York had recently sought to obtain certain pledges or assurances from Mr. Roosevelt as a condition upon which the support of these powerful interests would be given; that Mr. Roosevelt had promptly refused to give any pledges; and that the interests in question had thereupon sought (but in vain) to induce Mr. Hanna to become a candidate, and by various agencies had undertaken to spread abroad an impression that the President had lost his popularity, was regarded with distrust and fear, and could not be elected in 1904.—Governor Odell has reorganized the Republican Committee of the city of New York without the assistance of Senator Platt. It is announced by the newspaper that for some years has represented the Senator that there now remains "not a vestige" of his leadership, and that the ascendancy of the Governor is disastrous to the party. The same newspaper (the *Sun*) is now engaged in a bitter controversy with the Governor, owing, apparently, to the fact that he pardoned a man convicted of libel in connection with a strike in the office of the newspaper a few years ago.—At a meeting attended by about 400 members, the Union League of New York, on the 10th, adopted the report and resolutions of its Committee on Political Reform concerning negro suffrage in the South. The resolutions request the Government, by means of its District Attorneys in the States where an illegal suppression of votes is alleged, to prosecute every case where there has been a viola-

tion of the laws of the United States relating to the suffrage; they also urge Congress to make a thorough investigation and to reduce in due proportion the representation, in the House, of any State where votes have been suppressed by a limitation of the franchise.—United States Marshal Simmons, of Alabama, has resigned because, he says to the President, “the statement made by your referee shows that the line is drawn in favor of the negro and the door of hope is closed to the self-respecting white man.”—At last week’s municipal elections in Massachusetts the Socialists suffered a reverse, losing their two Mayors, both of whom were candidates for re-election. In Brockton the vote was as follows: Keith, Republican, 3,947; Coulter, Socialist, 3,542; Meade, Democrat, 1,116. There was no Democratic candidate in Haverhill, where the Republican nominee defeated Mayor Flanders by a majority of 372.—In a report to Governor Dole, the commander of the Hawaiian militia asserts that General McArthur in conversation recently predicted a war with Germany in the immediate future, saying that the principal scene of hostilities would be in the Pacific. General McArthur denies that he made such a prediction.

Washington Topics

Altho there was no perceptible recess before the beginning of the regular session of Congress, because the extraordinary session continued up to the time when the regular session opened, the President was advised that there had been a constructive recess, and he sent in again, as recess appointments, the nominations of General Wood, 167 officers of lower rank, and Collector Crum. Legal and parliamentary authorities at the capital differ on this point, as to which the decision of Comptroller Tracewell concerning the officers’ pay will probably be final.—In the Senate, Mr. Gorman, while calling for a thorough investigation of the postal frauds by a special committee, asserted that the Republicans desired to stifle inquiry because officers higher than those indicted were guilty and had been allowed to escape. In reply it was pointed out that Congress had investigated Machen and Beavers twice and given

them a clean bill of health.—Two of the indicted postal employees, Thomas W. McGregor and C. E. Upton, were convicted, in Baltimore last week, of conspiracy to defraud the Government. Each was sentenced to be imprisoned for two years and to pay a fine of \$1,000. Mr. Tyner, the indicted law officer of the Department, has sent to the President and given to the press a long letter, complaining that the latter, deceived (he says) by false statements in the Bristow report, has publicly condemned him before trial. He denies what he calls the “unwarranted statement” of the President that “the gross corruption in the case of Tyner has gone on for a number of years.” As a result of the publication of the Bristow report, O. E. Jones, a prominent Republican, has asked the Chautauqua County (N. Y.) Bar to make an investigation, alleging that the postal report asserts that a nephew of Supreme Court Justice W. B. Hooker (formerly member of Congress) was paid \$600 for service in the Fredonia post office, he being then at school in another town; that one Frank P. Ball drew from the same office \$2,532 for service not performed; that John A. Link, a barber, while working at his trade, received \$3,100 from the Dunkirk post office for service not rendered; and that the rent paid by the Dunkirk post office for quarters in a building owned by prominent members of the bar was unjustly increased from \$450 to \$2,000 upon a new lease for ten years.—The House has passed a resolution directing the Judiciary Committee to inquire as to the charges against District Judge Swayne, of Florida, whose impeachment has been demanded by the Legislature of that State.—Representative Gibson, of Tennessee, has introduced a resolution authorizing and advising the President to negotiate with the maritime Powers for a reduction of naval armaments by mutual agreement. On the other hand, Representative Wiley, of Alabama, has introduced the bill of Capt. Richmond P. Hobson (the hero of the “Merrimac”) appropriating the modest sum of \$2,500,000,000 for the navy, the allowance to be increased annually by \$10,000,000 until \$150,000,000 is reached, in 1915, and then to be continued at that rate for ten years.

Colombia and
the Canal

General Rafael Reyes, Colombia's Special Envoy now in Washington, has retained ex-Attorney-General Wayne MacVeagh to assist and represent him in asking our Government to submit to The Hague Court the question whether the United States has a right to prevent Colombian troops from attempting the subjugation of the Isthmus. It may be that the request will relate to other questions involved. General Reyes thinks, it is said, the President's remarks about arbitration and The Hague Court in his recent message should move him to look with favor upon the proposition which Mr. MacVeagh is to make. On the other hand, it is predicted that our Government will say that it cannot be a party to any controversy between Colombia and Panama, but will continue, under the treaty of 1846, to protect the freedom of transit, and will hold that such protection involves the exclusion of Colombian troops from the territory of the new Republic. General Reyes has been plainly told that the United States intends, under the new treaty, to maintain the independence of Panama against any hostile force; that Colombian troops will not be permitted to cross the boundary or land on either coast, and that if Colombian soldiers do succeed in entering Panama territory, they will be ejected. In his messages to Bogota he has shown how hopeless his mission is. He has been elected President. The National Electoral Committee of Colombia refused, last week, to accept his withdrawal from the field, and proclaimed him to be their unanimous choice for that office, with General Gonzales Valencia as Vice-President.—It was reported from La Guayra (Venezuela) on the 9th that 1,100 Colombian soldiers from Cartagena had landed at the mouth of the Atrato River (just below the southern boundary of Panama) and had set out to open a path across the mountains, hoping to surmount the range and then to make their way down the Balsar River to a point on the Pacific Coast about 100 miles south of Panama City. On the 11th it was ascertained, however, that these Colombians were the 450 soldiers who were deported from Colon to Cartagena

on November 5th, two days after the revolt. It is true that they were carried from Cartagena to the mouth of the Atrato and instructed to make a road in the direction of Panama, but after four days of hardship and suffering, having lost their provisions, they gave up the task and returned to Cartagena. This movement was made in disobedience to the instructions of General Reyes, who had directed that no hostile step be taken at present. These instructions were effective with respect to 4,000 soldiers who started from Bogota to reach the coast by way of the Magdalena River, but were recalled after two or three days' travel. Our cruisers and gunboats have been on scout duty along both coasts, to prevent invasion. Several regiments of troops have been held in readiness to be sent to the Isthmus, but it is thought that the marines will need no assistance. A considerable number of them have gone into camp at an elevated point on the railway near Panama, partly for their health and partly because of the moral effect of their presence there. Minister Bunau-Varilla laughed when he was told that Colombian soldiers had started to make a path from the Atrato River. They could not advance more than one mile per day, he said, in the jungle. At the southern end of the Republic's territory there are Indians whom Colombia has never subdued. Invited to confer with the Junta, their chiefs have promised to prevent the passage of Colombians through the tract which they have held for several generations.—The Colombian Senate Committee's report upon the bill to authorize Marroquin to make a new treaty, transmitted by Minister Beaupré, is regarded by our Government as additional proof that delay was sought in order that the concession might be reclaimed and a demand made upon the United States for the \$40,000,000 which the canal company is to receive. This report, which was adopted, held that, as the treaty had been rejected, the company no longer had a right to sell, but must finish the canal; also, that the franchise would expire in October next, when the Republic "will become the owner without cost and can make more advantageous terms." This program

involved a repudiation of the extension granted to the company.—Delegates to a Constitutional convention are to be elected in Panama on the 28th inst., and the convention will be held on January 15th.

The Question in Congress

In the Senate Mr. Hoar has introduced a very comprehensive resolution

of inquiry, asking the President whether, at the time of the ratification of the treaty on the Isthmus, Panama had established its independence, lawfully adopted a Constitution, and given due authority to those who negotiated and ratified; whether the officers negotiating or ratifying had any personal or private interest in the construction of the canal; whether Colombia was prevented by United States officers from attempting to assert its authority and prevent the secession; what instructions were given to our naval or civil officers; what the character of Panama's population is, and its capacity for self-government; when our Government received information of the revolution; whether any information was received of any expected revolution before it occurred, etc. He said that there was nothing in the resolution that would not be welcomed by the President, who desired the public to have full information. No action upon it is to be taken until after the 16th. Some think the Senator's purpose is not friendly. Senator Morgan, denouncing what he called "the Presidential usurpation," reported that "a great Democrat" (his further description pointing to Mr. Richard Olney) had said to him: "For the first time in my life I have to confess that I am ashamed of the attitude of my country." In the House, Mr. Hitt explained the action of the President, defending it against Democratic criticism. Mr. Williams defined the position of the Democratic party, which, he said, did not condone or excuse the action of the Government, was not proud of that action, but wanted a canal and had sense enough to recognize an accomplished fact, no matter how vilely and horribly it had been accomplished. William I. Buchanan, of Buffalo, has been appointed Minister to Panama on Special Mission. Mr. Buchanan (then a Democrat and a resident

of Iowa) was Minister to Argentina from 1894 to 1900. He then became Director-General of the Pan-American Exposition. His business interests, he says, will permit him to act as Minister to the Isthmus for only a short time.

Isle of Pines and Guantanamo

Ratification of the treaty that cedes to Cuba the

Isle of Pines has been delayed not only by the opposition of Senator Penrose, but also by the resolution of Mr. Crumpacker, in the House, instructing the Judiciary Committee to inquire whether the President and the Senate have power, without the approval of the House, thus to dispose of the island. It appears that there was an understanding that Cuba would satisfy the demands of American settlers on the island; and the Cuban House has already passed a bill providing for a local court and the local registration of deeds. The Cuban Cabinet has also ordered the establishment of a subsidized English school and of a custom house at the island's chief port. Further action in this direction will probably cause a speedy ratification of the treaty.—The battle ships "Kearsarge," "Alabama," "Illinois" and "Massachusetts" recently arrived at Guantanamo Bay, and Admiral Barker formally took possession of the site of the new naval station. The United States has acquired about 30 square miles of land and water—a tract having a sea front of seven or eight miles, bisected by the broad entrance channel, and extending inland for nearly four and one-half miles, so that it includes the entire bay except the shallow northern part. This naval station will be one of great strategic importance. Its cable and telegraph connections are already all that could be desired. Within a few weeks a railroad will be in operation northward to Concepcion. This will be prolonged to Nipe Bay and will also be connected with the new main line from Havana to Santiago. It is the intention of our Government to expend several millions upon this new naval base. As about a year must elapse before it will be ready for a garrison, the four companies of American artillery still remaining in Cuba will soon be brought back to the States.

The Philippine Islands

General Wood proclaimed in the Moro Province, on the 11th, the anti-slavery law enacted in October last. The Sultan and the dattos having promised to obey it, General Wood suggests that the natives be placed upon lands assigned to them by their own leaders, and at a rate of valuation that will give the Sultan and dattos a moderate income in the form of rents.—The *Manila Cable News* asserts that the recent uprising at Jolo was caused by the burial of the body of a murderous fanatic by our soldiers in the same grave with a butchered pig. No greater insult, it is explained, could be offered to the Mohammedan Moros. A *juramentado* (a fanatic who has sworn to kill Christians in order that his family may be released from slavery) inflicted mortal wounds upon a cavalryman, and was shot, the bullet that ended his life also killing the chief bugler of the regiment. By the order of the commander, it is asserted, the fanatic was buried in a grave outside the city walls. A pig was suspended over the grave by a derrick, the animal's throat was cut in plain sight of the natives, and after three or four hours, the carcase was buried with the body of the *juramentado*, while the grave was guarded by soldiers. This enraged the Moros, it is said, and they became aggressive. Therefore it became necessary to attack and subdue them.—By the coast survey now in progress it has been ascertained that the archipelago contains 3,000 islands, 1,700 of which bear names.—Beekman Winthrop, assistant executive secretary of the Commission, and recently a candidate for Commissioner, has been appointed a judge of the Court of First Instance.—The Commission recommends that the navigation laws be not applied to the islands until a sufficient number of American vessels ask for such action. Very few such vessels are now employed either among the islands or between the islands and the States.

Latin American Affairs

The reports that President Diaz, of Mexico, is about to resign, altho denied at Mexico City, still keep in circulation, and it is generally believed that he will lay down his office some time before the expiration of his present term of office

on December 1st, 1904. Not only his age lends belief to this, but the fact that he desires to make a tour of Europe. There is a bill now before the Mexican Congress to adopt a constitutional amendment creating the office of a Vice-President, and if this passes, as it undoubtedly will, the first incumbent of the office will doubtless be the successor of President Diaz. The only two candidates who have any real strength—and they seem about evenly matched—are J. V. Limantour, Minister of Finance, and General Reyes, a military hero of Indian extraction.—In Santo Domingo peace but not quiet prevails. Some of the outlying districts are still in an anarchic state, and Minister Powell does not want the "Newport" to leave yet. There are still rumors that some of the defeated leaders of Santo Domingo are sounding our Government as whether in return for a United States protectorate over Santo Domingo our Government will help put these leaders back in power.—Venezuela and Spain are at odds because President Castro obliged the Venezuelan arbitrator, who had agreed with the Mexican arbitrator that Mexico's award should be \$40,000, to withdraw his decision. Thereupon the Spanish umpire sided with Mexico, and instantly he was made the target of such Venezuelan abuse that he was forced to leave the country. Spain thereupon withdrew the exequaturs of all Venezuelan Consuls in Spain, and thus the matter hangs.—It is reported from Washington that, thanks to Minister Bowen's mediation, Venezuela and Colombia are likely soon to renew diplomatic relations. These, it will be remembered, were severed at the time of the revolutions in Colombia and Venezuela a few years ago, when each republic charged the other with instigating the insurrection.

Bebel and Bulow

Herr Bebel, the Socialist leader and member of the Reichstag, last week took occasion of the discussion of the Budget estimates to deliver a bitter criticism on the Russian Government, such as is quite unusual in legislative assemblies and which much startled his hearers. He declared that the German police had put themselves at the service of the Russian police for suppressing political discontent, so that the Russian police acted in

Prussia as if they were at home. Dozens of them, he said, were in Berlin and elsewhere spying on Russian students or residents. "Russia," he declared, "is essentially a barbarous state, against whose bestialities none of the European governments have made protest." Herr Bebel then alluded to Kishineff, where, he said, the authorities "stood by and watched murders;" asserted that a Russian general had driven thousands of Chinese into the Amoor River, and said the arrest of a Russian spy at Sofia had resulted in finding among his papers "documentary proofs that Russia was privy to the plan to assassinate King Alexander months before the event occurred." Herr Bebel severely attacked German policy also. The Government, he said, ought to use moral pressure to prevent difficulties in the Far East, where Russia could easily seize Kiao-chau. The increased naval expenses were attacked by him, and he said that if the Government was determined to build new squadrons the burden should not be put on the poor, but on the rich, and that \$75,000,000 could easily be obtained from inheritance taxes. He did not like the imperial reception to Cornelius Vanderbilt, nor the spectacular presents of statues, etc., to foreign nations, all of which were a sign of weakness rather than of strength. Herr Bebel's followers were stirred to great enthusiasm, but the reply of Prime Minister von Bülow was received with equal acclamation by the Ministerialists. As to Mr. Vanderbilt, he said that the courtesies to him were in return for courtesies to Germans in America. He bantered Bebel, telling him that his ideals would work only in Plato's Republic, where all were angels, "and what an angel," he said, "you would be!" Monarchies, he declared, did more for the people than do republics, and he adduced the social legislation in Germany, such as had been defeated in Switzerland.

Eastern Europe

The new Italian Government, under Signor Giolitti, does not find its path easy. The resignation of his predecessor, Signor Zanardelli, was necessitated by his age and expected from the ill success of his administration, but was perhaps hastened by the

failure of the Czar to visit Rome. It is reported that the Czar was not at all satisfied that his person would be protected against anarchist attacks. The financial position of Italy becomes more favorable, and a surplus of \$20,000,000 is reported, following a short succession of small surpluses, which go to reduce the debt slowly; but the taxes are very heavy, and the expense for the army and navy is so great that little is left for other needs. Signor Giolitti has found difficulty in filling his cabinet, as the strong Social Democratic Party of the Extreme Left refuse to become members of it, except on the condition that the military budget be nearly wiped out. Their opposition may wreck his Government.—The wearisome obstruction in the Hungarian Diet has come to an end by an agreement between Count Tisza, the Hungarian Premier, and Francis Kossuth, leader of the Independence Party. Obstruction will now cease, and a crisis of the utmost severity will end.

Consular Trouble at Alexandretta

Startling news has come from Alexandretta, 140 miles north of Beirût on the Mediterranean Sea, of trouble between the Turkish officers and the American Consul, William R. Davis, from Ohio. It is reported that Consul Davis was escorting an American citizen of Turkish birth, named Attarian, on board the steamship in the harbor, when they were attacked by Turkish police, and Mr. Attarian was taken from him and imprisoned. Thereupon Consul Davis pulled down his American flag and left for Beirût, his life being in danger. It must be remembered that while natives of Turkey, mostly Armenians or Syrians, have come in considerable numbers to this country and been naturalized here, their return to their native country to visit their friends or for the purposes of trade is not welcomed, and the Turkish Government exercises the right to expel them. This seems to have been done in the case of Mr. Attarian. It is not likely that this event will produce any international complications, altho it will give rise to demands for reparation, if the case is as represented. The Turkish side of the story seems to be that, on his return to Alexandretta from

a visit to his native city, Harpût, Mr. Attarian asked the assistance of Consul Davis that he might embark for Egypt. Mr. Davis so informed the authorities, who insisted that the consent of the Governor must be first obtained and the man be photographed. Mr. Davis would not tolerate the delay, and attempted to embark Mr. Attarian, when the police interfered and arrested him at the quay. This led to a fight, when Mr. Davis and his officers struck the police and attempted to enter the guard house to rescue the prisoner, breaking windows and doors, but without success. Mr. Davis threatened that if Mr. Attarian were not released within four hours he would himself leave, and he did so on the very vessel on which Mr. Attarian was to embark. The American ships of war are still at Beirût, and are not likely to leave while this new complication is unsettled. It will be remembered that the chief demand which our Government has made of Turkey, for the same permission to carry on schools as is allowed to England, France, Germany and Russia, has not yet been granted.

Threatened Armenian Revolt

The Armenians in Russia are in a state of unrest very nearly as dangerous to peace as that in Turkey, since the edict confiscating their ecclesiastical property for Government administration. There is so much fear of a general revolt that troops have been hurriedly sent to the Caucasus, and police chiefs have been replaced by military officers, while seizures of arms have been made at Baku, and special precautions have been taken to guard the main railway. While the Czar's decree of June 12 is the chief occasion of the trouble, it would be a mistake to suppose that this is all. It is the "general policy of Russification" which has evoked a strong Armenian reaction. Pacific, civilizing and neutral institutions, such as schools, libraries, benefit societies and charities, are persecuted simply because they are Armenian. The fact that the workmen have been able to organize strikes over so wide an area has inspired other sections of the population with the belief that they also may be able to act in defiance of the authorities. The strikes were based

on the economic requirements of a certain section of the working class. The decree of June 12 affects the interests of the entire population. Formerly the people themselves, by the agency of men in whom they had confidence, managed the property of the churches. The greater part of the revenues were employed to maintain educational and charitable institutions. It was only the smaller part which served to pay the clergy, and the priest considered himself as employed by and as being at the service of his flock. Now, on the contrary, it is proposed to make the priest a State official and the obedient servant of the Czar. Against this policy the people unanimously protest, and the clergy, yielding to the popular pressure, are taking an active part in the movement of resistance. The Social Democratic League of the Caucasus, affiliated to the Social Democratic party of Russia, is taking an active part in defending the Armenian Church. Accounts to hand from Tiflis, Batum, Poti and other populous centers represent the state of Armenian feeling in several areas in the Caucasus as one of extreme tension. In Tiflis itself Armenian proclamations of a highly seditious character have been discovered in considerable numbers, even in the principal streets.

Russia and Japan

The important event of the week in the diplomatic struggle between Russia and Japan has been the unanimous adoption by the Japanese Diet of a resolution condemning the apparent slowness or apathy of the Government in its resistance to the Russian aggressions in Manchuria, and the immediate dissolution thereupon of the Diet. The action of the Diet was extraordinary and unprecedented, inasmuch as it was taken not on a statement from the Cabinet, but on the simple opening address of the Emperor. It was known that there was great dissatisfaction, and that there had been a coming together of parties for pressure upon the Cabinet, which has succeeded entirely in keeping secret the details of the negotiations with Russia. An effort has since been made to show that this drastic action of the Diet was not taken with full consciousness of its import, but was hastily put through in a sort of daze, at the bidding of the

President of the Chamber, who had prepared the resolution. But the interim before the new Diet will meet in April gives the Cabinet a free hand to carry on the negotiations without interruption. It will be remembered that a vote of want of confidence does not in Japan, as in Great Britain, carry with it the overthrow of the Government, inasmuch as the Cabinet is responsible to the Emperor and not to Parliament. Prime Minister Katsura has received the imperial mandate to carry on the negotiations to a conclusion. A reply to the Japanese proposals has at last been received at Tokio, but what it is has not been made known. It was composed after a long conference of Count Lamsdorff, Minister of Foreign Affairs, with the Czar. It is supposed that it concedes somewhat, and invites further discussion, thus not being final. It still looks as if the conclusion will be, as intimated long ago, the permanent Russian occupation of Manchuria, and controlling Japanese influence in Korea. The Russian protest against Korea's opening Yungampho as a free port on the Yalu, opposite Manchuria, has not been withdrawn, and it excites much remark, as Russia does not deny that Korea is still an independent Power and has the right to open whatever of her ports she pleases. But doubtless such opening would be an injury to Manchurian trade across the river. While negotiations are going on for peace, preparations for war are diligently made. The Japanese war ships are reported engaged in evolutions and firing practice, and both fleets have been painted black, which is their war color. One fact not generally understood, that makes for a wise and safe conclusion of the negotiations, is the influence of the four surviving veteran creators of Japan, who have no official position and want none, but who are consulted by the Cabinet on every important point. These men are Marquis Ito, Marquis Yamagata, Count Inoue and Count Matsukata. No Cabinet can work independently of them or hope to ignore them and survive. They represent the intellect and resourcefulness which have made Japan what she is, and their influence is paramount in the State's councils. The men now in chief responsible control within the Cabinet

are Count Katsura, Baron Komura, General Teranchi and Baron Sone, and the four veterans stand behind them.

The Position of Tibet

It is not wholly easy to understand what lies behind the advance of the British force under Colonel Younghusband into Tibet, but it is likely that it is not all a matter of trade. There was a report last year that Russia had attempted to negotiate a treaty with China, which would have deprived China of all her suzerain rights in Tibet, and that this failed through the opposition of Great Britain. It must be remembered that while the local authorities in Tibet have control of local government, all diplomatic and military matters have belonged to the suzerain Power, which is represented by the Chinese Ambans, or plenipotentiaries, who reside in Lhasa. But it is now reported that, failing to make terms with China, Russia has entered into direct negotiations with Tibet, ignoring the rights of China, and that accordingly China has hurriedly recalled her plenipotentiaries. This would be tantamount to a declaration of Tibetan independence, but under the probable protection and virtual suzerainty of Russia. This could not be agreeable to Great Britain, as it would open the way for Russia to advance on India, and it would explain why we hear nothing of any treating of Colonel Younghusband with the Chinese authorities, but only with Tibet. The trade of Tibet is wholly with China, and Tibet has had no good will for the British Government in India. This is not strange if we recall one despicable fact. In 1892, at the time of the former negotiations, one of the Tibetan commissioners who was assisting Mr. Hart was grossly insulted. He was pulled from his sedan chair carried by coolies, and dragged by his heels along the road to the police station. Englishmen were the authors of this outrage, and it was with difficulty that an apology was extracted from them. The Tibetan envoy retired in dudgeon to his own country and took no further part in the negotiations. The memory of such an insult is not easily lost, and it is not strange that Tibetans displayed no alacrity in meeting the mission at Kambajong, to which they were invited,

The Greatness of Herbert Spencer

BY FRANKLIN H. GIDDINGS, LL.D.

PROFESSOR OF SOCIOLOGY IN COLUMBIA UNIVERSITY

THERE is no surer mark of human greatness than the inability of a great man's contemporaries to define his genius and to say wherein his supremacy consists. The mountain of three thousand feet stands clearly outlined in the morning sun. There is no mistaking its features. Every crag and buttress is distinct. The high lights and the shadows of its broken surface are as sharply defined as if traced with pencil point. But who knows the mountain that lifts above the clouds? It stands vague in the distance, and the traveler does not even guess its height. No explorer's foot can find a vantage point from which all its mighty walls can be seen in one comprehensive view. Linger- ing on its loftier peaks, the eye fails to measure the spaces that divide them, or to estimate the depths to the mazes of gorge and valley below. The mists that forever gather and dissolve about its slopes soften their lights and shadows into baffling and commingling mysteries, which no vision ever wholly fathoms.

Of no modern thinker have so many or so various estimates been offered to the world as of Herbert Spencer. By his disciples he has been described as the greatest intellect since Aristotle. By his traducers he has been characterized as a purveyor of pretentious explanations of the universe that already have passed into the shadow-world of bygone philosophies. One class of readers has found his pages charged with inspira- tion; another class has resented his or- derly exposition as mechanical and re- pellent. His very personality, as revealed in his philosophical system, has been con- ceived by some among his critics as com- monplace, unrelieved by any touch of genial sympathy or illuminating humor; and by others as heroic in its straight- forward devotion to one single aim. These are the extremes of estimate. Be- tween them lies every imaginable shade of superficial impression and of critical

appreciation. No human being of two generations, intelligent enough to know anything of the great issues of modern thought, has been wholly unmoved by the magnitude and power of this com- manding mind. Measured by the range of its influence, it stands alone among the intellects of modern times. The sum- mit that is seen from all distances and that baffles and deceives upon the nearer view is presumably loftier than others; it is broader based and more mysterious in its structure.

From the beginning of his philosoph- ical career Mr. Spencer surveyed all fields of physical theory and of biological investigation, and all psychological, so- ciological and moral problems. His first important pamphlet, on "The Proper Sphere of Government," soon expanded into the radical volume on "Social Stat- ics," offered a carefully constructed theory of human happiness. The first edition of "The Principles of Psychol- ogy," published in 1855, four years be- fore Darwin's "Origin of Species" ap- peared, clearly presented a conception of life and of mind as a continuing adapta- tion of organic and nervous changes to environing conditions, and outlined the hypothesis of evolution in most of its essential features. The essays that fol- lowed, including the famous papers on "Progress: Its Law and Cause," and "The Social Organism," contained in brief and striking presentation the sub- stance of the doctrine afterward sys- tematically set forth in exhaustive detail in the ten large volumes of the "Syn- thetic Philosophy."

These volumes challenged the criticism of specialists in every department of ab- stract thought and of scientific research. The "First Principles" raised all pos- sible questions of metaphysics and of physics. The "Biology," the "Psychol- ogy" and the "Sociology" put before the students of those great subjects con- structive systems that must stand or fall

by the verdict of men devoting their lives to detailed research in the wide fields of morphology and of physiology, of psycho-physics and of analytical psychology, of ethnography, culture history, economics and political science. The "Ethics," in like manner, offered a philosophy of human conduct that must take its place as a permanent contribution, if at all, only when it had withstood the assaults of intuitionists and idealists, of utilitarians of the baser sort, and of hedonists of every degree of sublimation. That one man should have the audacity in these days of specialization to grapple with so great a variety of scientific problems, the most difficult that the inquiring intellect can raise, was a mark of either sublime ignorance of the task undertaken, or of amazing insight into fundamental principles that could be relied on to guide safely through the intricacies of phenomenal detail. The charlatan that essays such a labor is quickly exposed in all his intellectual nakedness. That Mr. Spencer avoided errors of detail, or always of construction, no admiring student in any one of the sciences from which the "Synthetic Philosophy" drew its materials would claim. But, when all destructive criticisms have been made, this astonishing fact remains, that it is impossible to-day for the specialist in physics, in biology, in psychology, in sociology, or in ethics to offer any new hypothesis or constructive doctrine without directly or indirectly defining its relation to the philosophy of Herbert Spencer. It is this fact that justifies the comparison of Spencer to Aristotle. For, in the whole history of human thought, these two men alone have so presented and interpreted the knowledge of their time that all other thinkers must of necessity take a position of antagonism to these masters or of agreement with them.

This fact alone would be a sufficient proof of pre-eminent greatness, but there is more to be said. An original mind must be judged by those positions that are in advance of his time at the moment when he takes them. Mr. Spencer's reputation in his later years undoubtedly suffered because of the shortness of human memories. A thousand examples could be marshaled, some of them humiliating and ridiculous, of men justly distinguished for their scientific attain-

ments, who have criticised Mr. Spencer's work on the basis of ideas that, all unconsciously, they had absorbed from him. The whole philosophy of evolution has become so much the very warp and woof of human thought that we find it difficult to realize that in 1850 not more than half a dozen men in all Europe and America had so much as an inkling of its most fundamental ideas, and that of those one only grasped them in a constructive spirit, and saw that they held the interpretation not merely of organic changes, but even of the unfolding of the universe, from star dust to the highest achievements of socially organized mankind. Within the space of thirty years Mr. Spencer by his marvelous constructive power, and his not less marvelous gift of intelligible exposition, had made this conception so familiar to all men that since 1880 all men have imagined that mankind has always thought in terms of it, forgetting to whom they owed their enlightenment. Such an achievement would have been impossible but for one further element in the extraordinary combination of qualifications exhibited in Mr. Spencer's intellectual equipment. To his constructive power and his gift of luminous exposition was added an extraordinary knowledge of concrete facts. Admitting that he has probably said some things about man and the universe that are not true, it must at the same time be said that probably no other man has lived on this planet who has known so many true things about the universe as Mr. Spencer did.

The most unfair criticism of Mr. Spencer's work at any time put forth was the assertion, often repeated, that specialists in each branch of knowledge covered by the "Synthetic Philosophy" regarded Mr. Spencer as a great contributor to each science except his own. The biologists, it was said, held him to be a great psychologist and a great sociologist, but not a trustworthy guide in biology. In like manner the psychologists, we were told, quoted Spencer as an authority in biology and in sociology, but were unwilling to follow him in their own field; while the sociologists never tired of quoting from his biology and his psychology, but could not agree to accept his "Principles of Sociology."

It would take no exhaustive search

through the pages of modern scientific works in any of these branches to discover that this ill-natured criticism is as wide as possible of the mark. In matters of detail any scientific treatise in these days must quickly become obsolete, but a great interpretive principle endures. And there is neither biologist nor psychologist of any standing who does not gratefully acknowledge that Mr. Spencer has contributed to his science certain principles of interpretation that will stand as enduring factors of all future research and exposition. As for sociology, I may not venture to speak for sociologists in general, but expressing my individual opinion, I do not hesitate to say that Mr. Spencer should be regarded as the true founder of a scientific sociology, and as its greatest constructive thinker.

To go into all the reasons for this judgment would require many pages, but two or three of them may very briefly be suggested. The first, of course, is that Mr. Spencer, viewing the phenomena of social change and organization, like all things else in the world, from the point of view of evolution, saw, as no one before him had seen, the relative insignificance of the schemes of politicians, the cure-all formulas of dogmatic reformers, and even the catastrophic upheavals of revolutionary movements. He saw that the evolutionary process in society, as in plant and animal life, takes the form of a continuing adaptation of organism to environment, and that in human history the essential phase of the adaptation is a molding of human character to the relatively permanent circumstances of collective life. This one part of Mr. Spencer's philosophy has received less consideration than his conclusions on various other subjects, and yet it is second to nothing else in his writings in scientific significance or in practical importance. In his first book, "Social Statics," he cut loose once for all from the old conceptions of human nature as unchanging. He had grasped at the very beginning of his philosophical activity the truth that conduct and character were not created but have been developed, and that the developmental process has been an interplay of the living moral agent with the external conditions to which his life is adjusted. It was from this ger-

minial thought that the whole Spencerian philosophy of evolution sprang. It contained by implication the famous definition of life as a correspondence of internal changes to external changes, and the doctrine of the survival of the fit. The "Synthetic Philosophy," indeed, might truthfully be described as a work which traced this thought, originally derived from a study of manners and morals, back to first principles of physical correlation, and then, retracing the steps, built up a synthetic doctrine of life, of mind, of society, and crowned the whole with a re-examination of ethics, conceived as a doctrine of the improvability of human nature.

A second reason awarding the highest rank to Mr. Spencer's "Principles of Sociology" is found in the insight with which he detected the dominant causes of social character. We never find him making the mistake of presenting the forms of social organization as of primary importance. They are themselves a result of social character. Golden conduct does not spring from leaden instincts, and instincts are created or modified by habitual activities. If these are aggressive and cruel—because the environment is one in which only the aggressively cruel are "the fit" that can survive—the social character and the institutions are a mixture of authority, obedience and arbitrariness. If activities are predominantly tolerant, peaceful and industrial—because the environment is one in which men can live without preying upon another—the social character and the institutions are spontaneous and liberal. Mr. Spencer's theory of social causation is thus neither purely psychological nor purely physiographic. It is rather a theory of the correlations of subjective states with external circumstances; of social systems conceived as products of a human nature that is itself molded by the physical conditions of existence. It has a wider sweep than the political theories of such earlier writers as Hobbes and Rousseau, or of such "economic interpretations of history" as have more recently been in favor.

A third reason, and the last that I shall name, for assigning pre-eminence to Spencer's sociological views lies in precisely that fact which nearly every one

of his adverse critics has cited as a proof of incoherence, or even inconsistency, in his system. Mr. Spencer's political doctrine is an extreme individualism. It is alleged that long before he had grasped the principle of evolution he had accepted the political creed of Bentham and Mill, and was thenceforth unable to see that the social integration which he pictured as an evolutionist is inconsistent with that extreme of individual liberty which he had set up as an ideal in "Social Statics." This criticism betrays such an incomprehensible failure to grasp the most essential part of Spencer's conception of evolution that it is little short of reprehensible. Throughout his system Mr. Spencer distinguishes between simple and compound evolution. Simple evolution is little more than that integration or concentration of units which may be seen, for example, in the contraction of a cooling mass of once molten metal whose molecules are drawing together. There is no life, no progress, in evolution of this sort. These higher phenomena come only when integration, without being arrested, is hindered and is complicated by differentiation. Not to go further into the abstractions of this subject, it is enough to say that Mr. Spencer has shown with the utmost clearness that the highest types of social organization and achievement, to say nothing of the finer things of individual life, are not possible in a community where all other interests are sacrificed to the "integration" of a military or socialistic solidarity. They are possible only where there is a sufficient integration—maintained not by force but by the spontaneous

agreements that occur to human natures of a high type—to insure co-operation, leaving the utmost freedom to the individual social unit to further develop his intellectual and moral nature by activities not inconsistent with that general good which his own reason and conscience reveal to him. The more carefully Mr. Spencer's sociological and political writings are studied in the light of the great generalizations set forth in the "First Principles" and in the "Psychology," the more clearly will it be seen that an ideal type of liberalism, rather than any mode of authoritative centralization, is the only social system that can realize all the highest potentialities of the evolutionary process.

An appreciation of Mr. Spencer's greatness would be altogether inadequate and misleading if no word were said of the character that was even greater than the intellect. In his unswerving devotion to his ideals Mr. Spencer was the living exponent of his own conceptions of human nature at its best. His hatred of injustice and of impurity was relentless. He cared nothing for the distinctions for which most men strive, and, despite the impression that he sometimes left upon men that did not know him well, and who mistook the physical limitations of an invalid for inherent traits of character, he had a rich endowment of sympathy and kindness, and a profoundly reverent nature. Whatever may be the final estimate of his philosophical system, his character, as one of the few great leaders in the ranks of intellect who have lived as they have taught, will not grow less dim in the on-moving years.

NEW YORK CITY.

Herbert Spencer: The Man

BY WILLIAM HENRY HUDSON

[No one living is better qualified to write of Herbert Spencer than Professor Hudson, his intimate friend and private secretary for many years. Professor Hudson, before he lived with Mr. Spencer, was a London journalist and lecturer on English literature for the London Society for the Extension of University Teaching. After he left Mr. Spencer he came to this country and became assistant librarian at Cornell University and later Professor of English Literature at Leland Stanford, Jr., University. At the time of the Ross incident, however, he could not adhere to the course of the university and resigned with several other of the professors, who sympathized with Professor Ross. Since then he has been at work in England. Besides a number of books on purely literary subjects, he is the author of "Introduction to the Philosophy of Herbert Spencer."

—EDITOR.]

THE life of Herbert Spencer, written in detail, must be substantially the record of intellectual development and achievement; its few external events of any importance may be set down in a very brief summary. Born in Derby, England, on the 27th day of April, 1820, the future philosopher sprang from a stock marked by great integrity and independence, and thus came honestly to his own well-known mental and moral characteristics. He obtained his early training under the care, first, of his father, a teacher by profession, tho vastly in advance of the current educational theories of his time, and later, of his uncle, the Rev. Thomas Spencer, a clergyman of the English Church, broad in theology, and energetic in various lines of social reform. Judged by the common standard—that of the amount of knowledge accumulated—Spencer's education would hardly be pronounced a success; estimated from the standpoint of growth in power and personality, it would probably be difficult to overstate its value. Despite the hope entertained for a while by his uncle, himself a Cambridge wrangler, the youth did not read for either of the great English universities, but after a brief experiment in teaching took up civil engineering as a profession, for which he seemed to be fitted. and one which, in those early days of railway excitement, promised a brilliant career. He was then about seventeen. For some eight or ten years he devoted himself, tho in a rather intermittent way, to his chosen work, which, however, he presently abandoned as, with the subsidence of the mania, he came to realize

that the field was seriously overcrowded. Thus, at twenty-six, he had to cast about him for a fresh start. Spencer's, it will be noted, was not one of those cases in which a man seizes firmly and at the outset the work which is destined to absorb the best energies of his life. All that he had as yet done distinctly foreshadowing his later labors, had been done incidentally, in some "Letters on the Proper Sphere of Government," which, originally issued in a newspaper in 1842, and afterward republished, are especially significant now as containing the first expression of his individualism.

The fresh start, when at length made, was as sub-editor of the *Economist* newspaper, in London. This position, which he held from 1848 to 1853, whatever its drawbacks, had the advantage of yielding him a considerable margin of time for independent work; and that he turned this to good account was shown when, in 1850, he brought out his "Social Statics," a volume of extraordinary originality and power, and one of the most thoroughly readable of all his writings. The way for this had been prepared, not only by the "Letters" just mentioned, but also by the study and thought of many years, during which he had expressed what was then known as the Development Hypothesis, and adopted from Lamarck the general theory of the adaptation of organisms to environment by the transmission of acquired characters. Stress may here be laid on the fact that Spencer's line of approach to systematic philosophy was, as his first volume shows, the line of practical interest; and as he began with ethical and social questions, so through-

out all his vast subsequent speculations, remote from daily life as they might often appear to be, the human bearing of his inquiries was never lost sight of. The principles of personal and social well-being represented the final purpose of his life-work, and to the establishment of these, as he himself stated, he regarded all other parts of it as subsidiary.

"Social Statics," however, brought Spencer to a clear sense of the innumerable problems which start up on every

side in connection with the questions he had there attempted to answer. The results presented thus proved to be the starting points of fresh investigation. For some years, feeling his way now in this direction and now in that, he busied himself mainly with the production of a number of masterly essays on various aspects of the development theory. In these, and in the first edition of the "Principles of Psychology" (1855), we can follow the gradual unfolding and

HERBERT SPENCER

consolidation of his thought, and they, therefore, still form an admirable introduction to the great system, for which, indeed, they were so many preliminary studies. The conception of this System first definitely emerged in Spencer's mind in 1858, and in March, 1860, he issued a detailed prospectus of the entire "Synthetic Philosophy." He counted upon twenty years for the completion of his plan. Begun in 1860 and ended in 1896, it actually occupied him for thirty-six years.

As an example of sustained intellectual power hardly matched in history, and as a contribution of deep and far-reaching influence to the thought of the age, the series of volumes comprising the Synthetic System may be left to speak for themselves. But there is a personal and moral side to this astonishing achievement upon which it is worth while to dwell; for even those who care nothing about philosophy should bear in mind the conditions under which the gigantic enterprise was commenced, and the difficulties through which it was pushed painfully forward to its close. I say nothing now of financial impediments, the scanty encouragement offered at first by even the cultured world, the constant misrepresentations of adverse critics, the interruptions entailed by work, explanatory or original, which from time to time the author found it necessary to undertake outside the main design. These things counted much against him; but they counted infinitely less than his own state of seriously impaired health. The "Synthetic Philosophy" alone contains some 6,000 closely printed pages, every one of which is compact of substantial thought; and surely this would have been no meager output by a robust man, in complete command of his working powers. But several years before the first line of "First Principles" was written Spencer had suffered a nervous break down, from which he never recovered; and as years went by he little by little sank into a condition of practical invalidism. From the beginning, he had not dared to anticipate more than three hours a day of regular work; as a matter of fact, he was often compelled to content himself with the dictation of a paragraph or two of a morning, and again and again, some-

times for weeks or months at a stretch, to seek recuperation in absolute rest. More than once, indeed, in the frequently recurring periods of utter physical exhaustion, there seemed nothing for him but to throw down the pen in despair. Yet still he persevered, tho for many years convinced that he was merely fighting for a forlorn hope. Viewed simply, therefore, as so much work actually done in the teeth of obstacles which might well have broken the stoutest courage, the "Synthetic Philosophy" could not easily be paralleled in literary annals; it stands as the mighty monument of a brave man's steady endurance and single-hearted devotion to his life's ideal. That at last the end should have been reached surprised Spencer himself as much as it did any of his friends. I remember that when, the first time I saw him after the concluding volume had been issued, I spoke some words of congratulation, he answered in a tone I shall never forget: "Yes, I am satisfied—I am satisfied!"

I think I am justified in saying that Spencer's personality rarely made a favorable impression upon strangers. Knowing him intimately as I did, I have to depend in this matter mainly upon the opinions of others; yet I can quite understand the difficulty which many seem to have experienced in getting into touch with him under the conditions of casual intercourse. He was a reserved man; his manner, save toward personal friends, was habitually cold and distant; there was nothing about him to set the chance comer—especially if he happened to be of the all-too-common lion-hunting order—at his ease. And even his friends had to make occasional and sometimes large allowance for the irritability which was an inevitable result of constant insomnia, dyspepsia and nervous prostration. After all, his heroic struggle to fulfil the purpose of his life told in many ways upon him, for it involved sacrifices, which in turn brought about some narrowing of personal interests and sympathies; while the fact that he never married, and lost most of his immediate relatives early in life, undoubtedly led him to dwell over-much within himself. But to emphasize a certain austerity which marked him in his more formal associations without at once adding that this was in reality only

the superficial aspect of a singularly strong, upright and noble nature would be to give an altogether false idea of the man. Absolute rectitude seems to me to have been the keynote of his character. Throughout his life, in small things as in great, he governed his conduct according to the most stringent principles of justice and right; and if his severe sense of what was due from others made him occasionally seem over-exacting—if in his judgments of men's motives and actions he might sometimes appear to take ordinary human weaknesses too little into account, he at all events claimed from other people not a whit more than he demanded of himself. And of the rest, if I may draw upon the memory of my own long relationship with him, he was a man whom intellectually and morally one might admire at a distance, but whom one grew to revere and love as one came to know more and more of him. The real emotional richness of his nature, his transparent simplicity and freshness, the depth of his sympathy and kindness, were not opened to the general world, and revealed themselves only at close touch. For all his reserve, for all his hatred of publicity, he was not by temperament a recluse. Ill-health and the urgent need of economizing his strength alone kept him out of many social activities he would otherwise have enjoyed. As it was, he was devoted to his friends; was fond of the genial intercourse of the dinner table; and delighted in story and repartee. For a good many years, until indeed his nervous trouble assumed its more serious form, when he was well on toward seventy, he was a regular *habitué* of the Athenæum Club, where he played a capital game of billiards (sometimes, I recollect, with a bishop for antagonist). And tho always a rather impatient reader of general literature, he was a passionate lover of music, which, during the years when I saw most of him, seemed to yield him his greatest solace and pleasure.

It would, of course, be absurd to attempt in a few sentences either to give any outline of Spencer's philosophic system or to offer criticism upon it; but a word may be ventured concerning his place in the history of the modern doctrine of evolution. In the minds of probably the large majority of people even

to-day that doctrine is still identified almost entirely with the name of Darwin, whose "Origin of Species" is thus commonly regarded out of perspective. Now, it would be simply impossible to exaggerate the depth and reach of the influence exerted by Darwin's investigations and conclusions. None the less, it is needful to insist that such investigations and conclusions really lay in certain narrowly defined fields, and were of a highly special character; and that what is called Darwinism is by no means synonymous or co-extensive with the theory of evolution at large. In brief, Darwin was primarily a biologist, and takes his place as one of the world's epoch-makers in virtue of the fact that it was he who first definitely set forth and established the great principle of natural selection, or, as Spencer afterward termed it, the survival of the fittest in the struggle of existence. Spencer, on the other hand, conceived evolution as a universal process, and built his philosophy upon that conception; biological evolution being thus for him only one aspect of the general cosmic problem. Furthermore, it must be borne in mind that his System had been thought out in detail before the first publication of the researches of Darwin and Wallace in 1858. As far back as 1850 he had touched the theory of higher human evolution in "Social Statics"; in 1852 he was already warmly defending the Development Hypothesis against adherents of Special Creation; in 1854, in "The Genesis of Science," and the following year in "The Principles of Psychology," he dealt with mental phenomena from the evolutionary point of view, and in 1857 he published a general (tho, as he afterward saw, an incomplete) formula of evolution, organic and super-organic, in his remarkable essay on "Progress: Its Law and Cause." The mere mention of these titles suffices to show Spencer's entire independence of the great scientist, who is too often ignorantly spoken of as his master.

Spencer's philosophy, then, is, in a word, the philosophy of evolution; its object is to exhibit the life-history of the cosmos as a complex result of a universal process, the fundamental laws of which are first established and traced down to their ultimate explanation in terms of the

constant and necessary redistribution of matter and motion. The plan pursued by the author is from this point perfectly clear. To begin with, he had, in "First Principles," to formulate, inductively and deductively, the universal truths which were to furnish a basis for his proposed complete unification of knowledge. This done, he had then to carry such universal truths forward into the particular phenomena of life and mind, society and morality; two volumes on Biology, two on Psychology, three on Sociology, and two on Ethics (making, with "First Principles," ten volumes in all), embracing the entire scheme. How much or how little of this vast edifice is likely to

stand the test of time and criticism, is a question which must not here be considered. But it is surely safe to prophesy that, come what may, Spencer's name will rank high among those of the immortals. The impulse given by him to workers in almost every field of thought and investigation testifies to the immense range and rare originality of his genius; and his "Synthetic Philosophy" itself, no matter in what way it may hereafter be modified or outgrown, will unquestionably be regarded by future generations not only as one of the grandest achievements of the century which brought it to birth, but also as a permanent landmark in the history of civilization.

LONDON, ENGLAND.

New England

BY JOHN G. WHITTIER

[This poem was originally published in the *New England Review*, October 18, 1830, while its author was editing that paper. Two other poems by Whittier appear in the same number, both with his signature, while this was anonymous. The probable reason for this is the self-assertion of the last stanza, and perhaps the rather warlike tone of the first. When he published "Moll Pitcher," two years later, this poem formed part of it, with the omission of the concluding lines. A row of asterisks took their place. As he never allowed "Moll Pitcher" to be included in any collection of his works, these lines will not be familiar to most of our readers. The last stanza was copied in his biography.—S. T. PICKARD.]

*Land of the forest and the rock—
 Of dark blue lake, and mighty river—
 Of mountains reared aloft to mock
 The storm's career—the lightning's shock,—
 My own green land forever!
 Land of the beautiful and brave—
 The freeman's home—the martyr's grave—
 The nursery of giant men,
 Whose deeds have linked with every glen,
 And every hill and every stream,
 The romance of some warrior dream!—
 Oh, never may a son of thine,
 Where'er his wandering steps incline,
 Forget the sky that bent above
 His childhood like a dream of love—
 The stream beneath the green hill flowing—
 The broad-armed trees above it growing—
 The clear breeze through the foliage blowing;—
 Or, hear unmoved, the taunt of scorn
 Breathed o'er the brave New England born;—*

Or mark the stranger's jaguar hand
 Disturb the ashes of thy dead—
 The buried glory of a land
 Whose soil with noble blood is red,
 And sanctified in every part,
 Nor feel resentment, like a brand,
 Unsheathing from his fiery heart!

Oh—greener hills may catch the sun
 Beneath the glorious heaven of France,
 And streams, rejoicing as they run
 Like life beneath the day-beams glance,
 May wander where the orange-bough
 With golden fruit is bending low;—
 And there may bend a brighter sky
 O'er green and classic Italy—
 And pillared fane and ancient grave
 Bear record of another time,
 And over shaft and architrave
 The green luxuriant ivy climb;—
 And far towards the rising sun
 The palm may shake its leaves on high,
 Where flowers are opening, one by one,
 Like stars upon the twilight sky,
 And breezes soft as sighs of love
 Above the rich mimosa stray,
 And through the Brahmin's sacred grove
 A thousand bright-hued pinions play!—
 Yet, unto thee, New England, still
 Thy wandering sons shall stretch their arms,
 And thy rude chart of rock and hill
 Seem dearer than the land of palms!
 Thy massy oak and mountain pine
 More welcome than the banyan's shade,
 And every free, blue stream of thine
 Seem richer than the golden bed
 Of Oriental waves, which glow
 And sparkle with the wealth below!

Land of my fathers!—if my name,
 Now humble, and unwed to fame,
 Hereafter burn upon the lip,
 As one of those which may not die,
 Linked in eternal fellowship
 With visions pure and strong and high—
 If the wild dreams which quicken now
 The throbbing pulse of heart and brow,
 Hereafter take a real form,
 Like specters changed to beings warm;
 And over temples worn and gray
 The star-like crown of glory shine,—
 Thine be the bard's undying lay,
 The murmur of his praise be thine!

Contents

The Year's Holiday Books

The Work of John S. Sargent, R.A. With an Introductory Note by Mr. Meynell. Limited edition. Illustrated with sixty reproductions in photogravure of Sargent's finest paintings. Scribner's. \$30.00 net. Edition de luxe, \$100.00 net.

Miniature Painters, British and Foreign. With some account of those who practiced in America in the eighteenth century. By J. J. Foster. Illustrated by many reproductions of famous miniatures. Author's edition, \$35.00 net. Edition royal, \$350.00 net.

Hans Holbein the Younger. By Gerald S. Davis, M.A. With thirty photogravure plates and eighty colotype illustrations. Limited edition; cloth and vellum back. \$35.00 net.

World's Children. By Mortimer Menpes. Text by Dorothy Menpes. Elaborately illustrated with reproductions in color of children of many nations. Macmillan. \$6.00.

The Art of the Pitti Palace. With a short history of the Building of the Palace, a History of its Owners and an Appreciation of its Treasures. By Julia de Wolf Addison. Illustrated. Rubricated title-page. Page, Boston. \$2.00.

Eighty Drawings, Including the Weaker Sex, the Story of a Susceptible Bachelor. By C. D. Gibson. Scribner's. \$4.00.

The History of American Sculpture. By Lorado Taft. With twelve full-page photogravures and one hundred and four illustrations in the text. Macmillan. \$6.00 net.

The Art Portfolio of the International Studio. Lane. \$5.00.

The Art Album of the International Studio. Containing a collection of one hundred representative plates from John Lane's Magazine of Arts and Crafts, *The International Studio*. Title-page tinted and gilded. Many of the illustrations in color. \$5.00.

The Genius of J. M. W. Turner. Special Winter Number of *The Studio*. Several of the Turner pictures reproduced in color. Lane. \$2.00 net.

Letters from a Farmer in Pennsylvania to the Inhabitants of the British Colonies. By John Dickinson. Illustrated. With an Historical Introduction by R. T. H. Halsey. Edition limited to 260 copies on Van Gelder hand-made paper and 39 copies on Imperial Japan paper. The Outlook Company. \$7.50.

The Book of the Courtier. By Count Baldesar Castiglione. Illustrated from the Italian by Leonard Eckstein Opdycke. With twelve portraits and fifteen autographs. Scribner's. \$4.00.

In Arcady. By Hamilton Wright Mable. Illustrated by Will H. Low. Decorative marginalia by Charles L. Hinton. Dodd, Mead. \$1.80.

Backgrounds of Literature. By Hamilton Wright Mable. Illustrated with drawings and photographs. Rubricated title-page. The Outlook Co. \$2.00.

An English Village. A new edition of *Wild Life in a Southern Country*. By Richard Jefferies. With twenty-five pictures of nature and rural life, made in Wiltshire, by Clifton Johnson, and an Introduction by Hamilton W. Mable. Title-page in tints. Little, Brown. \$2.00.

The Forest. By Stewart Edward White. Illustrated by Thomas Fogarty. The Outlook Co. \$1.50 net.

The Magic Forest: A Modern Fairy Tale. By Stewart Edward White. Illustrations in color and in black-and-white by C. E. Hooper and J. M. Gleason. Frontispiece in tint. Macmillan. \$1.50.

The Book of Months. By E. F. Benson. Title-page in green tint. Marginalia in color. Harper's. \$2.50.

Poems. By Dante Gabriel Rossetti. With illustrations from his own designs. Edited by Elisabeth Luther Cary. Rubricated title-page. Illustrations in tinted photogravure. Two volumes. Putnam's. \$6.50.

The Courtship of Miles Standish. By Henry Wadsworth Longfellow. With illustrations by Howard Chandler Christy. Frontispiece and some other illustrations in color. Bobbs-Merrill. \$3.00.

The Hunting of the Snark; and Other Poems and Verses. By Lewis Carroll. Illustrated by Peter Newell. Frontispiece in colors. Harper's. \$3.00.

When Malindy Sings. By Paul Laurence Dunbar. Illustrated with Photographs by the Hampton Institute Camera Club. Marginal decorations in tint by Margaret Armstrong. Dodd, Mead. \$1.50.

Songs from the Hearts of Women. By Nicholas Smith. McClurg. \$1.40.

Christmas Songs and Easter Carols. By Phillips Brooks. Title-page rubricated and pictorial. Engraved initial letters. Dutton. \$1.00 net.

Poems of Tennyson. Chosen, edited and with an introduction by Henry Van Dyke. Ginn. \$1.50.

In Beauty's Realm. Handsomely illustrated. By C. Allan Gilbert. Fox, Duffield & Co. \$4.00.

Reflections of the Morning After. Written and illustrated by Herman Lee Meader. Engraved frontispiece and marginalia in tint. Binding in Persian cloth. H. M. Caldwell Co. Boston. 75c.

From "Following the Deer."
By William J. Long. Ginn & Co.

Months and Moods. A Fifteen-Year Calendar. Versified and Diversified. By Edward Curtis. Rubricated title-page. Deckle edge paper. The Grafton Press.

Love Bits. By Elsie Elizabeth Johnson and Mary Rebecca Leonard. Lavender Binding. The Reed Publishing Co., Denver, Col.

Men and Women. By Robert Browning. With Many Drawings by Henry Ospovat. Rubricated title-page and chapter headings. Dutton. \$2.50.

Marriage in Epigram: Stings, Flings, Facts and Fancies from the Thought of Ages. Compiled by Frederick W. Morton. McClurg. 80 cents.

The Heart of Hyacinth. By Onoto Watanna. Frontispiece in colors. Marginal decorations by Kiyokichi Sano. Harper's. \$2.00.

Castle, Knight and Troubadour. In an Apology and Three Tableaux. By Elia W. Peattie. Illustrated. Hand-made paper. The Blue Sky Press, Chicago. \$2.00.

Romance of the Bourbon Chateaux. By Elizabeth W. Champney. Frontispiece in colors. Copiously illustrated. Putnam's. \$3.00.

The Cathedrals of Northern France. By Francis Miltoun. With eighty Illustrations, Plans and Diagrams by Blanche McManus. Page. \$1.60 net.

The High History of the Holy Graal. Translated from the Old French by Sebastian Evans. LL.D. With decorative drawings by Jessie M. King. Dutton. \$3.50.

The Dutch and Quaker Colonies in America. By John Fiske. Illustrated by portraits, maps, fac-similes, contemporary views, prints and other historical materials. Two volumes. Houghton, Mifflin. \$8.00.

Stately Homes in America from Colonial Times to the Present Day. By Harry W. Desmond and Herbert Croly. Illustrated with one hundred and fifty full-page views. Rubricated title-page. Appleton. \$7.50 net.

Two Centuries of Costume in America. By Alice Morse Earle. Illustrated from photographs collected by the author. Rubricated title page. Two volumes. Macmillan. \$5.00.

Egypt. Painted and described by R. Talbot Kelly. Illustrated in color. Macmillan. \$6.00.

Thoughts for Every-Day Living. From the spoken and written words of Maltbie Davenport Babcock. Frontispiece in photogravure. Binding in limp leather. Scribner's. \$2.00.

Friendship. By Hugh Black, M.A. With an in-

troductory note by W. Robertson Nicoll, D.D. Frontispiece and Borders Throughout in Tint. Revell. \$1.50 net.

Among the Great Masters of the Drama: Scenes in the Life of Famous Actors. Thirty-two reproductions of famous pictures, with text. By Walter Rowlands. Rubricated title-page. Dana Estes. \$1.20.

The Love Affairs of Great Musicians. By Rupert Hughes. Frontispiece in photogravure. Two volumes. L. C. Page. \$3.20.

Little Journeys to the Homes of English Authors. By Elbert Hubbard. Title-page in red line. Illustrations in photogravure and copper plate. Morris, Browning, Tennyson, Macaulay, Byron, Addison, Burns, Milton, Johnson, Southey, Coleridge, Disraeli. Putnam's. \$2.50.

Little Journeys to the Homes of Great Musicians. By Elbert Hubbard. Title-page in red line. Illustrations in photogravure. Mozart, Brahms, Mendelssohn, Wagner, Handel, Chopin, Liszt, Verdi, Paganini, Schumann, Bach, Beethoven. Putnam's. \$2.50.

Famous Actors and Actresses in Their Homes. By Gustav Kobbé. With numerous illustrations, in tint, from photographs. Little, Brown. \$3.00 net.

Cruising in the Caribbean with a Camera. By Anson Phelps Stokes. Illustrated. Dodd, Mead. \$2.00.

Angel's Wickedness: A True Story. By Marie Corelli. Walter R. Beers. 75 cents.

Boston: The Place and the People. By M. A. De Wolfe Howe. Illustrated by Louis A. Holman. Frontispiece in tint. Macmillan. \$2.50.

The Complete Poetical Works of Adelaide Anne Proctor. With an Introduction by Charles Dickens. Rubricated title-page. Frontispiece in photogravure. Crowell. \$2.00.

In Argolis. By George Horton. With introductory note by Dr. Eben Alexander, late United States Minister to Greece. Illustrated from original photographs. Tinted frontispiece. Illustrations in soft brown. McClurg. \$1.73.

The City of the King: What the Child Jesus Saw and Heard. By Mrs. Lew Wallace. With illustrations. Bobbs-Merrill. \$1.25.

The Pilgrim's Progress. By John Bunyan. Thirty-one illustrations in Puritan costume by Harold Copping. Revell. \$1.50 net.

The Book of Italian Travel. (1580 to 1900.) By H. Neville Maugham. Binding in limp leather. Dutton. \$3.00 net.

Hill Towns of Italy. By Egerton R. Williams, Jr. Illustrations from photographs. Houghton, Mifflin. \$3.00.

In the Palaces of the Sultan. By Anna Bowman Dodd. Illustrations in black-and-white and in photogravure. Dodd, Mead. \$4.00.

Over the Border. By Robert Barr. With colored frontispiece by Frank T. Merrill. Stokes. \$1.50.

The Mark. By Aquila Kempster. Illustrated in color by H. H. Foley. Doubleday, Page. \$1.50.

The holiday offering of books this season includes a number of very elaborate specimens of book making. There seems to be a decided tendency toward the use of color in illustration. This tendency is reflected in the color plates reproduced in the present number of THE INDEPENDENT. The three-color process, while as yet by no means perfect, has, nevertheless, reached a stage where many excellent results are obtained. The popularity of the photogravure process in illustration where color seems undesirable continues.

HAL.

Specimen illustration from "The Call of the Wild," by Mr. Jack London, reproduced by permission of the publishers, The Macmillan Company.

In the following notices a selection has necessarily been made from the best of holiday books. While the omission from this list does not necessarily signify a lack of merit on the part of a book not reviewed, nevertheless, we feel confident that the books hereafter noticed are all more or less meritorious:

Perhaps the most conspicuous art book of the year is Mrs. Meynell's volume on *The Work of John S. Sargent*. This book has been long in preparation, but now that it is published its delayed appearance justifies the time spent upon it. Its pictures constitute a striking gallery of celebrities as well as a series of modern masterpieces of the art of which Mr. Sargent is probably the most famous living exponent. The volume includes the recently executed portrait of President Roosevelt, the late Henry G. Marquand, Mrs. Marquand, Mrs. Endicott and Joseph Jefferson. The illustrations in photogravure show this art in its highest perfection. The volume is superb.

Another of the finest of the holiday art books in folio size is *Miniature Painters, British and Foreign, with Some Account of Those Who Practiced in America in the Eighteenth Century*. A number of beautiful miniatures from celebrated collections appear in the pages of the two volumes of this book, one of which, a miniature of the youthful Napoleon, is reproduced herewith.

Still another grand folio volume is *Hans Holbein, the Younger*, which contains many magnificent examples of this justly celebrated artist's work. Henry VIII and many of his wives and contemporaries live in this book's pages because of Holbein.

In *World's Children* there is a pictorial

treat. An even hundred pictures of children has been gathered from the four quarters of the globe. Children of all sorts and conditions have been painted by Mortimer Menpes, and then reproduced in color in this book under his own superintendence. The result has been, eminently satisfactory. The picturesque naturally has been given prominence, but the racial characteristics of the children have been preserved, and the English type, for example, could never be mistaken for the French or German or any other. The same is true in other cases. The black and white reproduction of the Russian girl that accompanies this article loses much because it is acromatic. The illustration as printed in the book shows a color combination that could only originate in Russia.

Among art books, *The Art of the Vatican* of last year is followed this season by *The Art of the Pitti Palace*. There is no gallery of its size in the world so replete with gems of art and acknowledged masterpieces of the Golden Age of painting in Italy as the Pitti Palace. The growth of the collection here and the various halls in which the art treasures are displayed have been described and to some extent illustrated.

A Christmas holiday season without a Gibson book would seem like peaches without cream. This year it is called *Eighty Drawings, including The Weaker Sex, The Story of a Susceptible Bachelor*. Through the pages of this book the ever popular Gibson girl trips lightly and otherwise disports herself to the edification of those who look upon her as drawn by the only Gibson.

A Gibson conceit entitled "A Happy Faculty" follows: Young Tutter (to

Uniform of Colonial Officer. From
"Two Centuries of Costume."
(Earle.) Macmillan Co.

hostess): "I have had a very pleasant evening. But, then, I always manage to enjoy myself, no matter where I am."

A very desirable contribution to the history of American art is made in *The History of American Sculpture*, which inaugurates a series of books which are intended to cover the graphic, the plastic, the illustrative, the architectural, the musical and the dramatic arts. Many illustrations embellish the book and make the text more effective than could otherwise be the case. Sculpture is a noble art and has long waited for such a historian as is Mr. Taft.

The Art Portfolio of the International Studio contains a selection of fifteen of the choicest color and photogravure plates from the parts of the *International Studio*. These are mounted on card mats, ready for framing, if desired. In *The Studio Art Album* appears a somewhat similar collection of one hundred of the finest plates, both black and white and in color, from the parts of the *International Studio*.

The special winter number of *The Studio* is devoted to *The Genius of J. M. W. Turner*. From various sources a representative selection of the drawings, paintings and engravings of this artist have been assembled and the reproductions show the work of the great master in all the different periods of his artistic career. The accompanying text is comprehensive and very complete.

Letters from a Farmer in Pennsylvania is one of the most satisfactory examples of this season's book making. The letters themselves have been reproduced from the *Pennsylvania Chronicle and Universal Advertiser*, of 1767. They have been arranged and introduced by

Mr. Halsey, from whose hands we have also had the magnificent volume, *Pictures of Early New York on Dark Blue Staffordshire Pottery*. The letters are valuable contributions to history. The daintiness of their get-up will commend them to book lovers. The paper is deckle edged, the letterpress has beautifully wide margins, and even the jacket is ornamented with a most effective gold line that follows the front and back edges of the volume. Its very simplicity gives it individuality. The book was printed at the Gillis Press.

The Youthful Napoleon. From "Miniature Painters, British and Foreign." (Foster.) Dutton & Co.

The Book of the Courtier, which was issued some time ago in more elaborate form, is now published with less expensive plates and binding, so that the book will be found available by those interested in the old Italian ideals concerning the Courtier as set forth in the text, but who do not feel able to buy limited editions.

Hamilton W. Mabie's *Under the Trees* of last year is followed this season by *In Arcady*. The theme in both these is the same, but the

stimulation of Nature, the joys of the woods, the fields, the very roadsides, in the various moods of an enthusiast, to whom such things strongly appeal, is freshly set forth. Another subject with which Mr. Mabie has concerned himself is *Backgrounds of Literature*. In his easy, graceful style he has described Wordsworth and the Lake Country, Concord and Emerson, the Washington Irving Country, and other interesting backgrounds.

An English Village is a new edition of *Wild Life in a Southern County*, by Richard Jefferies. It is probably the most attractive of Jefferies's works for

American readers. Nothing, perhaps, that is more charming or more faithful to reality has been written of the English country. Mr. Mabie again writes a pleasant introduction.

Stewart Edward White is another man who has got near to nature's heart in *The Forest*. His point of view is not the same as Mr. Mabie's, but he feels the inspiration of the woods, the camp, the canoe, the river, the hills, and, quite as strongly perhaps, the catching of certain fish. *The Magic Forest*, by the same author, is a modern fairy story with wood motifs, and delightful color plates. One of these is reproduced in this issue.

The Book of Months differs from the books just mentioned not a little, but it is charged with something of philosophy and much of charm, notwithstanding its English setting and environment. There is many an unobtrusive lesson for Americans in this book. The author has delightfully caught the spirit of the changing year and the sequence of the months.

Following her former studies of Tennyson, Browning William Morris and the Rossettis, Miss Elisabeth Luther Cary contributes a book on the *Poems by Dante Gabriel Rossetti*, in two volumes, as her share of the holiday offerings of books. The present book has been made uniform with those previously issued by Miss Cary, and it is marked with the painstaking care and judicious selection of material that is characteristic of this writer, who is becoming more prominent every day in the literary world.

Christy's illustrations are features in the Bobbs-Merrill version of *The Courtship of Miles Standish*. Forty-two drawings by this artist, some of which are in color, are introduced, and the volume becomes in consequence most attractive. The old story takes on added interest because of the illustrations, and the book is a typical holiday publication. Priscilla and John Alden, as

exemplified in the pages of this publication, will appeal to hundreds of people as a new audience through the medium of Christy's fancies.

Peter Newell follows his illustration of *Through the Looking-Glass and What Alice Found There* of last year with a similar treatment of Lewis Carroll's *The Hunting of the Snark and Other Poems*. The art of Peter Newell is unlike the art of any one else. He appeals to children, it seems, in an especial manner, and there is more joy on their part over Newell's quaint illustrations than is the case with the pictures from the hands of ninety-nine out of one hundred illustrators. The binding of the book is in white vellum.

Under the inspiration of Paul Laurence Dunbar, the negro takes on more of romance than would perhaps be the case if there were no Dunbar. In *When Malindy Sings* we have some new verses of his, the reading of which cannot but be made exceedingly pleasant, because of the very agreeable illustrations that have been effectively lavished upon the book's pages.

Typical Russian Girl. From "World's Children." (Menpes.)
Macmillan

Another volume in the department of poetry that is pleasing, but which lacks the charm that comes through illustration, is *Songs from the Hearts of Women*. The author has gathered together one hundred famous hymns which have come from the hearts of women. Hence the book's title. It is an interesting holiday contribution to hymnology. Still another volume of verse, illustrated and ornamented, is entitled *Christmas Songs and Easter Carols*. Eight poems by Phillips Brooks are included. The book was printed by D. B. Updike at the Merry-mount Press, Boston.

Poems of Tennyson, chosen and edited with an introduction by Henry Van Dyke, contains a frontispiece in photogravure that reproduces a bust of the Baron D'Eyncourt, by William Ordway Partridge. Other illustrations scattered through the volume are also in photogravure. Dr. Van Dyke, in his introduction, accords Tennyson a place in literature as the most representative poet

of the English speaking world in his own epoch.

A number of poems, some old and some new, have been pleasantly illustrated in the volume which has for its title *In Beauty's Realm*. One of the illustrations from this book is reproduced with this article. It accompanies Robert Herrick's song, as below:

"I dare not ask a kiss,
I dare not beg a smile,
Lest having that, or this,
I might grow proud the while.

"No, no, the utmost share
Of my desire shall be
Only to kiss that air
That lately kissed thee."

The Persian cloth binding used upon *Reflections of the Morning After* is very striking. It is not the only charm of the book by any means, however. It opens with the following bit of verse:

SOCIETY.

"Play a little ping-pong,
Have a little chat,
Make a little chocolate fudge,
Then go find your hat.
Say you've had a jolly time,
As she waves her fan,
Now, isn't that exciting sport
To tempt a healthy man?"

This is fairly indicative of the brightness that characterizes the little book. This is the kind of a book that one would never think of buying, but after it has been purchased you get a lot of fun out of it.

A fifteen-year calendar is a novel and interesting detail in *Months and Moods*. The verse is light, but the calendars would serve to encourage the preservation of the book. *Love Bits*, likewise, belongs in this group. Some prose is included with the verse, but this strengthens rather than weakens the book.

That is a charming edition of *Browning's Men and Women* that has been made available this year, the illustrations of which are by Henry Ospovat. These

Queen Jane Seymour. 1537, Vienna. Painted by Holbein.

"The Mark," by Aquila Kempster.

Published by Doubleday, Page & Co., N. Y.

suggest Aubrey Beardsley, but they seem to harmonize well with the Browning text.

In these latter days when men and women are marrying who never married before a book such as *Marriage in Epigram* will be sure of a welcome. When a sailor goes to sea, if he had no chart and no guide he would be very badly off. Possibly the same would not be quite so true of the benedict who had not a copy of *Marriage in Epigram* in his library, but all the same it is an amusing book and well worth while.

There are not nearly so many Japanese books this year as was the case twelve months ago, but one by Onoto Watanna, in the Japanese series inaugurated by her and entitled *The Heart of Hyacinth*, has to do with a Japanese romance. The atmosphere is Japanese and so is the decoration of the book. Some of the Japanese legends and traditions have been skillfully blended with the text.

A story of the elder gardens of France, of the flowers of chivalry and the rose of song, pleasantly told, is that entitled *Castle, Knight and Troubadour*.

For many years Elizabeth W. Champney has strolled in the enchanted gardens of Versailles and the result has been the gathering of much material that has been tastefully arranged for publication. *Romance of the Bourbon Châteaux* is in a series written by the author of the present volume. An author who writes after seeing with the eyes of an artist writes as Miss Champney does, very charmingly.

In *The Cathedrals of Northern France* the author has divided them into six parts and ten appendices. A wealth of illustration has been made a part of the book. These include Notre Dame de Reims and others more or less famous.

The grand and glorious Cathedrals of Northern France have been considered by the author with more than ordinary enthusiasm, and the result has been to lift the volume somewhat above the domain of a conventional guide book.

The High History of the Holy Graal has been translated from the Old French by Sebastian Evans and illustrated by Jessie M. King. This book will particularly interest all those who love to read of King Arthur and his Knights of the Round Table. The original story of Sir Perceval and the Holy Graal, which is the most holy vessel that is called Graal, wherein the precious blood of the Savior

was received on the day that he was put on rood and crucified in order that he might redeem his people, has been comprehensively set forth without abridgement, as it left the hands of its first author. The adventures of Peraldur and Lancelot, their brother knights, and the troubadours, as well as other related matters, run lightly through the pages of the volume.

More about King

Arthur is contained in *The Story of King Arthur and His Knights*. The hero of this tale was perhaps the most honorable and gentle knight who ever lived in all the world. The noble band with which he was associated consisted of chivalrous fellows, the deeds of all of whom go to make up fascinating stories. The incident of the Sword Excalibur is strikingly retold.

Mr. Scott has gone somewhat afield in his *Theory of Advertising* as holiday books go, but in our day there is so much advertising to be done that it may well be considered in a holiday book. Such a theme can do no harm and may easily do some good. When we remember that the business men of the United States are spending \$600,000,000 a year in

Fille à la Médaille, by L. Lévy-Dhurmer. From "The Art Album of the International Studio." John Lane

printed forms of advertising it becomes interesting to know something of the theory of the art so as to get the desired result. The theory of advertising thus becomes a very desirable gift book. One incidental illustration of what the ideal advertisement should bring about is instanced by the author in his reference to the Dutch tulipomania and its far-reaching influence. If the reading of this book is to bring about the writing of advertisements that shall be business getters to the extent signified by the Dutch mania for tulips, which prevailed during the seventeenth century, no advertiser can do without it, and it may well be included among the gift books. The text is worthy of note even if it should not be found absolutely authoritative.

We have been rather inclined to look askance at the hermit of the story books and to think of such a person somewhat unkindly, but if there be an unreasoning prejudice against hermits as a class, this is swept away when *A Hermit's Wild Friends* reveal the joys that are derivable from eighteen years in the woods. There is much to learn of Nature and her methods that cannot be learned by those

who walk on city streets and who dwell in city houses. The hermit writer advances some unusual theories regarding animal habits, but he is pertinent when he writes "You would better investigate carefully before denying the probability of any one of these claims." Mr. Walton finds that squirrels, mice, bees, crows and other birds all have stories to tell that are full of charm to those *blasé* in the city.

The studies of William J. Long in his *School of the Woods* of last year are continued this season in *Following the Deer* and *A Little Brother to the Bear*. The demand for books in the Nature series continues strong and the Long books have a well deserved popularity. Several of the publishers have found it good policy to issue books of this kind and some new writers on nature study have arisen during the year just closing.

The Call of the Wild has been so much talked about that is only needful to call attention here to the color plate from this book that we reproduce in this issue.

One of the first books to be devoted to the decorative use of flowers is

The Whittier Kitchen. From "Old Paths and Legends of New England." (Abbott.) Putnam's

entitled *The Flower Beautiful*. The importance of harmony in color and form not only between the flowers used, but likewise between their receptacles and surroundings, is pointed out and made the book's theme in a thoroughly practical and very attractive way.

The curious combination of things that it is possible for intelligent girls to do are collected and arranged in the book which has for its title *Three Hundred Things a Bright Girl Can Do*. It would astonish the Puritans and some others to read the chapter headings. Art, fancy work, wood carving, rug making, basketry, pyrography, joinery and a host of other occupations lie open to girls to-day as never before, without mentioning athletics, housewifery and things that are sometimes put down as the destiny of women. The book is academic in style and very helpful and suggestive. It will make an excellent Christmas present for a girl known to be ambitious.

The legends and traditions of New England are particularly interesting and readable as set forth in *Old Paths and Legends of New England*. Lovely nooks and corners of the country have been sought out and pictured in a very charming manner, while the homes of the country, as well as those who made the homes what they have come to signify, have been given a place in this book, all of which makes interesting reading, whether one has or has not lived in the region. One of the New England homes to which pilgrim-

ages are made is the Whittier Home, at Haverhill, Mass. A reproduction of one of the rooms in this historic homestead, which accompanies this article, shows a typical open fire place, spinning wheel, bed warmer, bellows, colonial chairs, candlestick and an old-fashioned rag carpet mat.

Charles M. Skinner, whose former collection of American folk-lore stories was so successful, has now published another book called *American Myths and*

Legends. The charm of the first series continues in the collection he has now made and the holiday season cannot but be brighter and cheerier because of this book than would have been the case without it. The book is dedicated to his friend, Dr. J. H. Hunt.

The Dutch and Quaker Colonies in America, in beautiful holiday edition, will constitute a valued addition to any library. The author's narrative is "minute, accurate and fascinating."

Many of the homes pictured and described in *Stately Homes in*

America are little short of princely in their magnificence. There are two views of the White House and a pictorial collection of less notable but quite as beautiful homes contained in the book. Most of those who read about these houses cannot for various reasons visit them, but any one can read about and enjoy the grouped pictures.

Mrs. Alice Morse Earle has drawn upon her apparently inexhaustible stock of material for another of her pleasing contributions to our knowledge of Co-

Copyright, 1903, Fox, Duffield & Co.

Illustration to Robert Herrick's "Song." From "In Beauty's Realm." (Gilbert.) Fox, Duffield & Co.

lonial times. The title of her last publication is *Two Centuries of Costume in America*. Both costume and art find places in the new Earle book, and there are included numerous reproductions of portraits by famous English and American artists. American costume has hitherto been sadly neglected, but has now for the first time something like adequate treatment. The book merits high praise.

The chief merit of *Egypt, Painted and Described*, lies in its illustrations, which are reproductions of seventy-five water color paintings, made by the author, of typical Egyptian scenes. The accompanying text is slight and makes no pretense to being a serious study of Egypt and its customs. It is pleasantly readable, and, with the pictures, more than accomplishes the writer's stated purpose of conveying to the reader a "little of the fascination of the country." Now that Cairo is beginning to rival St. Augustine as a winter resort, a work such as this, intended to stimulate the interest of the pleasure seeker rather than that of the student, meets a growing want; and as it leads the reader into places well out of the beaten track, by showing him pictorially their beauties, it is better than any guide book which leaves everything to the imagination.

There is something of the religious that cannot be divorced from the holidays. As a tribute to this idea, *Thoughts for Every Day Living* has much to commend it. Churchmen and others will find much solace in the book.

Hugh Black's *Friendship* has been daintily reprinted with borders and chapter headings in tint. It will appeal particularly to Y. M. C. A. young men. The introductory note, by W. Robertson Nicoll, is an appreciative tribute to the author.

Among the Great Masters of the Drama sets forth scenes in the lives of famous actors, and when one has seen the crowds gather about the stage entrance of even a "ten, twent' and thirt'" theater to see the various members of the company leave the building we can better understand the following that the great actors had, which makes them inspiring themes to read about.

The Love Affairs of Great Musicians

upon the general theory that all the world loves a lover will have many readers. The tradition that the path of true love runs not always smooth will have strong confirmation from this book. Those in love and those about to marry may well read the book and gleam encouragement or despair, according to the chapter they may chance to read. Some of the text is in minor key, but that was, of course, to be expected with a book carrying such a title.

There is a galaxy of celebrities that Elbert Hubbard has included in his *Little Journeys to the Homes of English Authors*. When we grow fond of an author we like to know something of his home and his life, which liking has been ministered to in the *Little Journeys*. A very similar theme has been considered in *Little Journeys to the Homes of Great Musicians*. Gustave Kobbé has followed in the footsteps of the Roycrofters in his volume, *Famous Actors and Actresses and Their Homes*. Possibly the interest in this book will be found stronger than that which will be felt in the Hubbard books. The illustrations, in tint, of stage favorites, will appeal to a very large class.

Cruising in the Caribbean with a Camera, under the guidance of Anson Phelps Stokes, will be found an enjoyable pastime. His photographic lens has done good work, and because of it the little booklet that comes from him is delightfully illustrated. Some Porto Rican children, the ex-King of Dahomey and wives, St. Pierre before and after its destruction, washing clothes in Jamaica, and a picture of the "Sea Fox," in which the cruise described was made, are notable among the illustrations.

Marie Corelli has written a new true story for the holidays called *Angel's Wickedness*. It makes 54 printed pages and can be conveniently slipped into a pocket from which it can be easily taken to read.

Boston has sometimes derisively been called "The Hub of the Universe," and many have been found to smile at the city and the inhabitants thereof. In *Boston, The Place and the People*, a serious view of the subject is taken, and the evolution from Colonial Boston to the Boston of today and its modern inheritance is full of

“ A slim, graceful animal slipped from the rock ledge ahead.”

Specimen illustration from “The Magic Forest,” by Mr. Stewart Edward White, reproduced by permission of the publishers, The Macmillan Company.

interest. To be Bostonese signifies culture, even if no eye-glasses are worn. The literary traditions of Boston are inspiring, and if Boston be not actually the literary center of the country it is not far removed from such center, as the book sets forth.

A good edition of Adelaide Procter's poems has been a literary need, which *The Complete Poetical Works of Adelaide Anne Procter*, with introduction by Charles Dickens, in large measure supplies. Dickens's interest in the poet arose through the fact that most of her poems appeared in Dickens's two

A new edition of *The Pilgrim's Progress* this season contains thirty-one illustrations in Puritan costume, by Harold Copping. The allegorical journeyings of Christian are thus given a new and rather artistic flavor that is pleasing, but quite in contrast with the illustrations that accompanied the earlier editions of Bunyan's masterpiece.

Ever since Sterne made his famous journey through Italy there has been a lingering charm about that country. *The Book of Italian Travel* will tend to foster and strengthen this charm, and in its pages there is constant contact with

The Breakers. Residence Mr. Cornelius Vanderbilt, Newport, R. I. From "Stately Homes in America." (Desmond and Croly.) Appleton

periodicals, *Household Words* and *All the Year Round*.

There is a rather comprehensive survey of Modern Greece in the book by George Horton, entitled *In Argolis*. Greece is so far away that not many of us get to see it for ourselves, but the country which once did so much to make the world wiser, better and pleasanter to live in deserves the pleasant treatment it gets at Mr. Horton's hands.

The City of the King deals with the Holy Land. Nazareth, Bethany, the Dead Sea, Bethlehem, Gethsemane and the Pools of Solomon are introduced as very pertinent illustrations.

things Italian from many points of view. The towns of Italy; its cities and their suburbs; the Italian lakes; something of the architecture of the country and a thousand other things lure the reader from page to page. *Hill Towns of Italy* is a narrative of a journey through Central Italy, with visits to the hill towns which will appeal to students of art and history. Some of the charms of Central Italy are emphasized in this book.

The Turkish Sultan has been able to impress himself upon his times in a wonderful manner, and the "Sick Man of the East" will live in history long after he has passed from earth. *In the Palaces*

of the Sultan deals with the Turkish ruler and his people in their homes and at their occupations in such a manner that new light will be shed for most persons upon Turkey and those who are natives of that country, where the crescent and the star are symbolic of power.

A new novel by Robert Barr is entitled *Over the Border*, the colored frontispiece of which we include in this issue.

An illustration from *The Mark*, which is a Hindu mystery novel, full of the glamour and fascination of the East and having to do with native life in India and some of the marvels of Hindu magic of that country, also appears in this issue of THE INDEPENDENT.

A privately printed book on *Gardening*, reprinted from The Strawberry Hill Press, by Louis Buddy, III, which was announced for holiday publication, is well under way. Advance proofs indicate that the volume will be exceedingly well executed. It will be completed shortly after the holidays. Mrs. Alice Morse Earle has written the introduction.

The present season's showing of Christmas cards is notable, as the stock

of these items available at all the larger department stores will serve to indicate. The Scribners, Dodd, Mead & Co. and some of the other booksellers with stationery departments have executed a number of private Christmas and New Year's cards of very taking designs.

Wm. Edgar Fisher, of Fargo, N. D., has just issued a third portfolio of book plates designed by him. Some excellent work in the same line has recently been done by Wilber Macy Stone and Jay Chambers. Hugh M. Eaton and Margaret Fernie Eaton have also designed a number of dainty book plates in color.

Some artistic calendars for 1904 are issued by E. P. Dutton & Co. and G. P. Putnam's Sons.

An exceptionally fine calendar for the same year is The Valhall Calendar, issued by The Valhall Studio, in Brooklyn, N. Y., with specially designed and hand wrought initials, the backgrounds of which are in gold and copper.

The usual European Christmas magazines have colored illustrations inserted. Of these *The Graphic*, *The Sketch*, *Pears' Annual*, *The Illustrated London News* and *The Paris Figaro Illustré* may be mentioned as being particularly good.

Public Libraries: Their Need of Expert Counsel

BY HERBERT PUTNAM

LIBRARIAN OF CONGRESS

THE problems of a public library begin with its constitution. They end, not at all. Shall its administration be committed to a corporation already established and perhaps already maintaining a collection of books, or to a public corporation? If the latter, shall it be a public corporation—*e.g.*, a school board—already in existence, and representing the municipality in the administration of other agencies for education, or a body newly created for the express and sole purpose of establishing and maintaining a public library? If the latter, how shall this new board be constituted, how many members shall it have, shall they be appointed by the mayor (with or without the consent of the City Council), or elected; or, in part, *ex-officio*, representing other educational agencies or self-perpetuating? What shall be their qualifications; to what extent shall they be men of affairs, or men of the learned professions, or men of letters? Must they include representatives of different sections of the city, of different religious faiths, of different political parties, of both sexes? For what term shall they serve? What shall be their powers, what their organization? Shall they have authority to determine—within a stated maximum—the amount of the annual appropriation for the support of the library, or are they to be dependent for this upon the decision each year of the City Council and Board of Estimate? Shall they be granted a lump sum, to be applied within their discretion, or limited to a specific amount for each division of expenditure — building, books, service, etc.?

For the board itself, when created, the immediate problems involve as many options. Is a building to be attempted at once, or should experience of the public need first be secured through a period of

operation in rented rooms? If a building, what sort of a building, in what location? Shall it be placed in the residential or in the business district? What shall be its plan? For what collections and activities shall it provide, for how long a future? Shall it consider the needs of the special investigator as well as those of the general reader; how shall it apportion facilities as between the reference use and "the home use"? How far shall it provide accommodation for newspaper readers, for children; for work with the schools, for study clubs and literary societies, for lectures, for a museum, for an art gallery? What policy shall it assume as to access to the shelves; shall it provide for access to the entire collection, or to a limited portion of the collection, or to no part of it? For what amount of service is it to provide and how distributed? For what administrative needs?

But there may as yet be no funds for a building. How are they to be raised? By the issue of city bonds, by private subscription? If so, in what way is the interest of givers to be aroused? How can they be shown the utilities in the matter, how convinced that a public library adequately housed is not merely an ornament, but a necessity? What is there to be offered as proof, in literature, in the experience of other towns and cities?

If the board is wise it will have a special adviser in the decision of these latter matters, for it will appoint a librarian before considering them. But what manner of a man shall it appoint as librarian? A man of manners, certainly; but shall he be primarily that, or a man of learning?—or a man of business? Must he have had systematic training for library work and practical experience in it, even without knowledge of the particular

community to be served; or should he preferably be a resident, with such knowledge and an adequate general education, but without library training or experience? Must he be a man; or may, or should he be a woman? What shall he be paid? What shall his powers be? How far shall his discretion extend; how far shall it be subject, even in matter of administrative detail, to the action of the board or its committees?

The determination of the building leaves still innumerable and continuing problems, which the wise choice of a librarian will not settle, tho it may aid to settle them wisely. The board will probably have to go to the City Council for an appropriation for maintenance. It must make out a case for the library—a case that will stand against the competition of other public improvements and agencies. What shall be its case? What may it claim as a reasonable percentage of the total sum to be raised for the year by taxation? Shall it be a sum based upon the appropriations for the schools—as compared with other cities having libraries as well as schools—or upon the population, or upon any other definite ratio considered reasonable elsewhere? The sum determined, how shall it be apportioned—as between maintenance proper, equipment and the purchase of books? The board must decide upon the organization of the staff, the method of selection, appointment and dismissal of employees, their qualifications, duties and compensation; the method of selection and purchase of books; the system of classification (the choice is among a myriad—and one more—which the librarian himself will wish to devise) and the system of catalog—whether in book form or solely on cards; whether merely by author or also classed; or, also, or instead, by subject. There is even a choice of policy as to binding, as there will always be—*e.g.*, between buying the expensive stocking and darning it, or the cheap one and throwing it away when the heel has worn through.

What are to be the regulations of use, what the constituency? And how is this to be secured? How far is it to be sought and by what methods? Is the service of the library to be merely or chiefly responsive, or is it to be positive, even aggressive?

All these problems are met by each new library in turn. They are met and in some manner solved. But the solution is by no means uniform, and so far from being perfect, represents thus far only varying degrees of imperfection. How else, when there is no definite standard, or authoritative judgment to appeal to? The great multiplication of free libraries has come within the past thirty years; the great impulse given by Mr. Carnegie's gifts within the past ten years. A gift, or other opportunity arises, a Board of Trustees is created, and they set to work. They are to establish a library; it is to be a free library; there are to be books which the people are to have for nothing; there is to be a librarian. But beyond this their notions are vague. They are not themselves experts. Each has probably an existing library in mind which represents to him a type. He takes it as an example. It should very likely be rather a warning. If the board choose an expert as librarian he may tell them so, but to convince them will be another matter. He may get them to accompany him in an inspection of a number of particular libraries, but the chance is that in each they will get, with the impressions that are useful of things that are pertinent, impressions that will prove inconvenient of things that should have no application to the local conditions with which they are called upon to deal. To choose what is appropriate requires in itself the discrimination of the expert; and they are not experts.

The initial questions settled there is the continuing one of the selection of books. As to none is there at present such an absence of definite principle or of expert control: as to none perhaps is casual or uninformed opinion, or the absence of a consistent policy, more wasteful or more perilous. What shall the library buy—of the twelve million books that have been published since the invention of printing, of the forty or fifty thousand that are issued each year? With means always limited, the choice among the former is difficult enough; but a wise choice among the latter seems almost impossible. The Board of Trustees cannot read them all, nor the librarian. They must depend upon an outside estimate. Where shall they find it? In part in the critical reviews. But the reviewer, even

if competent and well meaning, is considering but one book, and this purely from the scientific or literary standpoint. He has no obligation to determine which is the best among several books of which the library can buy but one; nor has he a knowledge of its existing collection, or of its special constituency. Its problem is not in fact before him, save in the one element; is the book in the abstract worthy or worthless? Then, alas, the critic of current publications is by no means necessarily either competent or well-meaning; he is often capricious, he is apt to be hasty, he is sometimes under control of the publisher—whose business is to sell the book, not to determine whether people ought to read it, still less whether libraries ought to buy it. And he is quite certain to be influenced by the immediate popularity of the book which he is reviewing. Now this, while a good reason for its purchase by an individual, or by a subscription library, is not an adequate reason for its purchase by the municipality out of public funds. The library must look to the positive service which the book is likely to perform, a service not necessarily instructive, of course—certainly not merely austere—a service perhaps only to the taste and not at all to the understanding, but still a positive service. And of this the present popularity of a new book is the slightest test; as little, it may be, as the present popularity of a particular breakfast food. It is the creature of advertisement.

There is an accumulated experience which might be of use. But this is not gathered together at any one place in a custody which has a duty to make it available.* There might be such a judgment. A judgment which library trustees might seek in the decision of a policy and in the choice of a librarian, and to which their librarian might later refer

* In a score of States Commissions have been established whose purpose is to promote the organization of libraries, aid them with counsel and suggestion, and in some regions with a grant of money or books, and to maintain themselves a system of traveling libraries. Within their means and authority these Commissioners render a service of great and growing value. Their field is, however, merely local, and their means and authority are imperfect. They are themselves commonly petitioners to the Legislature for an enlargement of each. Their own scope and function are thus far rather matter of experiment than of principle. And they would themselves gain by an ability to refer to the disinterested judgment of some outside body representing well-informed general opinion.

for advice and in support of his recommendations. There is none at present. Such aid as they can now get will be the aid of particular librarians or trustees, who have no obligation to give it, and who, however willing to advise, can speak with precision only as to the experience of a single institution. There is no advisory body which, with the deliberate purpose of giving advice, has brought together the experience of a number of libraries of various types and can exhibit it in a comparative way; and which, in addition, represents the general consensus of expert opinion in matters of administrative policy and economy.

Little wonder, then, that the public libraries of this country represent so little that is uniform in principle or administration; that buildings are built which are insufficient, ill-arranged and extravagant to administer; that librarians are appointed whose training is yet to be got and at the expense of the community; that apparatus methods and processes are adopted which must later be thrown over; that unworthy books are bought merely because of their popularity, and considerable sums spent in the purchase of books that while in themselves worthy are not the books most suitable for the particular library at that stage of its career—and that in general mere enthusiasm, indispensable, but ill-informed and inconsiderable, takes the place of cool and scientific selection and decision.

There is in the United States a library association. It is composed of librarians and library workers, of trustees of libraries, of persons at large interested in the promotion or improvement of libraries. Its membership is now nearly 1,500, and includes representatives of *all* the active libraries of this country and Canada. It holds annual meetings, at which, for an entire week, reports of particular work are submitted and problems of library administration are discussed. At the meeting most largely attended a thousand persons were registered. The association has, besides an Executive Board, a council, composed of thirty of its more experienced members, representing libraries of various types. No opinion concerning a matter of library administration is promulgated by the association except upon recommendation of this council,

The association maintains a Publishing Board. Through this board it arranges for the compilation and publication of indexes, bibliographies, selected lists of useful books and other aids for the trustee, librarian, teacher or reader. The work of this board has been placed on a permanent footing and is likely to be much enlarged in scope by the gift from Mr. Carnegie last year of \$100,000 to form an endowment.

In addition to the National Association, with its annual conference, there are State associations which meet at more frequent intervals. At these also problems of library economy are discussed and experiences compared. There is thus the material accumulating for a considerable body of doctrine. There is an organization capable of formulating and declaring it. There is not, however, as yet any institution or bureau which, with a continuing existence, may give it expression in application to the problems of a particular library. Suppose that there could be such a one; suppose that at some convenient center, say New York, there could be a bureau under the direction perhaps of the American Library Association itself, with a competent executive and

staff, with an express duty to advise inquirers as to all matters of library organization and administration, and to illustrate by precedent and example the safest and most economical solution of the problems of building, service, and the selection of books—a bureau which should not supplant local enthusiasm, but give it scientific direction, and which should not destroy individuality, but aid it by suggestion as to the field within which it may safely operate. Suppose, I say, such a bureau in existence, with a competent staff, a museum of plans of buildings, library apparatus and “aids,” and with a fund of information and authoritative opinion; a signal advance might be made toward economy and efficiency in our library system, and definite principle substituted for what is now so much a matter of chance or of ill-informed or inexperienced opinion. The establishment of such a bureau is now an ambition of the American Library Association. It might hope to accomplish for American libraries what the Institute of Social Service, just organized, proposes for certain other humane endeavors: “to make the experience of all available for the instruction of each.”

WASHINGTON, D. C.

The Extra Illustration of Books

BY DANIEL M. TREDWELL

AUTHOR OF “A MONOGRAPH ON PRIVATELY ILLUSTRATED BOOKS: A PLEA FOR BIBLIOMANIA,” ETC.

EXTRA illustrating, or, as it is also called private illustrating, as applied to books, is an art that has only come into vogue in this country during the past quarter of a century. Special attention was perhaps more particularly attracted to it by the extra-illustrated books that came before the public in consequence of the Daly sale. There were few if any engaged in the extra illustration of books forty years ago, and fifty-five years ago it is safe to say that there were no practitioners. Perhaps the first enthusiast to undertake extra illustrating was the late John Allen, the well-known book collector of

New York, whose collection was sold in 1864. Contemporaries of his in this fascinating pastime were Mr. Duer, Dr. Koecker, of Philadelphia, and Mr. Morean, of New York. Later workers in extra illustrating have been Dr. Thomas Addis Emmett, Robert Hoe, Jr., Charles C. Jones, of Augusta, Ga., and John P. Woodbury, of Boston, Mass. The writer has been interested in the extra illustrating of books nearly all his life.

The experience I have gained in extra illustrating has been very valuable, though my extra-illustrated books have all been of a very modest character. There have been no large folios or unique editions

among them and no Whatman paper. It never occurred to me in assembling them that I was doing anything more than a purely selfish act, certainly nothing worthy of the least public attention.

Nearly sixty years ago I began to extra illustrate books. By extra illustrate I mean the insertion in a book, of appropriate prints not originally published with the book. My first experience in private illustrating was with Giraud's "Birds of Long Island," a work considered standard so far as its scientific accuracy was concerned. To obtain illustrative material, I dismembered a rare and splendid quarto volume entitled "Natural History of the State of New York," thus enrolling myself as a Grangerite. For this piece of vandalism I have never forgiven myself. I have committed many follies since, but it is some small consolation to think that there are but few orthodox collectors or true bibliophiles who have not, at some time, committed similar offenses. One result which followed my destruction of a very valuable book for the purpose of extra illustrating a comparatively insignificant one, was a considerable knowledge on my part of the science of ornithology thus incidentally acquired. Possibly this was, in part at least, compensation for the mischief done.

I have extra illustrated many books since, and am at present engaged in extra illustrating Dr. Henry R. Stiles's "History of the City of Brooklyn," which I began something like forty years ago. This labor is still unfinished. Every one of my books has been illustrated for the purpose of increasing its usefulness, but not, of course, entirely with reference to artistic structure. Personally, I regard it as most undesirable to extra illustrate a single book with a mixture of engravings and photographs. It seems to me that the most

elegant books are those illustrated throughout in the same style of art.

The searching after portraits and other pertinent material for the extra illustrating of a book is a most engrossing pursuit. To give the layman an idea of what extra illustrating signifies financially, I may say that in extra illustrating the "Life of Edward Everett," a collection of prints numbering seventy-five was made, the total cost of which reached \$25, which is a large sum for one book in this age of paper and cloth covered volumes. In another case, something like five hundred prints were collected by me at an expense of a little less than \$200. Hundreds if not thousands of dollars may easily be spent upon extra illustrating a single volume. A novice had best begin with a simple book, and when experience

Inlaid Portrait of William B. Astor. Engraved on steel by A. H. Ritchie after a picture by Kurtz. The inside line shows the border of the original print (reduced). The outside line marks the dimensions of the print after inlaying. The process is described in the text.

has been gained he may engage himself with something more elaborate.

To reduce the size of a print is a simple process; to expand a small print into one of larger dimensions there is greater difficulty. It is, however, absolutely essential that every print should be brought to a uniform size, when the prints are to be used with the sheets of the book. To accomplish this it is necessary to secure the aid of a professional man—the inlayer—of whom there are but a few in this country worthy of mention. Messrs. Trent, Toedteberg and Lawrence, of Brooklyn, and Poole, of Boston, are, perhaps, the best in this country. The work turned out by these gentlemen is far superior to that of the best English and French inlayers.

The process of inlaying, stated briefly, is as follows: The first essential is the selection of paper of the desired quality and of the size to which the proposed book is to be extended. The leaves of the book as published being necessarily of uniform size, the inlaying of the text pages is, of course, simply a repetition of the operation as many times as there are leaves in the volume. The same is not likely to be the case with the prints, as with them the size is certain to vary more or less. It is also possible that there may be a variation in shape; some may be square, others oblong, round, or oval, while others will be irregular. Thus it will be easily seen that every print requires a special treatment. After the prints have been neatly cut down to the shapes required, the outer edges are beveled, the bevel extending about a quarter of an inch upon the margin of the print; this beveling is accomplished by means of a special knife made for the purpose. An opening is then cut into the mounting sheet, of the same size and shape as the print, with an allowance for a quarter of an inch lap on the inside, which is also beveled so as to conform to the print. These outer edges are then fastened together with paste made of rice flour. Rice paste is considered more desirable because of the fact that it retains its whiteness when dry. The inlaid portraits, when pasted, are placed under gentle pressure until required for use.

It is sometimes necessary to split a sheet which carries pictures upon both

sides. This splitting process is quite interesting and is performed by pasting the sheet to be split between two pieces of stuff, and then tearing them apart. This being accomplished, one-half of the sheet adheres to each of the two pieces of separated stuff. The process, as may readily be supposed, is extremely delicate, but the results secured by experts are surprisingly good.

When the extra illustrated book comes from the hands of the inlayer, built up, extended, inlaid, or cut down so as to secure a uniform size, it certainly looks beautiful. It realizes the ideal of the man who has devised the work and who has gathered the prints wherewith to adorn the book. The finished prints must now be arranged in the places they are to occupy in connection with the text. They should be numbered or paged to guard against displacement in the binding operation. Many other things still remain to be considered if the finished book is to approach perfection. Chronology should not be overlooked in the matter of the arrangement of portraits. There should be a harmony as to seasons of the text. A summer view and a winter text are incongruous. Preference should also be given to prints engraved contemporaneously with the events described in the subject matter. This detail gives additional interest as well as historic value.

If, as is frequently the case, there should be found too much letterpress and too many prints for a single volume, there is the refuge of having the book bound in two or more volumes. Extra illustrated books are sometimes extended to as many as twenty-five or more volumes. When more than one volume is to be made of that which was originally but one, there arises the need for extra title pages. These can be printed in *fac-simile* or they can be made with pen and ink by an expert. I have no knowledge of any better man in this line than is Mr. Charles B. King, of New York. He has duplicated title pages and copied text for me with great skill and unerring exactness. A title page having been provided for each volume, the book in inlaid sheets is ready for the bookbinder, from whom, if he be a skillful binder, the book comes as a solace and a gem to the enthusiastic owner.

The cost of binding a book, that has

been extra illustrated, by a binder of reputation like Otto Zahn, Stikeman, Adams, The Club Bindery, Miss Starr or Miss Preston, in full crushed Levant morocco, which is the only fitting dress for a book of this kind, will be in the neighborhood of from thirty to forty dollars per volume at least. The total expense of even moderately extra illustrating a book frequently reaches three hundred dollars or more, so that it is plain that it is something for the poor man to eschew. The question even for the rich man must be, "Is it worth while?" For myself I think it is. The finished book is not the only pleasure, for

there is the stimulation of months, if not of years, arising from a refined pleasure signified by the accumulation of what may perhaps be called raw material that necessarily enlarges and expands the mind, educates the taste, and increases culture. No evil consequences follow, and the extra illustrator must in the nature of things know something of the art of the period with which he has concerned himself when he has finished his campaign. There is much to be said in favor of the hobby for extra illustrating a worthy book in an artistic manner which has here only just been touched upon.

FLATBUSH, LONG ISLAND.

The Delivery of Louisiana to the United States

BY JOHN BACH McMASTER, LL.D.

[One hundred years ago on the 17th of this month Louisiana was purchased from France by the United States. To-morrow this historic event is being celebrated at New Orleans and elsewhere. We are glad to give our readers the following article on this subject by Professor McMaster, of the University of Pennsylvania, one of the greatest historians that America has produced.—EDITOR.]

WHEN our country became a sovereign, free and independent nation, our territory nowhere touched the Gulf of Mexico, nor was our flag anywhere to be seen beyond the Mississippi River. Spain owned the great west and the island on which stood New Orleans, and had just obtained from Great Britain a retrocession of Florida and all the territory south of 31st degree of north latitude. But Spain claimed more, and during 16 years held armed possession of much of the present States of Alabama and Mississippi; displayed her flag and maintained her garrisons on many a bluff as far up the Mississippi as Tennessee, and closed the Father of Waters to navigation by citizens of the United States. Not till 1795, when we made our first treaty with Spain, did we obtain from her a recognition of the 31st degree of latitude as part of our southern boundary, a promise to withdraw her garrisons north of that line (which was not done till 1799), and a right to deposit goods at New Orleans for exportation.

To our forefathers these concessions seemed little enough. The treaty ac-

Old Bank Building on Toulouse Street, New Orleans. Formerly the City Hall

knowledge of the validity of a boundary line given us at a time when Great Britain owned the territory to the north and to the south of it. The treaty provided for the removal of armed forces from a country where they had no right to be, and granted to a friendly nation the commercial use of a river, one bank of which it owned from the source almost to the mouth. Yet, mild and local as were its provisions, they set in motion a train of events which in eight years brought us the vast domain known as Louisiana.

That Spain should be short-sighted enough to make such concessions astonished and alarmed Talleyrand, who then served the French Directory as Minister of Foreign Affairs. "The United States," he said to a Minister he was about to dispatch to Madrid, "have been put in possession of the forts along the Mississippi." It was essential that Spain should hold these forts in order to stop the progress of the Americans, who were devoured by pride, ambition and cupidity. They were determined to rule America. The only way to put an end to this ambition was to shut them up within the limits which nature seemed to have traced for them. But Spain was in no condition to do this great work. She

would do well, therefore, to cede to France East and West Florida and Louisiana, and

"from that moment the power of America is bounded by such limits as it may suit the interests of France and Spain to assign her."

The French Minister at the Court of Madrid was accordingly instructed to seek for a cession to France of the territory in question; but ere the scheme was carried out Talleyrand fell from power, the Directory was overthrown, Napoleon returned from Egypt and by his *coup d'état* made himself master of France.

Once safely established as First Consul, Napoleon recalled Talleyrand to his old post of Minister of Foreign Affairs, and then negotiations for the retrocession of Louisiana went rapidly forward. So rapidly, indeed, that on the 1st of October, 1800, at San Ildefonso, Charles of Spain signed a secret treaty which bound him to return to Napoleon the Louisiana which, in 1763, France had given to Spain.

Talleyrand had triumphed. The Americans were now to be shut up within the limits which nature had traced for them; their ambition was to be checked, and such bounds as pleased France and Spain were to be set to their power. All this

Hall of the Cabildo, New Orleans. The French Roof is Modern. This Building Was at One Time Used by the Spanish Government

Jackson Square, New Orleans, as It is To-day

seemed certain to happen, yet none of it was ever to come about. How news of the secret treaty leaked out and came to the knowledge of President Jefferson; how two years slipped by before Napoleon received the order on the Spanish officials for the delivery of Louisiana; how his plans for sending over an armed force to occupy the province were delayed by the destruction of his army in San Domingo and the lack of transports at home; how during all this time not so much as a formal protest was entered by our Government, need not be related. It is enough to know that at this critical moment the Spanish Intendant at New Orleans came to our aid, and without authority and in flat violation of the treaty of 1795, took away the right of deposit at New Orleans and closed the Mississippi to our trade and commerce.

As news of this act spread northward during the late autumn of 1802 the people in Tennessee and Kentucky, and in Ohio (just about to enter the Union as a State), cried out for war. How, during the next session of Congress, the Federalists took up the cry and strove to force the war; how Jefferson asked for two millions of dollars with which to buy West

Florida and New Orleans, and so acquire the entire east bank of the Mississippi River; how the money was appropriated; how Monroe was sent to aid Livingston in making the purchase; how Talleyrand strove to prevent the sale; how Livingston passed over him and applied to the First Consul; how Napoleon met the offer to buy West Florida and New Orleans with a tender of all Louisiana; how the price was fixed, and the treaty ratified by the Senate, is a story too long to be retold.

Congress having appropriated the money (\$15,000,000) with which to pay for Louisiana, nothing remained to be done save to prepare for the formal delivery of the Province to the United States.

Quite early in the year, when Napoleon had as yet no thought of selling the Province, a plan for its government had been drawn up, and Peter Clermont Laussat sent out as Colonial Prefect. He reached New Orleans late in March and promptly issued a proclamation in the name of the French Republic. He began by denouncing the separation of Louisiana from France in 1763 as the most shameful act ever done by a weak and corrupt

St. Philip Street, New Orleans

Government; praised the love and loyalty which, in spite of this deed, the French of Louisiana had ever shown toward the mother country; reminded them that one of the first acts of the "magnanimous, just and powerful Government of Bonaparte" was to secure a retrocession, and promised that all manner of happiness should follow the new union of the mother country and her colony. A few of the French were delighted, and gave vent to their pleasure in long addresses to the Prefect, full of ardent wishes for the arrival of the expected expedition and the beginning of French rule. By the mass of the people Laussat was received with coldness or alarm. His proclamation, wrote an eye-witness of the events of the time,

"has been heard by some with sadness, and by the greater part of the inhabitants with the same indifference as the beat of the drum is listened to when it announces the escape of a slave or a sale at auction."

Not a few, recalling Napoleon's declaration, "Inhabitants of St. Domingo, whatever may be your color or your origin, you are all free!" feared that a day

might soon come when a like decree might be proclaimed in the streets of New Orleans.

The Spanish part of the population were far from pleased, and no pains were spared by their rulers to persuade, and, if necessary, force them to quit Louisiana and take up their abode in Cuba. Scarcely had the Marquis of Casa Calvo, charged with the duty of delivering the Province to France, set foot in New Orleans than officers of the militia, the clergy, the small planters, the people about the posts were required to say whether they would or would not remain subjects of the crown of Spain, and more than one who answered nay was made to suffer for his temerity. The Ursuline nuns, recalling the closing of the religious houses in France in the early days of the Revolution, petitioned the King for leave to depart and find a new home somewhere else in his dominions. Permission was given, and on Whitsunday when the sunset gun boomed from Fort St. Charles, sixteen nuns, escorted by the Governor-General, by the Marquis de Casa Calvo and a great crowd of citizens,

walked from their convent to a ship and sailed away.

Napoleon's declaration of war with Great Britain having prevented the departure of the troops and General Victor, who was to have received Louisiana from Spain, Laussat found himself without office, authority or support, and filled his dispatches to Minister Decrès with descriptions of the city and its government. The fortifications erected a few years before by Carondelet, he said, were falling into ruins. The palisade was gone, or where it still stood was rotten; the towers were crumbling, the ditches filling up, the bridges in decay, and the gates off their hinges and lying on the ground. Justice, he declared, was bought and sold; every official, governor, intendant, judge, collector—all, in fact, down to the constable, were venal, and in these statements, broad as they are, he was borne out by the American Consul in his dispatches to Washington.

In July rumors were current that Louisiana had been sold to the United States. Laussat indignantly denied them as the work of Anglo-Americans, till one day a vessel from Bordeaux brought him a commission to receive the Province

from France and turn it over to the United States.

The day chosen for the first of these ceremonies, Wednesday, November 30th, 1803, opened dark and lowering. Casa Calvo, Salcedo and Laussat, attended by the clergy, the military officers and the people, met in the Cabildo, where Laussat presented an order from the King of Spain for the delivery of Louisiana and his authority from Napoleon to receive it in the name of France. The keys of New Orleans were then handed him; Salcedo and Casa Calvo declared Louisiana and its dependencies to be the property of France, and absolved from allegiance to Spain all subjects of his Christian Majesty who wished to live under the authority of France. This done, the commissioners went out on the balcony and looked down on a sea of upturned faces and the Place d'Armes—not the little fenced park of to-day, but a great parade ground that stretched away from the cathedral to the levee that shut out the waters of the Mississippi. In the presence of these dignitaries the banner of Spain, which flew from the staff in the court of the Place, was lowered and saluted, and the tricolor raised in its

"The Ovens," in St. Louis Cemetery, New Orleans, Showing Side Vaults

stead. Spanish municipal government was immediately abolished, a French city government substituted, and the sale of Louisiana to the United States formally announced by proclamation. No French troops came with Laussat; the Spanish militia showed no willingness to serve under France till the arrival of the Americans; just when they would come was uncertain, and during the interval the city, it was feared, might become the scene of disorder and crime. Such of our countrymen, therefore, as business or curiosity had brought to New Orleans formed a volunteer company, and, joined by many young Creoles, offered their services to Laussat, and thenceforth armed bands patrolled the streets by day and by night.

But it was not in New Orleans alone that fears for the safety of the city and Province were entertained. At Washington the Spanish Minister had three times protested against the sale of Louisiana. Napoleon had not as yet made good the conditions of retrocession. Nay, he had flatly violated one of them, for he had pledged himself never to part with the Province, but keep it ever a dependency of France. That the protest at Washington might be followed by armed resistance to the transfer at New Orleans seemed so likely to Jefferson that he ordered part of the militia of Ohio, Kentucky and Tennessee to be ready to march at a moment's notice, sent troops to Natchez, gathered others at Fort Adams near the old boundary line, and bade Governor Claiborne bring some with him from Mississippi.

The two commissioners on behalf of the United States were W. C. C. Claiborne, Governor of the Mississippi Territory, and General James Wilkinson. They met at Fort Adams in December, and at once set out for New Orleans, and on the 17th of the month camped two miles from the city gate. Visits of ceremony delayed their entrance till the morning of December 20th, when the commissioners and the troops marched through the Tchoupitoulas gate and on to the Place d'Armes, where the ceremony of the transfer to France was repeated in the hall of the Cabildo, or Hotel de Ville, as it now began to be called. The credentials of Claiborne and Wilkinson, the treaty of purchase, the powers of Laussat and the *procès-verbal* were read aloud; the delivery of Louisiana to the United States was proclaimed, the keys of the city were handed to Claiborne, and all who chose to become citizens of the United States were formally absolved from allegiance to France. A short speech by Claiborne followed before the commissioners stepped out on the balcony to witness the transfer of flags. The tricolor at the top of the staff was now drawn down, and the stars and stripes at the foot of the pole raised till the two met in the middle, where both were saluted by the forts, the vessels at the levee and the battery on the Place d'Armes. Our flag was then raised to the top of the staff, and that of France lowered and carried away with much ceremony and placed in the hands of Laussat.

PHILADELPHIA, PA.

Parsifal in New York?

BY E. I. PRIME-STEVENSON

[Mr. Prime-Stevenson's musical criticisms appeared regularly in *THE INDEPENDENT* and the Harper publications when he resided in this country, and he was recognized as one of the best critics this country has produced. While we are pleased to give our readers the benefit of the following noteworthy criticism, a different view will be found in our editorial columns. The illustrations that accompany the article we owe to the courtesy of *The Critic*.—EDITOR.]

ABOUT no other art so much superficial twaddle, sentimental-religious nonsense and emotional balderdash has been written as about music. About no other musical compositions so much of this same sort of rubbish as concerning the operas and music dramas of Richard Wagner. And about no other work of Wagner has grown quite so nauseating and misleading a mass of language as about his "Parsifal." It was the concluding work of its creator's life, and beyond doubt that one which he took most seriously himself, and which he expected the world, in general, to take most seriously. An amazingly ingenious, effective and superficial *opus*, this "Parsifal!" in the score of which Wagner relapsed cunningly toward many principles of the old-fashioned Italian operas that he had so vehemently abjured. But in the drama thereto, he concocted not only the most impressive burlesque of the Gospel Tragedy, but also of one of the Sacraments of Christian worship yet to be analyzed in any theatrical environment; until art-critic, ethicist, estheticist, poet, painter, parson, mystic—by its vagaries and gorgeous musical drapery, even robust, thoughtful observers—all seem to have been hypnotized altogether. "Ralph," said Margaret Fuller, according to an old Boston anecdote, as Emerson and she were watching Fanny Ellsler dance a cachuca, "Ralph, that is poetry!" "No, no, Margaret!" Emerson is said to have

whispered as the pirouette was consummated—"that is religion!" And heaven knows not what gilding of poetry and religion and art and everything else sensuous, intellectual or spiritual, have the pens of hysterical men writers and women writers (some of whom ought to know better, some of whom cannot be expected to know better) gilded this immoral, irreligious, quite neatly blasphemous, and consummately concocted work.

Fantin-Latour

"But Parsifal
Shunned their circle of entwining arms
With gentle gesture"

From an etching by

Egusquiza

"One mystic midnight came a messenger
Of God to Titirel, and gave to him
The Holy Grail"

The present writer has heard "Parsifal" very, very often. He has had occasion to analyze its bases and development, and the secrets of its effects on now one class of spectators, now on another, with some care; until he can feel assured that its peculiar essences have not much escaped him. In no other *Partitur* from Wagner's hand is the mechanical cunningness so masterly, so magnificent, tho the real thematic and melodic inventiveness and dignity so "thin and bare." In no other work does he demand *ab initio*, that the spectator and auditor shall take his seat in the Wagner Theater at Bayreuth in such an awful, childlike, unquestioning attitude toward everything Wagnerian; above all, not with much examining into the real and true relationships to musical art, dramatic art, dignity in esthetics, when applied to art, to religion, to morals and to social principles. True, Wagner has asked this more or less imperatively in all his works, but

"Parsifal" he has made a sort of final *auto da fé* for Wagnerism's! And yet what the composer and dramatist has here set before the hushed audiences in Bayreuth, is so purely a creation of the theater and the picture gallery, its much-vaunted solemnity is so hollow, its reverence to religious mysticism so a matter of profile mere silhouette, that one can undertake the stand that "Parsifal" has no good reason for being presented only on the Bayreuth stage; that its claims to enjoy forever its much talked-of "special local atmosphere" are illusive stuff, and that the whole battle over whether it should or should not, shall or shall not be sung in, for instance, New York City this winter, is making a great cry over little wool. What is any opera, any music drama, but theatrical entertainment, more or less dignified, more or less legitimately emotional? One audience is,

generally speaking, quite as good as another, for it; quite as deserving of it. Neither nations nor churches will rise and fall because the management of a smart New York opera house "conveys"—in the Shakespearean sense of the word—a German musical play sumptuously orchestrated, and juggling especially with the story of the Savior's life and death, with the Mass, and as a cardinal ethical proposition, homosexuality, and individualism *contra* normal human nature and normal human life! In the theater nowadays pretty much everything is excused grist—Ibsen, d'Annunzio, Sudermann—why quarrel with Wagner?

Unfortunately for persons who are willing to slight off entirely all dissent from giving "Parsifal" in any musical theater capable of producing it as well or better (not difficult this last), than in Bayreuth three things are flatly hostile: Wagner's own wishes, the aspects of the drama as such, and the matter of the

commercial ethics is involved. Almost alone, each is an ample, even an insurmountable counter-argument. The Wagnerite or non-Wagnerite can well be perfectly amazed at what has been written lately in America about this!

For, first, there is not the slightest sound evidence that Wagner ever in his life would have wished "Parsifal" presented anywhere except in Bayreuth. True, both necessity and expediency—poverty, debt, obscurity—these made him retreat from this sort of exclusiveness as to other of his works. As to "Parsifal," never. It was created for Bayreuth as was no other work by him. It was given its definite shape, it was made picturesque with Roman Catholic symbolism, and full of Christian mysticism, expressly with the idea of—"Nowhere, save at Bayreuth!" It was given, too, its peculiar homosexual essence expressly as a piece of *innige* homage to that most unhappy of its patrons and auditors, Ludwig II of Bavaria. Ludwig II himself was averse to its being presented save in Bayreuth—Munich presentations not excepted. All so-called "evidence" to the sanctioning by Wagner of "Parsifal" for performance under other than the conditions of a special, solemn, "Bayreuth mood," on the part of special pilgrims to that place to hear that culminating gift to Bayreuth and to his representatives in charge of Bayreuth—all boisterous denials of this aspect from Wagner himself are hollow and impertinent falsehoods. So much for those commentators who have been trying to argue lately that Wagner would have been the first to accept a good offer of a New York performance of his most reserved work. And

as to the argument that Mrs. Cosima Wagner has surrendered this point, by the existing agreement which gives Munich the right to produce "Parsifal" when the present copyright for its Bayreuth reserve has expired, this has no weight in the question, either sentimental or commercial. That contract between the heirs of Wagner came into existence in view of certain legal reasons, personal reasons, and artistic reasons that need not be set forth here. They are sufficient and legitimate. They do not represent either indifference to Wagner's desires on the part of his successors, nor their neglect for money possibilities, nor the grounding of any precedent for any other operatic establishment whatever. If the heirs of Richard Wagner and the publishers of "Parsifal" had chosen to avail themselves of their privileges, and wished to make "Parsifal" available outside Bayreuth, they could have made an extra fortune out of their transactions in Germany alone.

From an etching by

Egusquiza

"Then suddenly the heavenly splendor fell
And flamed and glowed within the sacred Cup."

From an etching by

Egusquiza

"But off he thrust her with the last fierce words:
'Unhand me, wretched woman, be ye gone!'"

The much discussed religious aspects of "Parsifal," including its astonishingly audacious blending of the personality of Christ, and of the most solemn moment of the most solemn office of the Catholic ritual can never be "waved away" by all the Podsnaps of Europe or America. They are unsuitable for any "secular" and commonplace theater, however dignified. The notion of the average American audience, especially a fashionably-derived audience amusing itself with "Parsifal" for an afternoon or an evening in the Metropolitan Opera House, is an offense to anybody who knows well and can judge candidly the relations between social life and esthetic feeling in New York. The real musical public of New York is of the smallest fraction that would make up any such audience. The sham musical public, for whose delectation, for whose new nerve thrill this theft-artistic is planned—that sort of public is the one which makes "Parsifal" in New York City possible, and can make it

"pay"—this public is the public to hear it in the Metropolitan. A curiosity either superficially musical, or downright vulgar, and an aim for money—these inspired and will support the undertaking. Certain "wide-minded" promoters of "Parsifal" in the Metropolitan naturally claim that there is no reason why New York should not whisper and titter through a "Parsifal" as through any other serious operatic performance. This is true, from a certain standpoint of New York comment. And it is perhaps the more true, because—as has been said—"Parsifal" puts before one the paradox that its very solemnity, while extremely emphasized, really rests on a decidedly insincere and theatrical manipulation, as a drama. But in Bayreuth, this same insincerity is not marked by the more general public. The Bayreuth conditions enhance whatever is

genuinely of sound religious suggestiveness or sound moral sentiment in the hybrid work. Its spell prevails in Bayreuth as it can prevail nowhere else. The wall paper Garden of Klingsor seems a blooming seclusion, and with Amfortas's deliberate paraphrase of the Savior's "Take, eat, this is my body—" "This is my blood,"—we half forget that we are in a theater, and that the descending Holy Ghost is a stuffed Bayreuth pigeon. And women—a curiously interesting bit of psychology—amiably and hysterically do not remark that they are admiring a drama which in every essential stage-character and in every detail of its human basis was written to insult them, and to throw into their faces their ethical and sexual and social relationships to life! It is a pity that some such auditors have not read, for only one useful instance, Dr. Oscar Panizza's valuable study of this topic in Parsifalian ethics—an important one.

But over and above any religious or

artistic pleas for this proposed performance of Wagner's drama at the Metropolitan is the simple commercial one. It will be given in violation of all moral right. Wagner's heirs cannot—probably—protect their rights. Their wishes as well as their rights are helpless before that element of American greed and rapacity, of which, alas! Europe hears so much, and judges now so constantly the whole social fabric of the United States. Until copyright laws were established, American publishers could steal books, could appropriate pictures, could reproduce statuary. Until international legislation protected patents, no piece of property or process that an inventor could perfect and bequeath to his heirs was safe. Such days as to such things have passed. But they have not passed for such matters and contingencies as are involved in this cool and elaborate and excuseless appropriation of an operatic score and performance. We are told that a man's foes shall be of his own household; in this case the composer's household are in the courts* of a country foreign to them, attempting to defend Wagner's wishes and their own rights against an American public. The Wagner family have a perfectly honorable

* Since this was written the United States Circuit Court has refused to prevent Mr. Conried from producing "Parsifal."—EDITOR.

right to their position in the matter. If a sewing machine, a corn reaper, an electric patent, or any such source of their income were involved, the commercial rights and wrongs would possibly be more sincerely treated by the press. The circumstances under which the enterprises of managers are nowadays advertised in the New York and other press are, unhappily, not calculated to give the musical critic of a daily paper the privilege of being outspoken on this detail, or any other. He, too, must write to live, or must be silent to keep on writing. But the moral law as to art is generally perfectly clear, even where the civil law does not happen to accentuate. To give "Parsifal" in New York, well or ill, without the consent of Wagner's heirs and representatives is an outrage on commercial morals. To give "Parsifal" in New York, well or ill, even with such consent, will be an esthetic impertinence. To give "Parsifal" in New York, anywise, under any conditions of audience and social support, involves an insult to religion, to the social ethics, fine sensibilities, kindly feelings, the instincts of honor, respect and propriety; an insult essentially on the part of a typical section of the so-called "musical public" of the metropolis. It murders the solemn wish of a composer, and it violates the rights and property of his heirs.

POOR Santa Claus! Once he used to beam from the pages and corners of our book, but now he is debarred from his own by the multifarious outlets of our modern life. Yet there are still some writers who write for youngsters for the mere pleasure of telling them a story.

From the redoubtable Henty, whose death was a real grief to the boy world,

we have two new books, cut after the pattern of his others. *Through Three Campaigns* is a tale of Chitral, Tirah, and Ashanti, while *With the Allies to Peking* recounts the thrilling adventures of a young hero during the Boxer uprising.

Capt. F. S. Brereton is another Henty. Look at the pictures and the chapter headings of *In the Grip of the Mullah* and you have a good idea of the adventures in Somaliland, and a boy's taste for the French Revolution will be grati-

he Lady of the Lake sits by the Fountain in Arroy.

Illustration from "The Story of King Arthur and His Knights." (Pyle.) Charles Scribner's Sons, Publishers.

fied in the *Foes of the Red Cockade*. There is no telling the good arising from such books—good that overbalances the occasional distortion of facts.

The Siege of York is a tale of the days of Thomas, Lord Fairfax. The author has succeeded in weaving a charming, simple love story about the Cavaliers and Roundheads.

Cyrus Townsend Brady has added to "The Boys of the Service Series" *In the War With Mexico*. The hero is a midshipman, who has adventures on sea and land, and his meetings with Grant

and Lee, McClellan, Beauregard and others, at the beginning of their careers, will afford many hours' good reading. The legends of history are well represented by Howard Pyle's *The Story of King Arthur and His Knights*, and *Robin Hood: His Book*, by Eva March Tappan. The latter author has also written *The Christ Story* in a sympathetic narrative style.

Of a more strictly historical character are Dr. Tappan's *In the Days of Queen Victoria*, the last of "The Makers of England Series;" William C. Sprague's *Napoleon Bonaparte*; and *The Ship of State*, by Those at the Helm. The latter is especially commendable, for it comprises papers republished from *The Youth's Companion* and written by President Roosevelt, Senator Lodge and others of equal note.

Child literature embraces books about children as well as for them. Of such is the ever fresh *The Boy's Town*, by W. D. Howells, and modeled along the same lines are E. O. Laughlin's *Johnnie*, which carries him through the adolescent period even to the advent of another Johnnie, and which is most artistically printed with striking marginal sketches; *The Bending of the Twig*, by Walter Russell, whose pen as a writer is almost as facile as it is as an illustrator, so daintily is the volume prepared; and Roy Rolfe Gilson's *Mother and Father*. This last is wonderfully poignant and true in spirit, and Alice Barber Stephens has made some of the most poetic drawings for it.

The reprints for this year bring *Six Girls*, by Fanny Belle Irving, to the front, as well as Miss Alcott's *Jo's Boys*. There is an exuberant healthfulness in the tone of both that will prove acceptable to all readers, regardless of sex. Another classic in its way is *Half-a-Dozen Housekeepers*, by Kate Douglas Wiggin, a story for girls, with many surprises for sustained interest; a new book by the same writer is *Rebecca of Sunnybrook Farm*; a most lovable little girl is the heroine, and the development of her character, budding amidst the stern atmosphere of her New England home, is enlivened by her school experiences. Mrs. Wiggin has a style peculiarly pleasing, since it is variable in its intermingling of humor and pathos.

Before You Went to Bed. From "Mother and Father." Copyright, 1903, by Harper & Brothers.

An unpretentious little volume whose contents and illustrations deserve mention is Stevenson's *A Child's Garden of Verses*. In its way a reprint, with additional selections of verses and pictures from recent volumes of *St. Nicholas*, is *Baby Days*, edited by Mary Mapes Dodge. There is a varied choice of jingles and stories to satisfy very little folks.

Of the stories of a purely fictional character there is more than a full supply. Notable among them may be mentioned *Gay*, by Evelyn Whitaker, that will be warmly received by older readers. The little boy proves to be a delicate thread of childhood wound around a mystery, and there is a fresh love episode that is intensely human.

Little Betty Blew has a slight historical atmosphere; the author, Annie M. Barnes, carries the little heroine through perilous adventures in Colonial times, and her simple openness among Indians wins their friendship and a long lost brother. Annie Hamilton Donnell's *Camp Fidelity Girls* reveals four girls

quarantined from scarlet fever during a vacation. An old farmhouse is the scenic background. Ellen W. Ahrens's illustrations for the book are commendable. Anna Chapin Ray's *Ursula's Freshman* is a boy who eventually works his way through Yale. Ursula is the making of him, a delightfully unconventional girl among painfully conventional relatives. The youngster who figures as the hero in *Jack, the Fire Dog*, is a blind waif saved from a burning house. A little boy and his rich grandfather befriend him and are the means of finding his mother, and bringing happiness to barren lives. Of course, the dog figures as a hero. The book will please because of its intent rather than its style. It is by Lily F. Wesselhoeft. *Two Prisoners*, by Thomas Nelson Page, deals with a somewhat similar plot. A poor little crippled girl and a rich little girl harmonize, and a bird, figuring as the second prisoner, is the means of bringing forth the mother of the orphan. Truly, Mr. Page is capable of something more than the commonplace, and it is a relief to find that the tale is only a reprint, now tastefully bound. A delightfully told story by Evelyn Raymond is *The Mislaid Uncle*; the little heroine travels many miles by express, addressed to Uncle Joseph Smith, and her adventures occur at another Joseph Smith's house. Slightly similar in form is Etheldred B. Barry's *Little Dick's Christmas*; the hero tames a hardened old grandfather.

Of a more exciting character and with a New Orleans French atmosphere is Mrs. C. V. Jamison's *Thistledown*, telling of a young acrobat whose life is fraught with mystery. Edward S. Van Zile's *Defending the Bank* contains more pluck than it does refinement. It narrates how young detectives outwit some robbers. On the other hand, Albertus T. Dudley's *Following the Ball* proves better reading, tho it is stereotyped in development and goodness. The boys' stand-by, Edward Stratemeyer, adds to his long list of books *Two Young Lumbermen*, the beginning of "Great American Industries Series." The heroes are the means of describing the work attendant upon hard life, and will doubtless prove popular. In these days of scientific education the classics have not escaped emendation for the young. Fred-

erick Lawrence Knowles has condensed parts of "David Copperfield" and "The Mill on the Floss" in his *The Story of Little David* and *The Story of Little Tom and Maggie*. One has to decide for one's self the advisability of such book-making.

Laura E. Richards publishes three books of short stories: *The Golden Windows*, tales of a symbolical type, containing excellent writing; *The Green Satin Gown*, whose title is more alluring than the title story; and *More Five Minutes Stories*, for younger readers. *The Wonder-Book of Horses*, by James Baldwin, tells of historic thoroughbreds. The accounts will prove delightful reading and of educational value. Gabrielle E. Jackson also narrates the stories of horses in her *Big Jack*, and the same author's vigorous style is shown to good advantage in *Little Comrade*.

The New Wizard of Oz finds himself in literature while he is figuring in comic opera. After writing this book, the author, Frank L. Baum, handed it over to Denslow to illustrate, while he started on *The Enchanted Island of Yew*. While Miss Cory was making her exquisite color pictures for this work, Mr. Baum turned to *The Magical Monarch of Mo*. Popularity will deaden, it is to be feared, the fresh originality of such a book as the same author's *The Master Key*.

Of the books that deal intensively with nature, by far the most charming is Dallas L. Sharp's *A Watcher in the Woods*, which is written with that close, sympathetic touch suggesting John Burroughs in its naturalness and truthfulness. Watchers of the fields will welcome its intimate descriptions.

Of books of travel, two emphasize themselves from the Christmas mass: one, *In African Forest and Jungle*, by Paul Du Chaillu, with pictures by Victor Pérard, and the other an account of the experiences of Ahnighito, Peary's little daughter, told by herself and her mother in *Children of the Arctic*, a book as thoroughly original in illustration and text as it is tempting in cover design. Two other books impress themselves, as much for their originality as for their unprecedented size. *The Book of the Child* contains large reproductions, in color, of the work of Jessie Willcox Smith and Elizabeth Shippen Green,

with accompanying text by Mabel Humphrey. As a specimen of book-making that combines thorough taste with charm of spirit, this would be hard to equal. Of the same nature, but not as appealing, is *The Book of the Cat*, with pictures by Elizabeth F. Bonsall.

Those who are looking for books of a more fanciful character will find a plentiful supply. There is *The Outlook Fairy Book*; *The Crimson Fairy Book*, edited by Andrew Lang, whose palette of colors has not yet become exhausted; *The Star Fairies*, by Edith Ogden Harrison; Helen Broadbent's *The Dew Babies*, well told and illustrated, for older children; *Orchard-Land*, a mixture of nature and imagination, agreeably written by Robert W. Chambers, with illustrations by Birch; and *The Big Book of Nursery*

Rhymes, edited with care by Walter Jerrold, and with drawings daintily conceived by Charles Robinson. The ever welcome *Chatterbox* for 1903 appears in its unchangeable form. For entertainments no more opportune book can be had than Netta Syrett's *Six Fairy Plays*, that form good reading and are suitable for presentation; and the collection of *Pickaback Songs*, with music delightfully simple and melodic.

The ultimate result of such a hasty review is the decision that when one goes shopping for little readers there is great variety from which to choose. What to buy leaves the responsibility upon the one who buys, and if this glance into book-land proves of any material assistance, it stands justified.

NEW YORK CITY.

The Hague Tribunal

BY W. L. PENFIELD

COUNSEL FOR THE UNITED STATES BEFORE THE HAGUE TRIBUNAL

THE trial of the Venezuelan Arbitration closed on November 13th.

The Tribunal then adjourned, and will only reassemble for the purpose of announcing its decision, which, it is conjectured, will be given next February.

A brief review of its proceedings may not be without interest to those who have watched the progress of international arbitration, which is itself again on trial before The Hague Tribunal.

The question has been asked: Is the Hague Tribunal really a great Court?

The answer is clear. Nearly all of the twenty-six signatory States of The Hague Convention have named arbitrators, now numbering nearly seventy in all, who are styled "The Permanent Court." The term is slightly misleading, since they constitute simply a permanent panel from which the arbitrators are selected to hear and decide any controversy which differing States may agree to submit to the Tribunal.

While it is possible that not all of the members of the permanent panel have been so appointed, with due regard to

the qualifications necessary to the discharge of the functions of arbitrators, it has not yet been shown that such is the case; while, on the other hand, it is abundantly evident that a large number are worthy of the great places which they may be called upon to fill.

There are five arbitrators in the "Pious Fund" case—one from England, two from Holland, one from Denmark and one from Russia; and the judicial competence and impartiality of the members of that Tribunal was shown throughout the proceedings, as well as by the decision given. Not less can be said, down to the present moment, of the arbitrators in the Venezuelan case. In both trials the attention generally given by the arbitrators to the evidence and the arguments was marked with that sustained dignity, high intelligence and perfect courtesy which were to be expected from such a tribunal.

The sessions of the present Tribunal were opened by its President with a brief address, in which he pointed out the significance of the present arbitration,

which, from the number of the parties engaged and the importance of the issues involved, is more truly international and world-wide in interest and character than any other arbitration that was ever held. Justice is the corner-stone on which the prosperity of the State is founded, and the growth of commerce among nations largely depends upon the international administration of justice. The decision to be given should therefore have great influence on the relations of creditor and debtor States, inasmuch as the issue presented is whether a declaration of war by a creditor against a debtor State gives the former the right of priority over other creditor States in the payment of their respective claims.

That "the mind is moulded to the material it works in" is not less true of judges than of other men. The tendency is to rise with the subject and the occasion. Considering the reputation generally of the members of the Permanent Court for learning, ability and character; that they are accustomed to deal with large affairs; that, as members of the Tribunal, the highest mental and moral faculties are called into action and put to the severest test, it necessarily follows and is true that The Hague Tribunal, like the Supreme Court of the United States, great in the beginning, always tends to become greater in the mass of talent and qualifications brought to the decision of questions submitted to it.

The force of such influences was revealed in the words of the Tribunal spoken by its President in closing the trial on November 13th:

"The final moment has come. We have reached the end of the oral debates, and I pronounce them closed. Before separating, permit me to express very cordially, in the name of the Tribunal, to the representatives of the Parties, Agents and Counsel, our deep gratitude for the valuable and untiring assistance that they have not failed to afford us in our laborious search after truth. It is now for us to put this truth in a form as clear and complete as possible within the narrow bounds of human justice, and we shall bring to it all the power and all the strength of our conscience and of our mind." Our deliberations "are now coming to an end, but their immense significance will leave a deep impression on the fruitful field of pacific arbitration, and we hope that for the greatest good of the world the abundant growth of the seeds sown will not have long to be awaited."

As was stated in a previous article by the present writer in *THE INDEPENDENT*, the protocols prescribed the English as the language of the proceedings, but authorized the Tribunal to allow oral arguments to be made in other languages.

Naturally, the counsel for the French Government made an effort to have the French declared the official language. This provoked a lively discussion and resulted in a decision that both English and French should be official languages. This, however, seemed to opposing counsel to be an addition to the protocols themselves. Mr. Bowen then suggested that a strict adherence to the provisions of the protocols in this regard would be conducive to the bringing of other cases before The Hague Tribunal. The force of the suggestion led to a prompt modification of the decision, whereby the English was recognized as the official language, and the French as subsidiary; this for the convenience of the Tribunal and of counsel, some of whom had not a familiar use of the English.

The decision, finally given, met with general approval, for it was an agreeable and satisfactory solution of one of those vexatious questions of procedure which arise in all courts. The decision constitutes a valuable precedent.

The oral arguments were opened on October 4 by Mr. Wayne MacVeagh, on behalf of Venezuela, who, as representing one of the late belligerent States, discussed at large the question of the ethical propriety of the war waged by the Allies against Venezuela. The Tribunal then adjourned to November 4. The oral arguments were then resumed, the representatives of the parties speaking in the English-alphabetical order of States.

Mr. Woeste opened for Belgium. He contended that the mere fact that the Allied Powers were claiming a preference over other creditor States imposed upon them the burden of establishing their right, which they had failed to do.

Mr. Clunet followed for France. He argued that the claim of preferential treatment was of a novel character, and that France, having obtained a diplomatic adjustment of her claims against Venezuela before the war was declared by the Allies, was entitled at least to equal treatment.

Mr. Buenz spoke for Germany. He contended that the assignment by Venezuela of the 30 per cent. of the customs revenues of the ports of La Guaira and Puerto Cabello for the payment of the claims had been obtained by the military action of the Allies; that the security was inadequate for the payment of all the claims within a reasonable time, and that in equity the claims of the Allies should be first paid.

Sir Robert Finlay opened, and was followed by Mr. Cohen and Mr. Richards for Great Britain. They argued at large the points urged by Mr. Buenz, and they further contended that the Allies had given notice to the United States, France and Belgium of their proposed military action; that none of the Peace Powers had raised any objection, and had thereby acquiesced in the action taken by the Allies and in their claim for preferential treatment; that the United States Government had acted as the medium of communication between Venezuela and the Allies, and that the United States had thereby tacitly waived any claim to equal treatment; that the Peace Powers who expected equal treatment should have joined with the Allies in their military operations.

Mr. Pierantoni followed for Italy, laying stress on the contention that Venezuela had acted without due regard to her international obligations.

Mr. Pardo spoke for Mexico, arguing in support of the right of the Peace Powers to equality of treatment. Mr. De Weckherlin spoke for the Netherlands, and Sweden and Norway; the Marquis of Villasanda and Mr. Clunet for Spain, Mr. Penfield for the United States and Mr. Paul for Venezuela.

At the close of the opening arguments the President declared in substance that he thought it not inopportune to draw attention to the words of one of the British counsel, who

"spoke of the part played by force and war in international relations in terms to which it would be difficult for a Tribunal founded on peace principles to adhere. Now that this delicate question, which perhaps does not have to do directly with our deliberations, has been debated, altho in a contrary sense by the Spanish Counsel, I declare in the name of the Tribunal that it reserves its decision on this important point, undertaking to elucidate it in its award."

The arguments in reply were made by Mr. Woeste for Belgium, Mr. Clunet for France, Mr. Buenz for Germany, Sir Robert Finlay for Great Britain, Mr. Pierantoni for Italy, Mr. Pardo for Mexico, Mr. De Weckherlin for the Netherlands, Sweden and Norway; Mr. Clunet for Spain, Mr. Penfield for the United States, and Mr. Paul for Venezuela. The oral arguments occupied twelve days in all—two days in October and ten in November. At the close of the arguments the Tribunal directed that the parties should transmit to the Secretary-General, for its use, complete tables of the claims already allowed by the Mixed Claims Commissions at Caracas.

Aside from the interest centered in the argument of the issues in the case, it was curious to observe so many counsel, of so many nationalities, engaged together in the trial of a law suit. There was a native Venezuelan counsel, speaking in an eloquent and patriotic strain for his country; there was a young Spanish Marquis, speaking of the ancient glories of Spain; there was Mexico side by side with the United States; there was the counsel for France, speaking in the brilliant style of exposition and with the dramatic delivery of the old pleaders of the French bar; there was the Belgian Minister of State, acute, analytical and trenchant; there was the counsel for the Netherlands, speaking directly to the question in plain and plausible terms; there was a Roman Senator pleading the cause of Italy; there was the counsel of the German Government speaking with strong, manly sense, and there was the historic bar of the British Empire represented in the dignified and polished arguments of the Attorney-General.

After the trial was ended, the arbitrators referred to this aspect of the proceedings as having much interest, because of the varying manner in which the issues were viewed; of the marked national individuality in the expression of ideas and in the methods of presenting arguments, by different counsel, trained in the courts of Europe or of the New World, representing eleven States having divergent forms of civilization, yet all paying homage to its chief aspiration—to the decision of a permanent tribunal.

Editorials

The Independent for the Library

SINCE THE INDEPENDENT adopted the magazine form, we have had frequent requests from subscribers and librarians that we would devise some method by which its fifty-two issues might be attractively bound for permanent preservation in less than four volumes, as is the case at present, with a separate index in each volume, and at a moderate cost. We have now been able to make arrangements by which this reasonable request can be granted. If our readers will return to us their copies of THE INDEPENDENT for a half year, in good condition, with \$1.50, we will return a bound volume containing the twenty-six issues of the paper, advertising pages omitted. In other words, for \$3.00 a year, which covers binding and return postage or expressage, we will undertake to return two handsomely bound volumes for fifty-two issues of the paper. Each volume, separately indexed, will be about two and three-quarter inches thick, and will not be too bulky to handle. The binding will be what is known to the trade as "half-binding"—that is, the back will be of brown duck, stamped in gold, with marbled board sides, the whole being very durable and neat. We have had some copies of THE INDEPENDENT bound in this new way experimentally, and the general effect of the trial volumes is most pleasing to the eye. They will prove a decoration on the shelves of any library.

We trust we may be pardoned in this connection for breaking our custom in such matters to say that there is no other weekly or monthly published in the United States that covers *the whole field of thought* with such comprehensiveness and proportion as does THE INDEPENDENT. It is not an organ of any party or creed. Those events which we cannot anticipate, we interpret after they have happened, and no other journal aims to do exactly this and allows sufficient space in which to do it. As *a history of our own times*, THE INDEPENDENT is, we think, unsurpassed; and both

as an encyclopedia for reference and an expositor of the underlying currents of our national life, it is worth preserving for subsequent reference. We trust that many of our subscribers will, with the first issue of the new year, begin to save their INDEPENDENTS and have them bound for permanent preservation. They will not regret it.

The Twilight of the Gods

THE death of Herbert Spencer is an event of far deeper significance than usually attaches to the close of a great career. It is the passing of the last heroic figure of an intellectual era that, all in all, was the most remarkable thus far in the world's history. To the four superlative ages that Voltaire recognized as worthy of the attention "of those who think, and yet more of those who have taste," the nineteenth century added one pre-eminently worthy of the regard of those who think, and not unworthy to rank with its forerunners in the appreciation of those whose feeling for beauty is chastened by knowledge. If the age of Pericles surpassed all later centuries in plastic art and speculative daring; if the age of Augustus set for all time the standards of material splendor and literary grace; if the age of Florentines and Elizabethans set free the human spirit as it never had been free before; if the age of Racine, of Corneille and of Molière appraised the outward things of form and elegance with a nicety of valuation that may not again be equaled, it still remained for the Victorian age to penetrate the secret of the world itself, to rear the noble fabric of scientific knowledge, and thereby to inspire man henceforth in his creative art and in his moral life to

"draw the Thing as he sees it for the God of Things as They Are."

It is not only natural, but also just to speak of this era as the Victorian Age, because, while the scientific minds of France and of Germany have made in-

valuable contributions to the sum of "natural knowledge," and while the names of the great landscape painters of France, and the name of the German, Wagner, in music, must forever stand pre-eminent in nineteenth century art, it was, after all, the commanding group of English thinkers that grasped the full meaning and range of modern scientific discovery, and, seizing upon its most vital elements, by their power of organization and exposition compelled the whole race of man to reconstruct its theory of the universe from the foundation. And it was the English masters of song, Browning and Tennyson, who gave wing to the new thoughts, that they might be borne on currents of feeling to minds not easily reached by the weightier words of argument.

Charles Lyall and John Stuart Mill were the forerunners of this intellectual tide. Their voices rang in a wilderness of dogmatism more dreary and lifeless than an alkali plain. But they were not the revealers of the new truth itself. No group of more interesting men has lived than that composed of the life-long friends and coworkers, Charles Darwin, John Tyndall, Thomas Henry Huxley and Herbert Spencer. We doubt if ever again young men just awakening to the supreme interest of intellectual things can be so inspired as were the students and teachers who, thirty years ago, eagerly welcomed each fresh volume of evolutionist science as it came from the press. There was a sense of reality, a consciousness of sharing in the most stupendous revolution of belief that mankind had experienced, which gave to the acquisition of knowledge in those days a zest that can hardly be experienced in like measure again. It was a feeling as of actually taking part in the creation of a new heavens and a new earth, and the imagination could picture no bounds to the possibilities of human progress that were revealed by a world conceived not as once for all created, but as endlessly developing.

Of the minds that made up that potent group, Herbert Spencer's had by far the widest range and the greatest constructive power. It may be doubted if on the side of intellect alone Spencer has had any peer. More than to the patient in-

vestigator, Darwin; more than to the brilliantly imaginative Tyndall; more than to the fearless, incisive, tireless champion, Huxley, the world is indebted to Spencer for the completeness, the convincing substantiality of the philosophy of evolution. It was about the personality of Spencer, also, that the scientific minds of his age naturally arranged themselves. All of those that we have named were his intimate friends. Each of them over and over acknowledged his individual indebtedness to Spencer's leadership. He was the center of such a coterie as will not soon be seen again. Mill, Lewes and George Eliot were his companions and admirers. In this country Youmans and Fiske made smoother for him the paths of success.

It is with a sense of immeasurable loss that the younger men who, at the beginning of their life work, were lifted out of the commonplace, and inspired with the highest conceptions of intellectual privilege and duty by the writings of the great Victorians, realize to-day that all are forever gone. Their work is done so far as in their life times they could do it; but as an abiding influence in the world it is only now begun. The twilight of the gods has fallen, but the power of their words endures.

Mr. Roosevelt and the Corporations

IN these closing weeks of the year there has sprung up a rank growth of political rumors—some of them manifestly empty and absurd, some clearly malicious, and others so connected with known facts that they are now coming to be accepted as true. During the four weeks immediately preceding the recent meeting of the Republican National Committee, the country was full of reports about Mr. Hanna. He had yielded to the appeals of his friends, it was said, and was about to become a candidate; or, he had secretly been a candidate all the time and had been working the machinery of politics for himself in devious ways; or, he was in league with certain great financial powers to prevent the nomination of Mr. Roosevelt; or, he was engaged in intrigues of various kinds, all

of which involved the several degrees of perfidy known in politics of the baser sort. In company with these reports were others about the President, who, it was asserted, had lost substantially all of his great popularity, even in the West, and had become a wearisome burden to every Republican patriot. This was sorrowfully admitted in large type by newspapers friendly to Mr. Perry S. Heath, and was seen very plainly by Democratic journals that had the interests of the Republican party at heart.

An interesting statement was published on the 10th inst. by a well-known Washington correspondent, Mr. Walter Wellman, in the newspaper edited by Ex-Postmaster-General Charles Emory Smith and in one or two Western journals. We refer to it because it has excited much comment. At the beginning Mr. Wellman says:

"President Roosevelt has refused to make terms of peace with the Trust and railway corporation leaders of New York. They approached him with an offer to withdraw their opposition to him if he would give them certain assurances as to his future course. The President declined point blank. Angered by this rejection of their proffers of peace and the failure of their plan to tie the hands of the President for the future, they started a movement designed to bring Senator Hanna forward as a candidate for the Republican nomination. This, too, has failed. Mr. Hanna is not willing to become a candidate. These important disclosures, which I am able to make *on the highest authority*, explain much that has been going on above and beneath the surface during the past month."

Mr. Wellman proceeds to say that a representative of the great interests mentioned called upon the President to ascertain if an amicable understanding could be reached, if some assurances would not be given as to the President's course during his second term, "some pledge that nothing should be done that would destroy business confidence," or injuriously affect commerce and finance. The substance of Mr. Roosevelt's response this correspondent, writing over his own signature for Mr. Smith's newspaper, and with "the highest authority," professes to give "with great accuracy":

"The President replied that he did not know exactly what was meant by the question. If it meant that he was to give a promise that he

would not forward the interests of the United States in its foreign relations as occasion arose, he certainly could not give such a pledge. He should go on doing his duty as he saw it. If it meant that as to the prosecution of Trusts or unlawful combinations he should bind himself to do nothing in the future, he most certainly could not assent. Wherever he saw a flagrant violation of the law and of public policy, as in the Northern Securities case, he meant to hit it. He might find it necessary to prosecute other companies, if the Government should be sustained by the Supreme Court. 'And finally,' said the President, 'as to pledges not to upset the business prosperity of the country, if any such pledges are necessary as a condition to my re-election, I am not fit to be re-elected at all. I decline to give any pledges.'"

It is then asserted that with this conversation in mind Mr. Roosevelt wrote the following final paragraph of that part of his message which relates to the Trust laws and the Bureau of Corporations:

"There shall be no backward step. If in the working of the laws it proves desirable that they shall at any point be expanded or amplified, the amendment can be made as its desirability is shown. Meanwhile they are being administered with judgment, but with insistence upon obedience to them; and their need has been emphasized in signal fashion by the events of the past year."

Following this unsuccessful appeal, Mr. Wellman says, signs of a movement for Mr. Hanna were seen in many parts of the country, and the Senator was urged by the "corporation leaders" to save the party by becoming a candidate. The support of these corporation interests was offered to him. But he did not yield. At the same time, it is asserted, bank connections were utilized to create an impression far and near that the President was reckless and dangerous. Mr. Wellman says that hundreds of letters inquiring whether the President had not lost some part of his popularity were sent by Mr. E. H. Harriman, the head of the Union Pacific and Southern Pacific Railway systems, to his own agents and employees in the West, and that the replies tend to confirm Mr. Harriman's conviction that the President ought not to be nominated.

All this deserves attention, because the writer of the story virtually declares that it comes from the President himself. It is well known that some of the capitalists

who have been grouped by the recent concentration of railway systems and industrial interests were greatly offended by the Northern Securities suit, and that others dislike the President on account of his successful attempt to procure publicity legislation relating to corporations. When acting in harmony, these gentlemen can exert enormous power; but for some time past they have not been in perfect agreement. It seems improbable that all have united in sending an agent to the President to ask for pledges. Moreover, the questions or requests addressed to the President, as reported in this statement, do not necessarily point to a dishonorable promise or pledge, altho they do suggest the inference that the prevention of further attack upon railway and industrial combinations was sought. Again, it is possible for a capitalist to prefer Mr. Hanna to Mr. Roosevelt as a candidate, and to strive for the substitution of the first for the second, with an honorable motive; not, however, in our opinion, with a really intelligent desire for the continued success of the Republican party or for the purification of politics.

Without intending to question the sincerity and truthfulness of Mr. Wellman, we must say that the importance of his statement, as it is designed to be understood, calls now for the submission of absolute proof of its accuracy. It should be fully substantiated or clearly disproved, by somebody. Its nature and the circumstances attending its publication tend to give it the force of an official utterance. If any one has been misunderstood, or if any other person has been misled, this should be brought out. If there has been no misunderstanding, no exaggeration, no inaccuracy; if it be true that the small group of men who in these days have come to control the railways of the United States, to exert a dominant influence in banking and finance, and to rule over many important industries, have sought to exact from Mr. Roosevelt, as the price of their support and favor, pledges restraining his action upon great questions of public policy for five years to come;—then we have at hand a new political issue transcending in importance any other that is now before the American people.

Objections to "Parsifal"

THE article by Mr. Prime-Stevenson, which we are glad to print in this number of THE INDEPENDENT, sums up the objections that may be advanced to the performance of Wagner's last drama anywhere than at Bayreuth concisely, tho with some vehemence of language. He is not an ardent admirer of Wagner, and it seems that the objectors to Mr. Conried's project are for the most part of this lukewarm variety, or else they are Cosima-Wagnerites, as distinguished from Richard-Wagnerites. It is significant that of the leaders in the Wagnerian movement, both here and abroad, the only ones, with few exceptions, who regret the breaking of the Bayreuth monopoly are those who are intimate friends of Mme. Cosima Wagner. The others have long since given up their allegiance to Bayreuth, because they know that in many respects Wagner's wishes are not carried out there.

It is true that, as Mr. Prime-Stevenson remarks, Wagner expressed the desire that "Parsifal" should be reserved for Bayreuth. But he had also intended to reserve the four Nibelung dramas for Bayreuth. Had he done so, it would have been nothing short of an artistic calamity. Luckily, pecuniary necessity compelled him to abandon this foolish plan. He would have done the same thing with "Parsifal" had he lived and needed money; in fact, he did sell it (even before it was completed) to the King of Bavaria, for Munich; but the King afterward generously gave it back to him, without asking his money back. Wagner usually managed to have his cake and eat it! To treat his temporary wishes regarding "Parsifal" as something sacred is a mistake. Had he lived until the present day he would doubtless have long since given it to the world.

Those who have read his prose writings and his letters to friends know that there were two reasons why he wanted to restrict his last work to Bayreuth. In the first place, he wanted to insure his widow and his son a comfortable income. This motive exists no longer, because his family's annual income is estimated to exceed \$100,000; Paris alone contributes over \$20,000 a year. The second reason

why he wanted "Parsifal" to be given only in Bayreuth was that he feared that no other German city would follow his directions. He had the most painful experiences throughout his life of slovenly and incorrect performances of his works, and in the very letter in which he expresses the wish that "Parsifal" should be confined to Bayreuth he gives his chief reason—the fact that he could have no confidence in the operatic managers who, on all sides, were begging to be allowed to perform "Die Walküre" before "Rheingold," which was like playing the second act of a drama before the first has been heard. But in all these respects there has been an enormous change and improvement since his death. The German opera houses now vie with each other in their eagerness to produce these operas in exact accordance with the composer's intentions, so that the artistic reasons for the Bayreuth monopoly also have ceased to exist. "Parsifal" will, in all probability, be done as well next week in New York as it is done in Bayreuth, if not better.

Regarding the religious aspect of the case there seem to be as many opinions as there are minds. One New York organist was not allowed to have his choir sing "Parsifal" selections on the ground that they were blasphemous; another church lends its choir boys to Mr. Conried and the "Parsifal" lecturers. One clergyman has objected to the ray of light which illumines the Grail as impious—an artificial miracle—whereas one of the most eminent American critics, Mr. L. C. Elson, of puritanical Boston, wrote, after hearing the opera at Bayreuth, that "the lifting up of the Grail and its suddenly giving forth a red glow is a rather prosaic effect in these days of electric lighting, and suggests frivolous, rather than deep, thoughts." Obviously in matters of this kind it is in bad taste to express too positive opinions in too violent language. And it is certainly absurd to object to "Parsifal" in a town which has approved of "Ben Hur" and "Everyman."

The commercial and social objections are as futile as the others. It is unfortunate that we did not always have an international copyright law; but under the present circumstances it is no more

wrong—so the courts have decided—to produce "Parsifal" here than any other foreign opera. Most futile of all is the contention that it is an offense to present a work of the character of "Parsifal" to a New York audience. The objectors seem to imagine that these Bayreuth audiences are made up of bands of pious pilgrims, without any taint of frivolity or worldliness. In reality the sincere lovers of art constitute a minority; the other auditors are partly tourists, who "do" Bayreuth as they "do" the other sights and sounds of Europe, and partly members of the European aristocracy, anxious to idle away a week. Thorough acquaintance with the character of Mme. Wagner leads one to suspect that the chief cause of her eagerness to continue the Bayreuth festivals and the "Parsifal" monopoly is her love of playing the *grande dame* in receiving these aristocratic visitors.

The Union League Club on Disfranchisement

WE are sorry that Mr. Robert C. Ogden was not present to defend his objections to the resolutions adopted at the meeting of the Union League Club of this city last week, in favor of reducing the representation in Congress of those States which limit suffrage; for there was no one to take the other side. When the subject was brought before the club nine months ago, Mr. Ogden's opposition and that of some others prevailed to postpone a vote until after further investigation by a committee, which last week brought in the resolutions that were adopted by a large majority.

The resolutions first request the Government to instruct the District-Attorneys to prosecute every case where there has been an illegal suppression of votes, if adequate evidence can be obtained. This is right, and no one could properly object to it.

The resolutions next propose that Congress shall thoroughly and impartially investigate the charges of suppression of votes, contrary to the Fourteenth and Fifteenth Amendments, and that, in every case where there is such limitation of the franchise, representa-

tion in Congress be proportionally reduced; and, further, that where present legislation is not sufficient to protect the free exercise of the ballot, amendatory acts be passed to remedy such defects.

It is this resolution that Mr. Ogden, who was unavoidably detained, and some others opposed last spring, on the ground that it would do more harm than good, by stirring up a general feeling against the negro race, and would keep the negro question in politics, much to the injury of the negro.

Beyond question a number of States, Massachusetts among them, have passed legislation limiting the suffrage in such a way as would come under the Amendments. They forbid the ballot to illiterates. It is only just that in such cases representation be reduced, and it is not difficult by the Census to find how many illiterates there are. In Massachusetts the number would be inconsiderable, and the law against illiterate voters is of no appreciable effect and might be repealed. In other States, Louisiana or North Carolina for example, where illiterates are excluded, exception is made of such illiterates as can understand and explain a provision of the State constitution when read to them. It is true that this provision was not meant to be impartially administered. It was intended that the registrars should apply it leniently to whites and more than stringently to negroes; but that is a matter of administration and not of law. What census can tell us how many are properly eligible to vote under the provisions of the law, and how many are excluded?

Be it understood that the provisions of these laws of Virginia, North and South Carolina, Florida, Georgia, Alabama, Mississippi, Louisiana, Texas, Tennessee and Arkansas require educational qualifications; but they say nothing of negroes and they apply, in language, to both races. It is their administration that is unjust and oppressive. They were framed with this purpose. It is only just that such States should have their representation reduced, but how to do it we do not see, because it seems impossible to make any enumeration of those who are ex-

cluded for not understanding what is read to them. It would be very nearly as difficult to make a census of those who are admitted or excluded under the "grandfather" provisions of four States. We wish the figures could be found and the census taken and the representation reduced, but we must face the apparent facts. We do not undervalue the righteous sentiment which underlies the action of the Union League Club; and we are not particularly concerned by the prudential considerations adduced; we simply fail to see any prospect of doing anything about it in this way.

When a total ruling community is determined that a law shall not be enforced, or that justice shall not be done, they are sure to nullify any laws. We have found it out everywhere. Our liquor laws are an example. In such a case the only practicable thing is to reform the community, which is a slow but a sure process. The Union League Club has expressed a prevailing right feeling, but its action will do no further good. We wish its object of reducing representation where the vote is suppressed might be accomplished, but it cannot. Yet another remedy can be slowly applied. It is the old remedy of education, not of the ignorant negro alone, but also of the ignorant white man. The mountaineers and the crackers must have schools, as well as the negroes. The hope of the South and the hope of the country is in the mission work of developing a sentiment that will educate and elevate the ignorant of both races, and that will slowly demand and grant equal honor to character and equal administration of law. Thus only will ignorant whites and negroes become fitted to vote, demand the right to vote and be allowed to vote, and the present injustice come to an end. Does it seem a slow process? Cosmic processes are slow, but they cannot be hastened by lashing the horses of Phœbus to make them rear. It is only forty years since emancipation, and a vast deal has been done in that time. It may take forty years more to right present wrongs; meanwhile missionary societies, and boards of education, and Mr. Ogden's excellent organizations, and schools and colleges

for both races will keep at work and will surely succeed. The action of the Union League Club will be heard as a strong utterance of a just indignation, and will prove that those who fought for equal rights have not fallen from their high moral estate; but much as we wish that what they ask might be done, we expect a slower and a surer remedy.

The Smoot Case.

OUR total sympathies are with the opponents of Mr. Smoot's admission to the Senate of the United States, and yet it is not now easy to discover on what grounds he can be excluded.

It is acknowledged that he is not a polygamist. If he were, that would be ground enough. A polygamist is not fit company for American Senators.

Another possible ground is that he is an active officer in an ecclesiastical organization which supports polygamy, and that he believes in it. His belief, so long as he does not practice it, is not criminal, just as we say that a man must not be punished for simply believing in Anarchy. If it can be proved that he performs the ceremony on the plural marriage of others, that will be a serious charge, and ought to exclude him from the Senate, but we suppose it cannot be proved. All that can be proved, we suppose, is that a considerable number of Mormon Apostles and others are living in polygamy and that they have entered into that relation since polygamy was professedly given up, and since Utah was accordingly admitted as a State. We suppose there are scores and scores of such cases, and that they are not prosecuted in the State courts. If it can be proved that Mr. Smoot is actively responsible for these offenses, that he as an officer of the Mormon Church has promoted and not opposed this condition of things and has screened these violators of law, then he is not a fit man for Senator, but we have seen no evidence of it beyond the fact that he is an Apostle. He himself does not enter into plural marriage, and who knows that he is guilty of its support?

The only other charge that we know of that can be brought against him is

that he has taken a vow of loyalty to the Mormon Church that is superior to his oath of loyalty to his country. That is no offense at all, and ought to be no bar. We observe that a gentleman who bears the title of "Judge," writes from Salt Lake City to one of our religious journals:

"Suppose a Cardinal of the Roman Catholic Church should announce himself a candidate for Senator of the United States, what would happen then? Would all who opposed him be put down as the enemies of his Church? Of course, he would be unfrocked at once and lose all power as an officer of the Church; but it would not stop there. The American people would not have a Cardinal of the Church of Rome a Senator for very many and most obvious reasons, the chiefest of which would be that by the obligations he had taken his first allegiance was to Rome."

The Judge is greatly mistaken. Cardinal Gibbons is just as eligible to the United States Senate as is the Judge himself. If he is not eligible neither is Archbishop Farley, or Bishop McQuaid, or any Catholic priest, or any layman that now sits in the Senate. They are all ecclesiastically subject to Rome and politically subject to the United States. Cardinal Gibbons does not believe that his allegiance to the Pope can contravene his allegiance to his country. The soaring lark does not pierce the breast of the level-flying dove. They move in different planes. It is better to obey God than man, but loyalty to God and loyalty to the State will not clash; if they do then we will all of us repeat with John Quincy Adams his reply to George Lunt's "My Country, Right or Wrong":

"If then thy country trample on the right,
Furl up her banner and avert thy sight."

As to the Mormon Church or State it is not enough to talk of the old Danites, or the ancient war against the United States Government, any more than to talk of the treason of the seceded States. That is all condoned and pardoned, whether to South Carolina or to Utah. If it could be proved that the oath or allegiance of the Mormon Apostle to his Church makes him a citizen of a foreign nation, which is impossible, or if it can be proved that this oath or allegiance is of a peculiar sort which is inconsistent with allegiance to one's country, then it will

be possible and right to deny Mr. Smoot admission to the Senate. But this he would deny as indignantly as a Catholic or a Covenanter denies that allegiance to his Church is inconsistent with full loyalty to his country; and therefore we do not see, without further light, how Mr. Smoot can be excluded.

And this we say fully sympathizing with the sentiment of the women and ministers who oppose his admission. We agree with them that polygamy still exists in Utah and that new plural marriages are still occasionally entered into, and that the Utah courts are guilty, and wilfully guilty, of a great wrong in protecting this evil. We agree with them that the Mormon Church is a vicious and tyrannical organization, which is collusively guilty of the polygamy which exists, and that it maintains a dangerous control over its weak and obedient followers. But we do not expect to do any real hurt to that Church by shutting out of the Senate the man whom it has nominated and elected through its influence over the legal voters of Utah.

Colombia at the Hague If Colombia wishes to present a case against the United States to the Court of The Hague, we ought to make no objection, provided the case is one that such a court can properly consider. We presume it would concern the question whether the United States has wronged Colombia by preventing her from sending an army to subdue Panama. On that question we should have Panama on our side, and it would be two nations against one. Further, it would be so difficult to prove that the United States was not justified under the treaty of 1846 in preserving peace on the Isthmus that it would not be worth while to go to The Hague at all. It is true that we are forbidding Colombian troops to land anywhere in Panama, even outside of the neighborhood of the canal and railroad. But there is no population and no property in Panama outside of that canal belt; and any landing of troops from Colombia would be solely for the purpose of disturbing just that region which we are bound to protect against disturbance. It is easier **and better and quite right for us to stop**

them and send them back before they reach the zone they wish to disturb. We have interfered before to the benefit of Colombia; now it happens that we do it to the benefit of Panama, which is lucky for Panama and unlucky for Colombia. It is lucky also for us and for the world, which is no objection to our doing the right thing. So let Colombia go to The Hague, if she thinks she has any case.

General Wood's Promotion

We published a month ago an article by General T. M. Anderson, which has been much copied, showing how large is the number of those officers who are jumped by General Wood's proposed promotion. But General Anderson did not tell all the story. In addition to the officers enumerated by General Anderson, there are some five hundred other officers who were the natural seniors of General Wood by reason of age and length of service, who are now his juniors in rank. Leonard Wood entered the military service as an Assistant Surgeon in the Medical Department, with the rank of First Lieutenant, mounted, on January 5th, 1886. There is a law which has been in existence from time immemorial which provides that an Assistant Surgeon in the army shall be promoted to the grade of Captain, mounted, after five years' service, on passing the prescribed examination. Under the provisions of this law Leonard Wood became a Captain, mounted, in the Medical Department of the army on January 5th, 1891. At that time the length of service required to attain the grade of Captain in the line of the army varied from about ten years in some few cases to about thirty years in others, the average being about twenty years. So when Leonard Wood became a Captain on January 5th, 1891, he "jumped" all the First Lieutenants in the line of the army, Cavalry, Artillery and Infantry, some five hundred in number at that time, all of whom were his natural seniors in age and length of service. This was a matter of but small consequence as long as he remained in the Medical Department, but when he was translated to the line of the army it became a serious matter indeed.

Presbyterian Union It is a strong committee which was appointed by the last Presbyterian General Assembly to consider the various phases and propositions for Church union or federation. The chairman is William H. Roberts, D.D., who is secretary of the Pan-Presbyterian Alliance, and the committee includes the present Moderator and two previous Moderators of the Assembly. With this committee there met last week committees of three other Northern Presbyterian bodies, who are considering the advisability and conditions of corporate or federal union. It ought to be absolute corporate union—with nothing less should they be satisfied. There is no longer any reason why the United Presbyterians should flock by themselves to their own detriment and the scandal of Christianity. This committee has also been listening to proposals from the National Federation of Churches that all our Evangelical Protestant Churches form an alliance or federation which shall permanently and visibly express their now too much concealed spiritual unity. It was proposed that delegates from all these denominations be chosen to meet in 1905 or 1906 to organize such a federation, and this proposal was favorably received, and it is to be hoped that it will be approved by the General Assembly next May.

Non-Sectarian Education We have often, of late, had occasion to recognize and admire the editorial strength and courage of *The Churchman*, which does not hesitate, if occasion calls, even to criticise the distinguished bishop of the diocese of New York. Once more we observe an admirable and unexpected utterance on the English educational crisis. It supports the American principle as to public schools, and in doing this favors the position and demands of the British Nonconformists and opposes that of the bishops, archbishops and the entire Church of England. It says:

"A settlement of the education question which violates public opinion will do the Church of England far more enduring harm than can be balanced by the superficial victory of retaining partial control of the school system of England. It has already become a question of plain ethical bearing whether a religious education which does not harmonize with the acknowl-

edged maxims of social justice is not by that very fact incapable of giving a Christian training worthy of the name. The Church of England schools under the so-called Settlement of 1902 are 'maintained' by public taxation. They are, on the other hand, controlled by bodies of managers and taught by a staff of teachers over whose appointment a citizen as such has no control. If this is not a distinct violation of the recognized principles of modern democratic government, we do not know what it is."

Dr. Horton could not have said that more vigorously. *The Churchman* adds:

"The American view of education is that it is the business of the State to train citizens, and of the Church to train Christians. And such it will continue to be as long as this country is true to her past and to democratic ideals."

Exactly. We are very glad to see that sound and brave doctrine preached in just that quarter. We must depend on the family and the Church to teach religion. We cannot, and should not trust or ask the State to do the business of the Church and the family.

Daughters of the Confederacy We cannot expect those who fought for a lost cause easily to recognize that it was a wrong cause. It is too much to ask the veterans of the Confederacy to accept the sentiment of a young Southerner that theirs was "a blamed good fight in a blamed bad cause;" but it is unfortunate when the teaching is carried on to the next generation of Daughters of the Confederacy. At the last meeting of this organization Bishop Capers, formerly Brigadier-General, offered this prayer:

"We humbly thank Thee, Almighty Father, for the past history of our country, and for the inspiring reflection that, notwithstanding the disappointments and sorrows of our Confederate history, we came through its great trial and struggle with our battered shields pure, our character untarnished, and nothing to regret in our faithful defense of the honor and rights of our Southland."

We are thankful that those "rights" are now so far academic that no one would try to recover them. The Texas Daughters had a grand, good time at their meeting two weeks ago in Houston. Their chief amusement was in chuckling over the approval which President Roosevelt has given to secession, and they thus expressed themselves:

"Whereas, The President of the United States, by his recent course toward the Republic of Panama, has shown to the world his indorsement of the principle of the right of secession; and,

"Whereas, The people of the Northern States, by their acceptance and approval of his course, have shown that they have been led by him out of the fog of ignorance to the bright realms of truth, attained by the Southern statesmen so many years ago; be it

"Resolved, That we extend to the President the hearty thanks of the Daughters of the Confederacy of the State of Texas, in convention assembled, for his indorsement of the principles and his vindication of the cause for which the Southern people fought so gloriously, but so disastrously, in the war between the States."

We are glad they enjoyed their little joke; we only regret that they know so little of history as to parallel the right of Panama to secede with that of the Confederate States. Circumstances alter cases, and so does success.

A Northern Example We have no right to object if some people take every little opportunity to seem to prove that the color line is drawn at the North as well as in the South. Every Southern paper we have seen has had a delighted editorial on the report that in Sheffield, Mass., a separate school has been set up for the colored children. If Massachusetts is to have Jim Crow schools, why should not we have Jim Crow cars? The facts are these: The primary school in the center of Sheffield was overcrowded, and the Superintendent of Schools and the School Board made the mistake of trying to relieve the evil by assigning the colored children to another building in a convenient quarter. A well qualified colored girl was appointed teacher, but when she went to open the school not a scholar came. This ought to have been anticipated, but people in one social rank seldom appreciate that those of another rank have the same self-respect as do they. Had a separate school been assigned to Irish or German children not one would have appeared. The School Board then ordered all the children of the lower grades, white or black, to the new school. Then the white children failed to attend, the parents, it is said, objecting, not to the two colors being educated together, but to their being

under a colored teacher. So the case now stands, but will probably be settled, possibly by a change of teachers. The School Board learned something as to the demand of the negroes for equal treatment, while it is evident that a shadow remains of the old sentiment which years ago drove Miss Crandall's negro school out of Connecticut.

The annual Nobel Peace prize worth \$39,150, has been awarded this year to William R. Cremer, M.P., publisher of *The Arbitrator*, for his work in behalf of international arbitration. Mr. Cremer has been for thirty years Secretary of the International Arbitration League, and has traveled much on both continents in its interests. It occurs to us that there are several men in this country who might be proper candidates for this prize, if their names were presented, for we have had peace conferences and peace societies here ever since we can remember, and The Hague Tribunal is due to American zeal, and that goes back to a New York law committee and the Mohonk Peace Conference. It would also seem as if Chile and Argentina might present some available candidates. The present prize in physics is divided between Becquerel and the two Curies for their work on radiation, while the Swede Arrhenius receives that for chemistry; the Dane Finsen the medical prize for heating with electric light, and Bjornsen properly receives the literary prize. Nineteen persons have been recognized in three years, not one from America. Perhaps no American has asked for it.

The military forces led by Colonel Younghusband, and penetrating the unknown regions of Tibet, may possibly do a very important piece of geographical work. We know Mount Everest, 29,000 feet high, as the loftiest mountain in the world; but there is a line of great mountains situated to the north of Mount Everest, which are called the Pherug range, visible from the northern passes of Nepal. These summits, if any, will dispute the supremacy of Everest, "the Lord of Snows." The Tibetan natives declare that these northern mountains are much higher than the Everest range, but native estimates in matters of heights

cannot be relied on, and are apt rather to refer to the passes than to the peaks that overhang them.

A strong committee has been appointed in this city to solicit and receive contributions for the sufferers in Macedonia. It includes such men as Mayor Low, Bishop Potter, Bishop Andrews, Dr. Parkhurst, Dr. John P. Peters, Dr. Burrell, Dr. MacArthur, Morris K. Jessup, John S. Kennedy and Everett P. Wheeler. The Trust Company of America, 149 Broadway, receive contributions in this city, and Kidder, Peabody & Co. in Boston. We are glad to see that *The Christian Herald*, which has done so much good work for the Armenians and for the famine sufferers in India, is taking a fresh interest in this call. It is one that ought to secure contributions from both churches and individuals.

On a late Sunday, so the story comes to us, a leading Baptist church in Syracuse, N. Y., being without a pastor, asked the Chancellor of the Syracuse University, a Methodist, not a Baptist, to conduct for them their communion service. We have heard no complaint about it; we shall hear none of any account. That church will not be disfellowshipped by the neighboring Baptist churches. Such a crossing of the lines for such a service could not have occurred twenty years ago. It shows how much more Christian our Christianity is becoming. It is a milestone on the road to Church unity.

Dr. Newman Smyth, of New Haven, has published a fairly fair epitome of the facts of current history as to the action of the United States in the Panama matter. He makes no comment beyond the question, "What next?" We think our Government could stand on that record, which shows clearly that we were under no obligation to protect the rights of Colombia against domestic revolution, and that in case of a peaceful revolution we were under obligation to protect the Isthmus against the attempt to reconquer it.

In an address before the National Civil Service Reform League last week

Mr. Schurz called attention to the fact that all the men implicated in the Post Office frauds were specially appointed and did not get their place through competitive examination. This is interesting, because the spoilsmen's claim is that officers under bond must be allowed to select their confidential assistants. These guilty officials were all of this confidential sort.

Mr. Carnegie has the right view as to the restriction of immigration, and he put the case with Scotch sense in an address before an Educational Alliance last Sunday. The best proof, said he, that a man is worthy of us is that he has the ambition to come here to better his condition and that he has saved money enough to get here. It is the language a man speaks, he says, that determines his race, for national purposes, and "it is astonishing how soon a foreigner who comes to this country is born again."

The census taken every little while of church attendance in this city is not so enlightening as it might be. It counts the people, mostly adults, in the morning or morning and evening services, and does not count the children in the Sunday schools, where there are very nearly as many as in the pews. Add to these the people who are necessarily detained, and the figures are by no means disheartening.

We most heartily hope that Congress will do something more for public parks, and especially for the possession and preservation of the Calaveras big trees of California. They are the finest and most accessible in the State; they belong to private individuals and are in danger of destruction.

The Lily White organization in Louisiana appears to be collapsing, and its members are going back to the Democratic Party. That is just where they belong. They were a damage to the nobler principles of the party so long as they were in it, and were in it solely for office and business. Let them go.

Insurance

Insurance of Hungarian Workmen

WORKMEN'S insurance against sickness, according to *Public Opinion*, is obligatory in Hungary. Certain laws in regard to the insurance of Hungarian workmen against sickness were passed in 1891, and the enactment of others followed in 1900. By means of these laws a fund for agricultural workmen was created. The laws of 1891 established obligatory insurance against sickness on the part of workmen in general, but made the choice on their part among several funds, such as construction funds, corporation funds, district funds, factory funds, society funds, etc., elective. There are other interesting details that merit consideration and study in the acts of 1900. Under the laws of Hungary the employers are obliged to annually contribute 120 hellers per workman, while the state provides a fixed subsidy yearly that reaches a total of 250,000 crowns. An insurance in case of death is further provided that ranges from 60 to 200 crowns, as well as an annuity of from 65 to 215 crowns annually, according to the term of membership.

Hungarian statistics regarding insurance against sickness that have recently been made available to the public show a substantial increase in the number of policy holders, which, at last accounts, had reached a total of 637,343 persons. The expenditures of the various funds covered the following items—viz., pecuniary indemnities, medical attendance, hospital expenses and funeral expenses. Nearly a quarter of a million patients were treated during the year covered by the report under consideration.

The Peril of the Street

THE *Evening Post* prints a list of 125 accidents that took place in New York City from October 27th to November 9th, inclusive. From this list it appears that to cross a New York City street is to encounter the peril of the horse car, the cab, the express wagon, the truck, the coach, the automobile, the bicycle, and the runaway, without mentioning the hazard of falling bricks and the like, and

other perils from whence come accidents and too frequently death. Too many drivers, according to the *Post*, are under age, and one has only to stand at the crossing of any busy thoroughfare to note confirmation of much of what our contemporary states. It is again by no means likely that street accidents are limited to New York City. They occur in all cities throughout the length and breadth of this great country of ours. It is staggering when one stops to consider the multiplicity of accidents, not that may happen, but which do happen. No one is safe for a moment either at home or abroad. So long as it is a condition and not a theory that particularly confronts those who use the streets, whether they be young or old, it will be apparent that an accident policy is a very desirable fortification against the peril of the street.

THE fall of an asbestos curtain at the Girard Avenue Theater, in Philadelphia last October, just when the fire department of that city were getting the fire under control, allowed the flames to spread to the auditorium of the playhouse with disastrous results. The asbestos curtain has hitherto been relied upon as an almost absolute protection against the spread of flames in theater fires, but the Philadelphia incident has developed a new hazard problem connected with the supports of asbestos curtains with which the underwriters must now concern themselves.

... *Insurance* of December 4th prints the following paragraph:

"Fires start in many strange ways, but a very curious explanation of one was recently given by a carpenter the other day, whose house caught fire while no one was in it. He said that he believed it was caused by the fumes from a small uncorked bottle of oxalic acid, coming in contact with wood near which it stood. Will somebody give an opinion?"

In answer to this it may be said that the statement made regarding oxalic acid is quite absurd. Oxalic acid is a white solid, gives off no fumes and would not attack wood if it were in contact with it for a thousand years.

Financial

Secretary Snaw's Report

THE figures in Secretary Shaw's annual report emphasize the need of economy. For the year ending with June last the excess of receipts over expenditures was \$54,297,000; it is estimated that the surplus at the end of the current fiscal year will be only \$14,000,000, and the Secretary foresees at the end of next year a deficit of \$23,000,000. This year the receipts have fallen off, notably at the custom houses; but the expenditures are increasing. Next year's estimates show receipts exceeding those of last year by only \$10,000,000, but expenditures enlarged from last year's \$640,000,000, and the present year's \$660,000,000, to the great total of \$727,500,000. The prevailing opinion in the country, and a just one, will be that appropriations for so large an outgo ought not to be made. Undoubtedly the influence of Speaker Cannon will be exerted to keep them within reasonable limits.

It is probably owing to the policy of the Republican leaders that the Secretary's report this year contains no recommendations for increasing the circulation by the issue of national bank notes on the security of assets or commercial credits. For some time it has been understood that there will be no currency legislation at the present session. One year ago Secretary Shaw argued forcibly and at considerable length in favor of a circulation based in part on assets, showing that the safety of it would be beyond question, as "the lowest tax suggested by any one would far exceed any possible loss." This year he speaks very briefly of the lack of elasticity as an "admitted defect" that "should be remedied," dismissing the subject with the safe remark that "in remedying it no measure should be considered that will in any wise weaken that which is now stable, and no element should be injected that will cause distrust and doubt." In the Comptroller's report Mr. Ridgely goes a little further, briefly repeating his last year's recommendation "that the national banks be allowed to issue a portion of their notes uncovered by the deposit of bonds," which, he says, "seems the most simple and practical, as well as the safest, way to introduce some

elasticity into our banknote circulation." In our opinion, Congress at the present session ought at least to authorize the Secretary to deposit the customs receipts in the banks, and to encourage the banks to take out circulation by permitting them to retire it at will, without the restrictions now imposed.

MEXICO is to have a Stock Exchange. The entrance fee will be \$500, and subscriptions for 400 seats have been obtained.

....Our exports of agricultural implements in the last fiscal year were \$21,000,000, against only \$4,500,000 ten years ago.

....Thirty-nine railroad companies, replying to inquiry, have recently reported that the total number of their registered stockholders is 191,387. These companies have a little more than half of the entire track mileage.

....An American company has obtained a contract for sixty electric elevators to be used on the Baker Street and Waterloo division of the London Underground Railway.

....The Prussian steel syndicate, embracing all the prominent manufacturers, has been renewed for five years in the form of a stock company which is to handle the entire product. To each member will be allotted a fixed percentage of the output.

....The Western Union Telegraph Company's statement, issued with the declaration of the customary quarterly dividend, shows that the surplus of \$13,863,602, on October 1st, will be increased (receipts partly estimated) on January 1st to \$14,510,285.

....Dividends announced:

Commercial Cable Co., 2 per cent., payable January 2d.

Chicago, Grt. West. R'way Co., 4 per cent. Debenture, \$2.00 per share, payable January 15th.

Mergenthaler Linotype Co., 2½ per cent. quarterly and 5 per cent. extra, payable December 31st.

Western Union Tel. Co., 1¼ per cent., payable January 15th.

International Silver Co., Preferred, 1 per cent., payable January 1st.

Metropolitan Trust Co., 8 per cent., payable January 2d.

The Independent

VOL. LV NEW YORK, THURSDAY, DECEMBER 24, 1903 No 2873

Survey of the World

The Panama Question

Owing to the speech made last week by Senator Hoar and the recent action of the Senate Democratic caucus, the ratification of the Panama Canal treaty may be defeated. The caucus adopted a resolution providing that hereafter its decisions, "when made by a two-thirds majority, shall be binding on all the members," except when pledges have previously been made to constituents, or instructions have been received from a Legislature, or a question of constitutional construction is involved. The 57 Republicans cannot ratify a treaty without the aid of Democratic votes; under this caucus resolution the action of the 33 Democrats may be controlled by 22 of them. Before Mr. Hoar's speech it was understood that about a dozen Democrats would vote for the treaty or were inclined to do so. That speech, the following speech of Mr. Gorman, and the action of the caucus have had the effect, it is said, of bringing the Democrats together in opposition to the treaty. It is reported in Washington that the Republicans, if the treaty should be rejected, would move to reconsider and thus keep the treaty before the Senate, so that the question would be an unsettled one throughout next year's campaign. Rumors are published to the effect that the expediency of annexing Panama by joint resolution (if Panama should ask for annexation) has been considered by some politicians.—Mr. Hoar spoke in support of his resolution of inquiry, on the 17th, and his attitude toward the action of the Government was at once seen to be that of a hostile critic. He was anxious, he said, that the canal should be built, and built by the present Government, but he was more anxious that it should be built

"without taint or suspicion of national dishonor." The bearing of his remarks was that on the information already sent to Congress the course of the Government had been discreditable, altho he expressed the opinion that the President was incapable of intrigue and indirection. What he said, however, amounted to a denunciation of the instructions given to Admiral Glass on the day before the revolt, and of the action taken to prevent Colombia from suppressing the revolution. The revolution, he said, was known at Washington before it was known on the Isthmus. Our action, he asserted, was equivalent to an act of war against Colombia. "Do we claim," he asked, "that every South American nation holds its property subject to our right of eminent domain?" He spoke at considerable length and with much emphasis. Mr. Gorman promptly seized the opportunity to congratulate him and to make a bitter attack upon the President, whom he likened to Napoleon. When Mr. Aldrich asked whether the Democrats would defeat the treaty, he replied that upon the information thus far received the transaction was an objectionable one and he could not sustain the President. He suggested that in seeking political success in a time of depression the Government had thought it expedient to excite a war. Mr. Foraker said he had been shocked by Mr. Hoar's speech, which, if made at all, should have been made in executive session. The country, he thought, would be surprised. He defended the action of the Government. Mr. Morgan introduced a resolution declaring that the action of the President amounted to an act of war, and that the President had thus wrongfully assumed the authority of Congress. Mr. Gorman

moved to reconsider the confirmation of Mr. Buchanan's nomination to be Minister to Panama. On this account Mr. Buchanan will have no authority when he arrives at Colon.—During the Senate debate the remarks made at a banquet in New York last week by Assistant Secretary Loomis were severely criticised by the Democrats. Mr. Loomis, defending the course of the Government, said that if we had waited a year for Colombia to negotiate a new treaty and to cancel the French Company's concession, France would not have serenely witnessed such treatment of her citizens, but would have sent a squadron, landed marines at Colon, and occupied the line of the canal. Then we should have viewed France with keen apprehension. The situation, he asserted, was fraught with real and momentous dangers. "French war ships might easily have been followed by those of England and Holland; and Panama, like the Balkan States, might well have been expected to furnish the spark to set half the world in flames." Therefore it was fortunate that "there was in Washington a man who possessed the insight, the knowledge, the spirit, and the courage to strike a blow, the results of which can be fraught only with peace and good to the whole world." Mr. Loomis also said:

"One of the most significant and valuable results of our action in respect to Panama will be the wholesome object lesson and the enduring moral effect which our supremacy on the Isthmus will bring to the eyes of certain people who are in sore need of instruction in the practice of peaceful pursuits and orderly administration. It also would be not without value for these same people clearly to understand in dealing with the United States that there is a limit to the patience and forbearance of this Government. Some of the Latin-American countries have presumed upon their smallness and feebleness to do certain things and to assume certain unpardonable attitudes which we would not for a moment tolerate on the part of larger or more responsible nations."

The President has warmly congratulated Mr. Loomis upon the character of his speech.—Additional correspondence sent to Congress shows that on June 9th Secretary Hay instructed Minister Beaupré at Bogota to intimate to the Colombian Minister of Foreign Affairs that if the treaty should be defeated or unnecessarily delayed, "the friendly understand-

ing between the two countries would be seriously compromised," and that the action of Congress in the following winter "might be such that every friend of Colombia would regret it." This was regarded by the Colombian Senate as a threat. It also appears that the Colombian who, on November 6th, told Mr. Beaupré that if the United States would uphold Colombian sovereignty on the Isthmus, the Government would declare martial law and ratify the treaty by decree, was General Reyes, now in Washington, and recently elected President. Some weeks earlier General Reyes had informed Mr. Beaupré that the treaty would not be ratified unless it should provide for the payment to Colombia of \$10,000,000 out of the \$40,000,000 which the French Company was to receive, and for an increase of our payment from \$10,000,000 to \$15,000,000.

The Situation on the Isthmus

At last reports, the Colombian troops sent to a point near the boundary of the new republic were only 60 miles from the American marines, who have been stationed at Yaviza, to prevent an invasion. On the 15th, the "Atlanta" found 500 Colombian soldiers encamped at Titumari, on the west side of the Gulf of Darien and north of the mouth of the Atrato River. To an officer who went ashore, General Ortiz, their commander, made energetic protest, both in conversation and in writing, against the presence of our war ships in Colombian waters, and demanded that the "Atlanta" should at once depart. It appears that this camp serves as a base of supplies, and it is believed that the purpose of the Colombians is to make their way over the mountain range to the stream that flows into the bay of San Miguel, on the Pacific Coast, and to the neighborhood of Yaviza. At that place and at another point ten miles away there have been stationed 200 marines and 100 Panama soldiers. Another party of marines has been placed at a point near the boundary on the Atlantic side. It was reported on the 19th that a Colombian ship bearing 500 soldiers had sailed northward, probably to an island off the coast of Nicara-

gua, which is claimed by Colombia, and is not far from the upper boundary of Panama. General Reyes has assured the State Department that there will be no invasion of the Isthmus while he remains in Washington. His statement, asking for a submission of the controversy to The Hague Court, has not yet been received by Secretary Hay. The Colombian committee in Paris talks of war, and professes to rely upon the aid of other South American countries. Peru has recognized the new republic. It is understood that Minister Bunau-Varilla is now inclined to consent that one-third of the \$10,000,000 which Panama is to receive shall be paid to Colombia, upon condition that the money shall be used to discharge a part of her foreign debt.

Reciprocity with Cuba at Last

On the 16th inst., the bill making the Cuban Reciprocity treaty effective was passed in the Senate by a vote of 57 to 18, nine Democrats (Messrs. Gorman, Cockrell, Stone, Bacon, Clay, Blackburn, McCreary, Overman and Simmons) joining the Republicans in the affirmative, and one Republican (Mr. Bard) voting in the negative. The President signed the treaty on the following day, and issued a proclamation, announcing that the agreement would go into effect on the 27th. Great Britain has given formal notice that, under the "most favored nation" clause of existing treaties, she expects that sugar from the British West Indies will be admitted at our ports at the rates of duty provided in this treaty for Cuban sugar. Similar notice will probably be given by Germany and France, with respect to their beet sugar. The Cuban Congress intends to increase some of the duties of the present Cuban tariff before the 27th.—A sharp debate preceded the final vote in the Senate. Mr. Bailey made an elaborate argument designed to prove that the treaty and bill were unconstitutional, upon the ground that all measures so affecting the revenues should originate in the House. The President, he asserted, had been guilty of "insolent usurpation" of the privilege of that body. His remarks appeared to be in part an indirect attack

upon Mr. Gorman and other Democrats who supported the bill. "Hereafter you'll get no White House Senators from this side," said he to the Republicans, referring to the recent caucus action of the Democratic Senators. Mr. Spooner defended the constitutionality of the measure, and opposed Mr. Bailey's contention that the chief beneficiaries of the treaty would be the Sugar and Tobacco Trusts. Incidentally he remarked that in his opinion the United States owned the Isle of Pines. Mr. Hoar said the policy of modifying the tariff by treaties did not have his approval, and that he did not regard with favor the President's statement that a failure to pass the bill would amount almost to a breach of faith.

Postal and Other Frauds

The charges made some months ago by Seymour W. Tulloch, relating to the Post Office Department, are sustained in a report prepared by Charles J. Bonaparte and Holmes Conrad, counsel for the Government, who were appointed by the President to review them. For the fraudulent employment of persons in connection with the Washington Post Office and elsewhere, the report finds that First Assistant Postmaster-General Perry S. Heath and George W. Beavers (now under indictment) were directly and primarily responsible, and that the responsibility was shared by Postmaster-General Charles Emory Smith, Auditor Castle, Comptroller Tracewell, Postmaster Merritt, of Washington, and his predecessor, the late Mr. Willett; by the postmasters, because they tolerated these abuses and obeyed improper orders; by the Auditor and the Comptroller, because their lax administration permitted the payment of illegal claims; and by Mr. Smith, because, notwithstanding repeated warnings, he failed to appreciate the gravity of the misconduct of his subordinates and the necessity for the punishment of them. The statute of limitations prevents prosecution on account of the offenses in question, which were "often illegal and may have been sometimes criminal." The report severely criticises the conduct of Mr. Heath, as to whom

it is said that the evidence presents a strong *prima facie* case of willful and reckless disregard of statutory obligations, and must inevitably excite "suspicion of his personal integrity." In addition to the payments illegally made to persons who performed no service, there was paid to Beavers \$1,148, as to which the report says that Heath, Beavers and Postmaster Van Cott, of New York, must have known that the payment was expressly forbidden by law. The transfer (with reduction of salary) of Thomas W. Gilmer by Frank A. Vanderlip, Acting Secretary of the Treasury (now a bank officer in New York), is said to have been "apparently unjust and oppressive, and certainly disastrous to the public interest." This action would "naturally be understood as a punishment inflicted on a faithful public servant, who had by the honest discharge of his duty incurred the enmity of active and influential politicians." Gilmer had been engaged in an inquiry as to the abuses for which Heath, Beavers and others were responsible. The report says this case would call for an investigation of Mr. Vanderlip's conduct "were he still in the public service." A thorough investigation of the Washington and New York post offices, and of the administration of the First Assistant's office during the last three years, is recommended. Among the letters accompanying the report is one in which Secretary Shaw remarks that Comptroller Tracewell, by an error of judgment, passed a few improper payments, and should be exonerated. He went over the whole matter with Gilmer, he says, and became convinced that Gilmer "was seeking to embarrass the Department and his former chief."—The full report of Mr. Bristow on the postal service frauds having been given to the press, additional details relating to the offenses mentioned in the original summary are published. There is much testimony as to an alleged gift of \$20,000 in stock to Heath from persons supplying the machines in connection with the sale of which State Senator Green, of New York, committed the offenses for which he has been indicted. Weis, who represented the promotion syndicate in the New York office, col-

lected about \$10,000 from clerks and paid two-thirds of the money to an intimate friend of Beavers. Several clerks testified that they received the promotions for which their money had been paid.—United States Senator Dietrich was indicted again, last week, at Omaha, upon evidence relating to the leasing of a building for a post office. State Senator Lowe was indicted for receiving from a postmaster, named Mitchell, \$1,000, paid for the exercise of his influence with Senator Dietrich in behalf of Mitchell's appointment.—An important arrest has been made by the officers who are pursuing the land thieves. John A. Benson, of San Francisco, a millionaire, who is said to be the chief figure in a conspiracy by which the Government has been robbed of land worth several millions of dollars, came to Washington and was arrested there for bribery. It is alleged that he has been accustomed to obtain valuable information as to the purpose of the Government concerning forest reserves by corrupting employees of the Land Office. He was prosecuted for similar frauds in 1885, and acquitted. Having been arrested on fresh charges, he forfeited his bail, left the country, and remained in Denmark for several years.—A recent decision of the Missouri Supreme Court affects the legality of hundreds of arrests and many convictions in connection with Attorney Folk's campaign against bribers and the bribed in St. Louis. It is reported that in several important cases the convictions must be canceled, and that the statute of limitations will prevent the finding of new indictments.

Purchase of the Friars' Lands The prolonged negotiations concerning the lands of the religious orders, or friars, in the Philippines were ended last week, when an agreement was reached for the sale of the property to the Philippine Government. Governor Taft had offered \$6,000,000; the friars' price was \$15,000,000; the sum to be paid is \$7,250,000. There are 403,000 acres, including all the agricultural lands and holdings of the friars, except one sugar plantation and a tract of 12,000 acres, near Manila, which has been sold to a

railroad company. The agreement has been approved by the Pope, who remarked when the news was brought to him: "This is the best Christmas box I could have had." It is said that nearly all the purchase money will be deposited at Manila and be used for the support of the Church in the islands. The policy of the Government will be to sell the lands to the present tenants on easy terms, and thus to make as many land owners as possible. Not more than 200 of the friars remain in the islands, and nearly all of these are in Manila. All the Franciscans, it is said, will leave the islands; a few of the Recollets will remain; the Dominicans will be cared for by their University, and the Augustinians will again occupy their building at Iloilo, which is now used by American soldiers. There they will conduct a school. It is expected that hereafter no members of these orders will be sent to the Philippines.

Santo Domingo Santo Domingo refuses to remain pacified. No sooner had the revolution, a week or two ago, overthrown President Wos y Gil and his administration and elevated General Morales to the provisional dictatorship, with the idea of eventually putting ex-President Jimenes back in the presidency, when a revolution starts against the revolution. Now the whole insurrection business will doubtless be done over again. Morales is already barricading the capital city of San Domingo, and the insurgents are gathering in the provinces and preparing to converge on the capital. The situation is as bad as can be, and even United States Minister Powell's life has been in danger, so the cable dispatches say. It seems he has been so "unpurchasable" and so importunate in safeguarding the rights and claims of the United States, that the Santo Dominican leaders thought he ought to have a successor who would be more pliable in their hands. Accordingly, a plot was hatched whereby a street fight would take place when Minister Powell was walking abroad, and in the ensuing *mêlée* he should "accidentally" be shot. At the present writing this plot story has not been officially confirmed. It is now freely prophesied by certain

influential Santo Dominicans that the United States will have to declare a protectorate over Santo Domingo if things do not improve. Senator Heyburn of Idaho, moreover, has introduced a resolution into the Senate requesting President Roosevelt to acquire by annexation the island of Santo Domingo, including the republics of Santo Domingo and Hayti.

British Politics

The present Conservative Cabinet is being attacked on three distinct lines, the conduct of the war, the new education law and the tariff proposals. The report of the Royal Commission revealed corruption and mismanagement similar to that exposed by the Crimean War of fifty years ago, and the Opposition insists on holding the Government as a whole responsible for the scandal instead of allowing one or two members of the Cabinet to be sacrificed to save the party. It is clearly shown that altho the Government was for a long time aware of the impending conflict it made no adequate preparation for fear of arousing public opinion, and the outbreak of hostilities found the army in as bad a condition in regard to supplies and campaign plans as the French army was in 1870. The "Non-conformist uprising" against the denominational control of the public schools shows no signs of abating, and their policy of passive resistance to the payment of school rates is obstinately pursued all over the country. The differential tariff plan of Joseph Chamberlain, altho the Government refuses to assume complete responsibility for it, has become the dominant issue in the election campaigns, and is meeting with more favor than was at first thought. In the elections in the borough of Lewisham and the Dulwich division of Camberwell, which were fought chiefly on the Chamberlain proposals, Conservative candidates were returned by majorities only slightly less than the ordinary Conservative majorities in these precincts. The Tariff Reform League has selected a non-partisan commission of experts to inquire into the condition of British trade and frame a model tariff law. All the important commercial interests of England and the colonies are represented on this commission, which

includes also such men as Charles Booth, whose volumes on "Life and Labor in London" contain the most complete study made of the poorer classes of any country, and Alfred Mosely, who has conducted commissions to the United States to study our educational and manufacturing methods. The secretary of the commission will be Prof. W. A. S. Hewins, director of the London School of Economics and Political Science. In a speech at Leeds, Mr. Chamberlain used the following language:

"Whenever the country is ready to give us the mandate we ask and there is a Government in power prepared to accept our principles, we will have ready all or most of the information that it will desire, and it will have before it a tariff which has been presented to the country, and upon which the people have had every opportunity for expressing their opinion.

"We, like the United States, have community of race, community of interests, common patriotism and common sentiment. Yet the United States has got something we lack. She has got a common Constitution, a common system of defence and a common commercial bond. Why should not we have these, too? It is our business to try to secure them."

France The Premier, M. Combes, has taken the next step in the war against the church schools by introducing a bill forbidding all teaching by the religious orders, even those which are authorized under the present law. The property of the congregations used for educational purposes will be taken over by the State, and the schools of France will be secularized from the elementary to the University of Paris. If the proposed policy is carried out over two thousand schools for boys and girls will be closed, and the first cost to the nation is estimated to be some \$5,000,000, and will constitute a heavy drain on the already overburdened budget. This extension of the public school system is to be made gradually in the course of five years. The law requiring authorization by the State of all schools under the control of the religious orders is being interpreted in the sense which allows the Government to refuse such authorization to any particular institutions at will. Among the schools which have been closed under this law is the Benedictine College

at Douai, which is entirely a British institution, and admits no French boys, and has none but English masters. The property of this college, which was founded before the Revolution and has been built and supported by English money, has been taken possession of by a Government official.—In France less attention is paid to scientific progress by the general public than in this country, and little has been popularly known of the remarkable series of discoveries of the new forms of radiation discovered by Mr. and Madame Curie and Mr. Becquerel until the awarding of the Nobel prize to them for the most important work done in physics. Now, however, national pride has been aroused, and gifts are being made to defray the great expense of carrying on the researches with radium, in order that French scientists may hold the honorable position they have attained in this field. A Paris newspaper, *Le Matin*, has opened a subscription for M. d'Arsonval, a member of the Institute and College of France, to prosecute this work, and has headed the list with \$6,000.—The Dreyfus Commission will meet this week to receive the report on the examination of the new papers in this case. It is the general belief that he will be speedily cleared, and the papers are already speculating about which regiment he is to be assigned to as colonel. Whether a new court martial will be necessary after the Court of Cassation has passed upon the case is a perplexing legal point.

The Kaiser and the Army The exposure of the immorality of garrison life made in the guise of fiction by Lieutenant Bilse has forced the resignation of some prominent officers and the Emperor is said to have issued secret orders on the subject, the copies of which are to be read by the higher officers of each army corps and then returned to the general staff without copying. The officers of the Guard Corps have been ordered to examine the men for wounds in order to detect cases of cruel treatment. One corporal has been sentenced to five years' imprisonment on being found guilty of 1,600 in-

stances of brutality inflicted by him on privates. An officer in Metz has 1,000 complaints against him for cruelty. All this furnishes abundance of material to the Socialists for their attack on the Government. Herr Bebel talks freely in the Reichstag of the greater freedom of speech and association possessed by the people in republics, such as the United States, Switzerland and France. In reply Chancellor von Bulow quoted a letter written by Herbert Spencer shortly before his death to a French friend, in which the famous philosopher said that, as the result of his eighty years of observation, it was his belief that the triumph of socialism would be the greatest disaster that could befall civilization, and that, if it triumphed, it would soon be displaced by a military dictatorship. "I do not believe that socialism will triumph," said the Chancellor, "and I am convinced that the common sense of the German people, the solidity of our institutions, the patriotism of all civil parties, and the intelligence and decision of the crown and its advisers will ward off such a disaster. But if you should succeed, then there would happen what Herbert Spencer predicted, and the present order of things would give place to a most savage and brutal *régime* of the sword." —The rumors of the serious nature of the injury to the Emperor's throat seem to be unfounded. At the hundredth anniversary of the formation of the Hanoverian regiments he toasted, with his usual firm and distinct voice, the German legions which, in conjunction with Blücher and the Prussians, rescued the British army from destruction. The English papers are making loud protests against this interpretation of history and exaggeration of the part played by German troops in that crisis.

The Alexandretta Incident

United States Consul W. R. Davis is being conveyed from Beirut back to Alexandretta on the protected cruiser "San Francisco." The Turkish Government has instructed the Governor at Alexandretta to meet the Consul with suitable honors and apologize to him for the indignity offered. According to the Turkish Minister at Washington,

Chekib Bey, the vigorous way in which Consul Davis chastised five of the police with his cane demanded some explanation also, but it was held by our State Department that he had done no more than his duty in the case. Attarian, the Syrian and naturalized American, who was prevented from embarking even when under convoy of the Consul, has declined the transportation offered him by the Turkish Government until the \$2,500, which he had on his person when arrested, is returned to him.

Entering Tibet The British expedition has penetrated into Tibet with no military opposition so far, and the difficulties of taking a force of over four thousand men with guns and supplies over Jelep Pass at an altitude of 14,380 feet, with the temperature below zero, have been overcome with surprising success. The Mission is in charge of Colonel Younghusband, renowned for his explorations in this "roof of the world" many years ago, and the troops are in part English, but more largely composed of veteran Pioneer Sikhs, who carry pickaxes and shovels as well as arms, and are equally good at fighting and road making. Nepalese and Indian bullocks transport the supplies, and the soldiers have been furnished with the fur coats provided for the British troops in China in the winter of 1900-1901. The British advance is north of Darjiling, between Sikkim and Bhutan, both of which are under English control, and through the Chumbi Valley to Giangze Jong, one of the best cultivated portions of Tibet within 150 miles of the holy city of Lhasa. The Dalai Lama has returned the letters addressed to him by Lord Curzon, the Viceroy of India, and the ostensible object of the British Mission is to establish direct diplomatic and trade relations with Tibet, which, being nominally under the suzerainty of China, has hitherto carried on its negotiations only through Peking. Recently, however, the Dalai Lama has exchanged gifts directly with the Czar of Russia, and the British are determined that if there is to be any "open door" to Tibet it shall be toward the south rather than toward the north.

Lhasa, the
Sealed City

It is an interesting revelation of national characteristics to contrast the English and Russian methods for reaching this most inaccessible city in the world. The English are now forcing their way through and over the highest mountains in the world in the dead of winter to gain by means of Maxims and eight-pounders an influence in Tibet equal to that recently attained by Russia through some very skillful diplomatic work by Buddhist priests. Tsybikoff, a Russian Buriat by birth and educated at a Russian university, has recently returned from a year's residence in Lhasa and presented to the Russian Geographical Society the first scientific report on Central Tibet and its capital. He took three meteorological observations a day for 235 days without a break in the record, secured many fine photographs and obtained a collection of 317 volumes of Tibetan theological and scientific books written by distinguished lamas of the past nine centuries. The Russian Government sent to the Dalai Lama three hundred camel loads of presents, including some American rifles and a set of the vestments of a bishop of the Greek Church. According to Tsybikoff's observation the population of Tibet is not over two and half millions, but in the three monasteries there are 15,000 to 16,000 Buddhist monks as well as a large number of pilgrims. A Japanese Buddhist priest, Ekai Kawaguchi, also brings with him much interesting information from Lhasa, where he spent two years in study of the ancient Sanskrit and Tibetan texts of the Buddhist scriptures, and had several interviews with the Dalai Lama, the present incarnation of the Buddha, who is an intelligent young man of twenty-eight.

Japan and
Russia

Correspondents in the Far East respond but feebly to the demand for news from the seat of the prospective war, but the probability of a conflict is apparently increasing. The Russian proposals in reply to those which were submitted by Japan were considered in a Cabinet meeting lasting three hours, to which were invited the leading Japanese statesmen and military officers, such as Marquis Ito, Field Marshal Yamagata and Count

Inouyé, former Ambassador to Korea. The Russian proposals were rejected, but it is announced that no ultimatum was issued by Japan. Both parties express a willingness to continue the negotiations in the hope of a peaceful settlement, but at the same time active preparations for war are continuing in Manchuria and Japan. The Russian fleet in the Mediterranean, consisting of two battle ships, three cruisers and eleven torpedo boats, will leave for the Far East in a few days and Russian troops are moving night and day through Manchuria toward Port Arthur. United States Minister Allen has demanded a definite answer as to whether the Korean Government will open the port of Wiju on the Yalu River, opposite An Tung, which, according to the recent treaty between China and this country, is to be opened to commerce. Yongampho, where the Russians have been recently purchasing large tracts of land from the Koreans, is a port just south of the estuary of the Yalu. It was the encroachments of Russia here, in addition to her liberal interpretation of the concession to fell timber on the upper Yalu, which has so disturbed this "Land of the Morning Calm," and led to the belligerent attitude of Japan in defense of her own interests in the country. There has been some rioting at Mokphe, in which 17 Koreans were killed by a Japanese mob.

Zionists A young Russian revolutionist, named Louban, fired two shots at Max Nordau at a Zionist ball in Paris, but without seriously injuring him. The assailant was a Zionist of the stricter sort, and opposed to the plan advocated by Dr. Nordau of accepting the offer of the British Government to give to a Jewish colony a territory of 300 square miles in Uganda, East Africa. This is regarded by some Jews as an attempt to divert the Zionists from their ultimate aim of establishing an independent Jewish nation in Palestine. The marriage of Israel Zangwill with Miss Edith Ayrton, daughter of the English physicist, has caused many of the Zionists to lose confidence in him as a proper leader of the movement in England.

Prospects of Arbitration With England

BY JOHN W. FOSTER, LL.D.

EX-SECRETARY OF STATE

THE INDEPENDENT asks me: What are the prospects of another arbitration treaty between the United States and England? My general answer to this question is that I regard the prospect as quite favorable.

There are various reasons for this belief. In the first place, the relations between the two countries have materially changed for the better since the Olney-Pauncefote arbitration treaty by a close vote failed of approval by the Senate in 1897. The conduct of the British Government and the sympathies of the English people were so unmistakably friendly during the Spanish War in 1898 that even the Anglophobes in the United States relented in their hostility. The events of that year show that in any conflict with a foreign Power we are reasonably sure of the friendship of our kinsmen across the sea.

In 1897 the Clayton-Bulwer treaty, which had long been a source of disquietude between the two Governments, still stood as an obstacle to our independent action respecting the Isthmian Canal. With the benevolent acquiescence of Great Britain, we regained our freedom regarding this great enterprise in which our people are so deeply interested.

At the time of the failure of the Olney-Pauncefote treaty the controversy over the Alaskan boundary was prominently before the Senate and the country. There was a prevailing sentiment with us that this question was not a fit subject for arbitration. These two controversies doubtless had a marked influence on the action of the Senate. Their elimination, so happily effected, from our relations with Great Britain removes two serious obstacles to a dispassionate consideration by that body of an arbitration treaty.

In the past another sentiment has exerted an unfavorable influence upon the promotion of more harmonious relations with England. I refer to the Irish hostility to the British Government. A bet-

ter state of feeling has entered into Parliamentary politics, and its reflex influence has been salutary in the United States, where the Irish vote has been and continues an important factor.

The foregoing facts, I think, sustain the assertion that the relations between the two countries have materially changed for the better in the past six years. But there is still another fact which supports the belief that the present time is more propitious for securing an arbitration treaty than in 1897. The Hague Conference of 1899 was a notable event for the peace of the world, and the creation of The Hague tribunal has been a great stride in advance for international arbitration. The resort to it during the present year by almost all of the Governments of Europe and of three or more in America is a testimony to its utility that cannot fail to have a beneficial effect.

Another event having relation to the question propounded by THE INDEPENDENT remains to be mentioned. Altho the British Parliament and the Congress of the United States years ago declared themselves in favor of some general provision or convention for arbitration, and the effort was made in 1897 to bring this about, we have permitted France to take the lead of us and to enter into an arbitration treaty with England, her ancient and former inveterate enemy. It is mortifying to the friends of arbitration in the United States to note that our country has allowed a nation so alien in its racial and social relations to set us such a commendable example with our mother-country, to which we are bound by so many ties of kinship, language, religion and institutions. Such an event cannot fail to make the enactment of a treaty between the United States and Great Britain much more easy of accomplishment.

It is true that the Franco-British treaty is not so comprehensive as the advocates of arbitration in this country would desire for ourselves, but it is a

great step in the right direction. It is well known that under The Hague convention no nation adhering to it is required to resort to the tribunal created by that instrument. It is purely voluntary on the part of the nations whether or not they submit their controversies to it. The advance in the Franco-British treaty is that in a specified class of cases the parties obligate themselves to send them to The Hague when diplomacy fails. It would be desirable in a treaty between us and the British that its scope be enlarged as fully as the judgment of the Senate would permit.

In 1896 a conference of the friends of arbitration from all parts of the United States was held in Washington, notable both for the number and the representative character of the citizens who took part in it. Resolutions were adopted

urging upon the President and the Senate the making of a treaty of arbitration first with Great Britain, and that similar conventions be made with other Powers. Its action was followed by the Olney-Pauncefote treaty of 1897. That conference appointed a permanent National Committee. Its Executive Committee at a recent meeting in New York decided that the time was propitious for renewing efforts in favor of an arbitration treaty with Great Britain. They have accordingly called the National Committee to meet in Washington on January 12th next, and to this meeting they have likewise invited a number of representative citizens from various sections of the country, in order to concert measures to bring the subject anew to the attention of the United States Senate.

WASHINGTON, D. C.

The Year in Trade and Finance

BY FRANK D. ROOT.

AN almost uninterrupted decline of values, with a slight recovery in the closing month,—this has been the record of the year in the share market. Wages, increased in 1902 and in the early part of 1903, are now falling. Since the middle of the year, railroad earnings, gross and net, have shown a declining rate of increase over those of 1902. The pig iron output, rising from January by successive new records to the unprecedented quantity of 398,000 tons per week on June 1st, has fallen to 251,000 on December 1st, and even this reduced product more than supplies the demand. In the first half of the year the furnaces could not keep pace with the wants of consumers. In 1902 we made 17,821,000 tons; our actual product in the first half of 1903 was 9,707,000 tons; our output in the latter part of June was at the rate of 20,500,000 tons per annum; on December 1st it had fallen to the rate of 13,000,000. But even this was more than could be sold.

This decline of share values, with the accompanying evidence of reaction in

several important industries, has been unexpected and has seemed inexplicable to the majority, because crops have been abundant, the national Treasury was never so well supplied, the currency standard is not menaced, there has been no threat of complications with foreign nations, railroad traffic up to a recent date has been enormous, our foreign commerce has surpassed the record, and the volume of domestic trade has been large and of good character.

The following tables show the market prices of the leading railroad and industrial shares at the beginning of the year, on May 25th, on November 12th (which may be regarded as the lowest point for a majority of them), and on the latest available date:

May 25th—the first full day of trading on the Stock Exchange after President Cassatt, of the Pennsylvania Railroad, cut down and threw over his railway fences \$1,000,000 worth of Western Union telegraph poles and wire—was a day of great and depressing sales. If falling market prices occasionally made slight advances in the following six months, such brief upward movements were due mainly to the covering of "short" contracts. In the first week of December there were reports in the press that an agreement had been reached by the Pennsylvania railway interests, on the one hand, and the Rockefeller-Gould forces on the other, with reference to certain concessions at Pittsburg, Chicago and New York. These reports have not yet been confirmed. They relate to a quarrel as to the effect of which upon the share market and the industrial situation opinions differ.

At the beginning of the year, the market seemed to be quite strong. But the money stringency of the last quarter of the old year, the warning in Mr. Vanerlip's address (October 31st), the official disclosure of a low state of reserves, and the conditions which suggested the

loan pool of \$50,000,000 on December 15th, led the banks to take a very conservative course. Speculation for an advance was thus discouraged. The market soon became dull and narrow. In February the new publicity laws for corporations were enacted at Washington, and Judge Grosscup's decision against the Beef Trust was announced. These events, with the Coal Strike Commission's award, in March, and the decision in the Northern Securities case, on April 9th, were not approved by capitalists engaged in consolidating railroads and promoting Trust corporations by syndicates or otherwise. From the break which followed the Northern Securities decision, however, there was a considerable recovery; but the market soon became dull again.

There was life enough in it after Mr. Cassatt's attack upon the Western Union poles and wires. Sales on May 25th were 1,122,309 shares. Thereafter the market declined steadily, apparently under pressure and without any cause that could be seen in the general situation, except in the city building industry (which began in May to be affected by blackmailing strikes in New York), and in the cotton market, where wild speculation disturbed the mills. In July, a receiver for the Shipyard Trust was appointed, and the door was opened for those remarkable disclosures as to the methods of Trust syndicates and promotion which have not yet been completed. Values continued to fall; weakness was seen in the shares of the Pennsylvania Railroad and the Steel Corporation; great blocks of stock were thrown upon the market; rumors were heard that the Standard Oil multi-millionaires were engaged in a campaign of relentless depression. First-class securities were sacrificed for the protection of holdings of undigested and possibly indigestible industrial issues which the banks were unwilling to retain or accept as security for loans. On August 10th, a large majority of the active stocks were lower than on any other date since January 1st. The conservative *Financial Chronicle* remarked that there was "a vague fear of some potent agency working against values, which has not yet been fully disclosed or explained."

Observers began to ask whether this strange decline of shares would affect the condition of business throughout the country. Most of them could not understand why it should, in the face of large crops, heavy railroad traffic, prevailing peace, and general prosperity. They had yet to learn that the vast and complicated network of interests centering in the New York Stock Exchange and in New York's financial institutions, and extending thousands of miles from that city, cannot wholly escape when share values fall as they have fallen this year.

In September it began to be seen that the consumptive demand for iron and steel had been checked. General decline was hastened by this discovery. What were the causes of this unexpected change in the condition of the iron and steel trade, a change exerting great influence because the iron trade barometer, always carefully watched, had now become more sensitive and was more plainly to be seen, owing to the prominence of Steel Trust shares in the daily transactions of the Stock Exchange?

To the folly of labor unions in the building industry of New York and several other cities a part, but not all, of this change was due—unions ruled by such rascally leaders as Parks, who is now in the penitentiary. In New York alone these deluded workingmen compelled a long suspension of work upon \$90,000,000 worth of steel frame buildings and caused \$50,000,000 to be withheld from investment in similar structures. Adding the effect of strikes of the same kind elsewhere, one can easily see how the demand for steel was reduced. Failing demand depressed the market price of Steel Trust shares; other shares yielded in sympathy or because this seemed to be evidence of a decline of prosperity. Thus those who had been artificially depressing the market were assisted, and their task was made easier.

But the change in the iron trade was also due to other causes, one of them having been the prolonged decline of share values, temporarily or permanently embarrassing many persons and compelling them to give up or defer projects in which iron or steel would have been needed. Such embarrassment—the re-

sult of unsuccessful speculation or unfortunate investment—has been felt here and there all over the land by those who may be called capitalists of the middle class. For the absorption of the enormous current output of iron and steel the continued prosperity and ease of this class were necessary. This output had risen on June 1st, as has been shown, to the rate of 20,500,000 tons per annum, a quantity exceeding the combined outputs of Great Britain, Germany, France and Belgium in 1902. Labor strikes, with the restraint imposed by investment losses and the consequent impairment of credit, cut down the sales of steel, put out the fires in more than one-fourth of the iron furnaces, and caused the dividend on Steel Trust common shares to be reduced by one-half.

It was in October that this dividend was cut in two. At the beginning of the year the great Corporation announced that its net earnings for 1902 had been \$132,000,000; that out of this there remained a surplus of \$34,000,000 after the payment of fixed charges and dividends, and the setting aside of a large sum for depreciation and sinking funds; and that the orders on hand were for 5,347,213 tons of its products, against 4,497,749 tons one year earlier. On October 1st of the present year, however, the orders on hand were for only 3,728,000 tons. The price of common shares touched \$10 on November 10th, when the preferred were sold at \$49¾. Up to the present time these have been the lowest figures. The Corporation has undertaken to protect its 27,000 employees who, under the terms of its profit-sharing plan, took 49,000 shares of the preferred stock at \$82½.

The prices of certain steel products have recently been reduced by the Corporation or by the pools in which it exerts a controlling influence. But railroad rails have thus far remained at the combination price of \$28, altho sales for export have been made at prices that net not more than \$18 or \$19 at the mill, where American buyers must pay \$28 or get along without the goods. Attempting to make up in part by exports for the failing domestic demand, the combined manufacturers have induced the Eastern trunk lines to reduce by one-third the freight charges on rails from Pittsburg

to tidewater, but only on rails that are to be shipped to foreign countries.

In the last quarter of the year the depressing force of the decline of share values was keenly felt in Philadelphia, Pittsburg and some other cities, whose capitalists were constrained to join in the movement of general liquidation. Philadelphia suffered severely by reason of the unfortunate interest of many of her people in the Consolidated Lake Superior Company, a concern whose works and other properties are on the Canadian side of the Sault Ste. Marie, and whose enormous capitalization did not prevent it from going into bankruptcy for inability to pay a debt of \$5,000,000. In the case of this failure persons of very moderate means lost all their savings, having been led to invest them because the company appeared to have the support of the Pennsylvania Railroad Company, or of some of that corporation's prominent officers.

Wages have been reduced, as one result of the decline of share values, and the effect of this decline upon the demand from consumers; but the reduction has not become general. Railroad companies have sought to cut down expenses by reducing the number of employees in their shops. A large reduction is impending in all those plants of the Steel Corporation where annual scales have not been fixed by agreement with labor unions. More than 100,000 hands in the Northern cotton factories have recently lost 10 per cent., owing chiefly to the increased price of cotton, for which it is extremely difficult to obtain compensation by adding to the price of finished goods. In the early part of the year it was expected that the general advance of railroad wages—following the voluntary increase of 10 per cent. on the Pennsylvania road in November, 1902—would so add to the cost of operation that the net earnings would be no larger than last year's. There has been, however, not only a great increase of gross earnings, but also a very comfortable increase of net, altho the rate of increase has been declining since July.

At the close of the year there seems to be some renewal of confidence, shown partly by an advance of share values in December—amounting, as indicated in

the tables above, to an average of from 5 to 7 points in active stocks—and by the successful and prompt negotiation of several large loans for railway companies.

Out of the capitalization of the great corporations commonly known as Trusts about 45 per cent. of water has been squeezed during the last two years and a half. That is to say, the shares of one hundred such corporations, which at their highest market figures were valued at a little more than \$4,000,000,000, are worth but about \$2,200,000,000 at the recent low quotations. New incorporations have been only \$1,572,201,000 (par value) in the eleven months ending with November, against \$2,520,828,000 in the corresponding months of 1902; and the monthly total in November of the present year had fallen to only \$56,000,000.

The public has acquired, at a high price, much useful information about these incorporated combinations, while shares have been declining. Thanks to the studies of economists, the work of keen critics, the confessions of embarrassed promoters, and especially to the astounding history of the Shipyard Trust, it cannot now be led to believe that the average Trust-maker is moved by either philanthropy or patriotism. It has looked behind the scenes. It has come to understand the generous appraisal of constituent companies, the methods of syndicates that are contented with profits of \$50,000,000, the process of unloading and distributing the new shares that are half water, the real value of promoters' talk about the economies of combination. There should be such economies, but the public now justly thinks that they are the last thing to which the average Trust-maker turns his attention. Not until the storm is at hand do the people hear of the officers of some of our greatest Trusts making those economical consolidations and those reductions of superfluous forces which should have been made at the beginning. The enormous overcapitalization itself tends to prevent some of those economies that are practiced in small companies reasonably capitalized.

At the beginning of the year the whole structure of industrial corporation finance was in a very vulnerable condition. Market values were inflated and

the public had its fill of shares, altho many remained to be "distributed." Liquidation, to some extent, could not long have been avoided. Some believe that it was precipitated, prolonged and forced to an unnatural extreme by the continuous and irresistible pressure of a small group of very powerful capitalists, to serve their personal ends. The course of the market following Mr. Cassatt's destruction of Western Union property, in May, and the character of the continuous selling movement, warranted by nothing in the general industrial and commercial situation, confirmed the belief of a considerable number that the Standard Oil group, jointly interested with Mr. Gould in that railway invasion of the East by way of Pittsburg which had excited Mr. Cassatt's ire, were exerting their enormous power not only to bring this adversary to terms, but incidentally to accomplish other purposes in the industrial as well as the railway field. The theory can at present be neither supported nor overthrown by proof. Mr. Rockefeller is not accus-

tomed to publish affidavits as to his financial transactions. Men familiar with the methods of Stock Exchange trading and speculation know how liquidation could have been hastened and prolonged by the depressing force of almost unlimited capital, skillfully and relentlessly applied; how the disclosure of responsibility for even such a movement could be prevented; how a mere suspicion of an active interest of so great a force in causing depression would bring so many reinforcements that only occasional touches from the master hand would be needed. The idea appeals to the imagination because of the magnitude of the forces said to be in conflict, and the possibility of carrying on such a campaign, by means of certain available agencies, in comparative secrecy. No account of the year's financial drift is complete that overlooks the acceptance of this theory by some who realize how inaccessible the proofs in such cases are, and admit that events of the near future may compel a definite rejection of it.

NEW YORK CITY.

The Blessed Day

BY, HARRIETT McEWEN, KIMBALL

ONCE more the blessed day is here,
Toward which long ages tended:
In whose most wondrous mystery
All prophecies were ended;
And at whose ever glad return
All Christian hearts with ardor burn.

Once more our salutations flow
While Christmas bells are pealing;
Once more before the altar-throne
Of Christ His own are kneeling,
And there, however far apart,
They reach each other, heart to heart.

And there to each He cometh down
As once from Heaven descending,
To seek in each a dwelling-place
And bring the joy unending;
To each He comes, to you and me,
And comes again in mystery.

O, happy heart that opens wide
This Lord and King receiving,
O, happy heart that holds Him fast,
Not faithless, but believing!
O, blessed bond they only know
Who with this common joy o'erflow!

PORTSMOUTH, N. H.

An Old Time Christmas

BY REBECCA HARDING DAVIS

THE world that we lived in when I was a child would seem silent and empty to this generation. There were no railways in it, no automobiles or trolleys, no telegraphs, not one anxious whisper about Trusts or Labor Unions.

The Virginia village, which was our home, consisted of two sleepy streets, lined with Lombardy poplars, creeping between a slow moving river and silent, brooding hills. Important news from the world outside was brought to us, when necessary, by a man on a galloping horse. But such haste seldom was thought necessary. Nobody was in a hurry to hear the news. Nobody was in a hurry to do anything, least of all to work or make money. It mattered little then whether you had money or not. If you were born into a good family and were "converted," you were considered safe for this world and the next. Incomes were all small alike. There were no operas, no trips to Europe, no summer jaunts to drain on them. Worth and Doucet were as yet unborn.

Polly Vance, in her little house down the lane, made for our mothers their occasional silk gowns with great applause, as she had done for their mothers forty years ago.

Just beyond Polly's, where the shady lane crept in between the hills, Miss Felicia Devinnny lived, who dyed our old dresses and wove all the rag carpets. Miss Felicia knew every strip of cloth in those rag balls.

"I see your mother has cut up her red cape," she would say. "Why, I could have dyed it brown and she would have had another year out of it. But it will give a very rich effect to the carpet; I don't deny that. Dear Fred spoke of that cape the other day. 'Such a pure bit of crimson,' he said; 'it gladdened his eyes.' Poor fellow, he is such a true artist!"

But if we dressed plainly, we were fed like kings. From the fat fields on the

other side of the river came all kinds of meat and fruits; from the mountains the hunters brought pheasants, venison and bear meat. Then, too, Miss Felicia had hives of bees in her garden, set in the midst of great beds of mignonette. The poor lady worked with the bees, and gathered the honey, but it was her brother Fred who sold it and put the money in his pocket. Sometimes she would find a spoonful of the white, delicious stuff which he had left, and she would put it on a dainty china saucer, and carry it to one of the neighbors.

"Just a taste, my dear, for your tea," she would say, her thin face quite red with pleasure. "Do observe whether you can detect the flavor of the mignonette. That is my own device. Oh, dear, I wish we did not have to sell the honey! I am so fond of the bees. 'Messieurs, mes amis,' I call them. They are so friendly to me. I feel as if the honey was their gift to me, they work so hard to make it. If we only could give it all away—only think how delightful! But poor Fred must have his tobacco and—and—other necessities." She would make her queer little French courtesy and go away, and then run back to beg us not to think she "begrudged the honey to dear Fred. He was so lonely—so depressed since poor Stacey died. They know,"—glancing upward, her poor old eyes full of tears,—“whether I begrudge the boy anything.”

The Devinnys had been once the De Vignauds, and there was blood in their veins which made them cry and laugh when we Scotch-Irish folk would be grimly silent. There was a whisper that on one or two bits of Miss Felicia's rare china there was a crest and a motto. But she never spoke of her birth, and, of course, no one asked a question.

She had wandered up to our village years ago from the South, and at once began to weave and dye. But she made so many funny mistakes at first that the townsfolk were sure she was only learn-

ing her trades, and so were very patient with her. We children loved to sit in the afternoons in her clean kitchen beside the loom, where the little demoiselle in her coarse blue gown sat perched on her high stool, chatting gayly and throwing her shuttle to and fro. No one in town was so poor as she, but there was a distinction about her to which everybody, white and black, gave homage. Was it in her delicate little hands or the carriage of her head, or her low voice? Nobody could tell.

Colonel Shore—and who knew the world better?—declared loudly, “Miss Devinny may be fifty, but she is a *jeune fille*, and will be if she lives to be a hundred.”

After a while appeared her brother and his wife, Anastasie, and little Hilary. Stacy, as she was called, taught dancing. All the children crowded to her to learn to valse and schottische. She was a thin, merry little woman. While she lived Fred was able to practice comfortably on his violin all day. In the evening she cooked a game dinner for him, which he always washed down with Burgundy.

“Why don’t you play for your wife’s pupils, Devinny?” the Colonel asked him one day. “You’d save her the hire of that darky fiddler.”

Anastasie’s blue eyes flashed. “Is it that you would have me degrade my husband?” she cried.

Fred said nothing, but he drew his bow across the strings with a longing wail, and turned his melancholy gaze to the window skyward.

Stacy worked harder and grew thinner every day; laughing, and losing her breath oftener as she laughed, until one morning it left her altogether, and Fred, much dismayed, was forced to lay her away to rest, still smiling.

Felicia worked far into the nights that summer, to give dear Fred time, she said, to find employment suited to his great talents. He wrote poems incessantly for the Richmond *Literary Messenger*, the only magazine then in the South. They always came back. Then he sent them to the weekly county paper, with the same ill luck. At last one was published, and he bought some strips of pink satin and had the poem printed on them, and presented them to the ladies in

town. The satin smelled strongly of violets. Everything about Fred smelled of violets.

He was tall, thin man, with a black mustache and shifty, pale blue eyes; the very type of Ivanhoe, we children thought. Could anything be more knightly than his fur-lined cloak, and the haughty way in which he threw the left corner of it over his right shoulder? We would rush to the windows to see him pass. He was gay and affable in his bearing to everybody in town, with the true manner, we thought, of a prince of the blood, except to old Doctor Morris, to whose church Miss Felicia belonged. The kind old man always looked sternly at Fred when they met on the street, and he would speak a few words to him in French. After that Fred would stride haughtily around the corner whenever he saw the old man coming.

He began to complain, too, of the noise of the shuttles and the smell of the vats; so poor Felicia carried her loom and dye-pots to an old stable at the end of the lot. Dr. Morris one day came to make a pastoral call and found Fred in the parlor, lolling before the open fire, violin in hand, flowers in the windows and the perfume of violets abroad in the air. The old man nodded to him and pushed on down to the stable, where Miss Felicia, blue with cold, was at work at her loom, and Hilary, wrapped in an old cloak, was learning his letters. The cracked old stove, on which a pot of purple dye was boiling, poured forth smoke, but no heat.

The Doctor shivered as he sat down, and smiling, opened his prayer book, and proceeded according to routine to hear the boy say his catechism.

“What is your name, my child?” he said.

Hilary drew a frightened breath, then “Edouard St. Hilaire, Comte de Vigneaud, et pair de France,” he recited shrilly.

“Ah!” cried Felicia in dismay, but the Doctor did not look up. He finished the catechism; and then prayed with them and bade them good-bye.

“Peace be upon this—house,” he said as he left the stable. He went back to the parlor, where, judging from the furious clamor which promptly arose, he did not bring peace.

"It is my son's name and title!" Fred shrieked. "Why shall he not claim them? Why shall I not banish Felicia to the stable? She demeans her race! She makes of herself a servant in the eyes of all—a scullion!"

Nobody heard the Doctor's answer. But, that night, he wrote a long letter to the head of the great firm of Choteaud, in St. Louis, reminding him that they "had been schoolboys together and that he never before had asked a favor of him," etc., etc.

Weeks passed before the answer came. Fred shut himself up in the little parlor with his flowers and violin. He wrote now and then, but slept much. Colonel Shore said openly that he had given up Burgundy and taken to old Bourbon.

There was, too, a strange change in Miss Felicia. Since little Hilary came his old aunt had been his playfellow and slave. Even when his mother lived it was Miss Felicia who bathed him, and curled his yellow hair, and made for him those extraordinary scarlet trousers which amazed the town. She used to weave until midnight all week to save Saturday afternoons for "Hilary's fêtes."

We children never had known such fêtes. How we stamped up that rocky path to the sunny glade on top of the mountain, each child with its basket, Miss Felicia panting in front, a huge panier on one arm and the fat little fellow on the other. Such games as she knew, such songs! When she solemnly unpacked the cold meat and the bottles of vinegar, molasses and water, you felt it was a true royal banquet. Before the day was over she was younger than any of us. I can see her now, her eyes shining, her hair down, dancing with the boy, when we played "Sur le pont d'Avignon."

"Les beaux Messieurs font—comme ça! Et puis encore—comme ça," while we posed and pirouetted until we tumbled on the grass breathless.

But Saturday after Saturday passed now, and we were bidden to no fêtes.

After his mother died the boy never was out of Miss Felicia's sight. But now, when we went to sit beside the loom to watch the shuttles flying, she always was alone. Her cheeks, we thought,

looked gray and worn with tears, tho she always tried to laugh and sing when we came in.

When she trundled the rolls of carpet home on her wheelbarrow the scarlet-legged baby had always trotted beside her. What with his hand-springs and her calling on everybody to look, it had always been a kind of triumphal procession.

Now she pushed the heavy barrow up the hilly street alone, and looked like a beast of burden.

One woman in the town, who had a habit of mothering every hurt living creature, drew Felicia into our door one day.

"Where is your baby, my dear?" she said.

The woman cried out as if she had been struck. "Fred will not let him sleep with me, nor eat with me, nor come where I am! He says I have disgraced my family. I have not heard my boy speak for three days."

Things were in this state when Dr. Morris one day went with a letter in his hand to Fred.

"I have here the offer of a position for you with the Chouteaus as foreign corresponding clerk at a salary of a thousand dollars," he said. "You are a good French scholar. The duties will be easy. You are to report at once."

"I thank you for your energy in ridding the town of me," said Fred smiling.

"Both you and the town will be benefited," the Doctor said curtly, and left him.

For three days Fred was busy in preparation. On the evening of the third the big steamboat "Messenger" stopped at the wharf. Her whistles shrieked and her long lines of lights shone against the darkness.

Now the garden of our house opened on to the river, and Felicia's friend (The Mother, as people called her) was tying up her jasmine when Fred Devlinny passed, carrying a carpet sack. His sister came running after him, breathless.

He stopped.

"You will not go without kissing me good-bye!" she cried. "And I—I cannot find Hilary! Oh, Fred, what have you done with Hilary?"

"He goes with me," said Fred. "He

is on the boat now. Did you think I would leave my son here to be made a laborer by you?"

He was very calm, but the poor lady was quite crazed. She cried out and held his arms by force. "You can't do it! You can't do it! The firm won't have a man with a child—"

"Firm? You don't suppose I am going to slave behind a desk in St. Louis? I go to New Orleans. I shall make a fortune there. In a week—in a night! Then I shall claim my place in France and my title—"

"Oh, I know! You're going to the cards again! You have tried them before!" She stood in front of him. "Frederick," she said in a hoarse whisper, "leave me the boy. Look at me! I have nothing. I am an old woman. I did not marry; I have had no lover—no child. I never have had anything good in my life but him. I'll work harder. I'll make him rich. I'll make him a gentleman—"

Fred shook her off. One or two men who had been smoking on the veranda now came hastily out of the darkness.

"You can't interfere," said one as they passed. "He ought to be kicked into the river, but—the child is his—"

"I'll manage the brute," muttered Colonel Shore. "Fred, my dear fellow, hear reason. What can you do with a baby like that? Leave him with Miss Felicia until you have made your fortune, and then come back for them."

Fred showed his teeth like an angry dog. He bowed low to them. "I thank you for your zeal in my affairs, gentlemen. You know nothing of me nor of my class. It is—pardon me—" waving his white hand, "different from yours. My sister has renounced it. She may remain with you. She is—canaille!" and shaking his fingers contemptuously, he strode down to the boat, which was now loosed from its moorings. Felicia stood panting for breath as the great dark hulk swung out into the river, its lines of lamps quivering like cords of light thrown across the black night. The wild, melancholy chant of the negro deck hands came back like a funeral wail.

Felicia stared at us. "Is Hilary gone? Hilary—" she said.

"No! Look—there he is!" cried

Colonel Shore. "Fred has brought him on deck. Can't you see him? He is making the boy kiss his hand to you. That is to say he is coming back."

"Yes! Yes! That is what he means!" cried the poor lady, kissing both her hands to them, with sobs and laughter. "You're coming back! You're coming back, Bébé!"

When the boat had gone into the night they led her into the house.

"Well, perhaps," muttered the Colonel, "Fred did mean that—eh? What d'ye think? Even the devil isn't all black."

Two weeks after that the "Messenger" was burned at night to the water's edge, on the lower Mississippi. Hundreds of lives were lost. Many of my old readers will remember that horror of their childhood.

Major Kean, of our town, was one of the passengers, but he was saved. He was ill when he was brought home, but gave Dr. Morris an account of the accident.

"Devinny? Oh, yes. He was on board with his child. Both were lost. Fred was in the lower cabin playing poker and the boy was asleep on a bench. He was afraid to go up to bed alone. After the explosion the water was full of the dead and dying. You could see them by the flames. I got hold of a keg and so was saved. Devinny was sinking when I saw him. He couldn't swim. He was trying to hold the boy up. I saw the little red legs going down. Yes, they were both lost. Tell that poor woman, but—don't say anything about the poker, eh, Morris?"

Then Miss Felicia became the charge of the village. From our pompous little Mayor, who promptly sent her a barrel of hams, to old Jo Biggs, the carter, who spent every evening in tending her bees, every hand was held out to help her. She never wept and seldom spoke, but grew thinner and whiter every day. Nothing would induce her to leave her house over-night.

"I have no doubt," said Mrs. Colonel Shore, "that she thinks Fred's spirit or the child's will return to it. She is on watch for them."

"Oh, if it is only Fred's ghost that turns up!" cried the Colonel. "But—the poor old girl don't know it, but there

was a big load lifted out of her life when that boat took fire."

"Samuel," said Mrs. Shore, sternly, "*De mortuis*—you know." For even women brought scraps of Latin into their talk at that time.

The winter crept on, and Christmas came near. The whole village was feverish with excitement. You never heard in those days of Santa Claus or St. Nicholas or of Christmas trees. These are modern, foreign fashions. We had only the fact of the Birth in the Stable, of the Holy Child in his mother's arms, watching us on his day to see if we loved each other, and tried to make everybody happy, from old grandfather by the fire to the black wretches in the stone gaol yonder, stretching their hands out of the cell window and calling to us as we passed by. We believed that the same fairies who made the queer rings in the grass in summer were sent by him on Christmas eve to fill our stockings and pile up toys and books on the testors of the beds. We had but the one great holiday then, but the fun and love of it warmed and lighted the whole year.

Dr. Morris and Father Vincent usually were the chief promoters of all plans for the great day, but this year they had gone to the Mississippi to look after the survivors of the wreck and to bury the dead.

One day, a week before Christmas, the Mother, who was busy in the kitchen with huge piles of mince meat and plum cakes, stopped short. "I have an idea!" she said. "I know what will comfort her." She did not name her, for the dumb, pale woman was always first then in everybody's mind. She washed the flour from her pretty arms, took off her great white apron, and soon was in Felicia's kitchen, making up the fire and brewing a cup of tea.

"I went into that cabin by the wharf just now," she chatted on. "You know? Where old black Pink lived and her six grandchildren. She died the other day, and the baby, too. They were buried in one grave."

"Buried?" said Felicia, staring into the fire. "That poor black baby could be laid under the grass—with prayers and love. The fishes will not eat his little body—"

Her friend gasped a little, but went on. "The other children have no one to care for them. I found them without a fire this morning and nothing to eat. The poor little black things have no Christmas to look forward to."

Miss Felicia turned quickly, her dull eyes lighting. "Hungry?"

"Yes." She set down the tea pot. "I thought, Felicia—if *you* would try to make them happy? To bring them close to the Child on his day? Wouldn't it make Hilary glad? Think a minute. He was such a kind, friendly little soul. Wherever he is—doesn't he want you to do this thing?"

So that was the way that Miss Felicia began to work for Pink's children that week. She would break down sometimes, and pant for breath and cry, for her strength was nearly gone.

"They have no clothes," the Mother would say. "Here is some old flannel. Give it a dip in the logwood pot and we can make the girls fine purple gowns of it."

Or: "Their feet are all frost-bitten. If you finish that bit of carpet you could buy them shoes," and so on, until the poor lady scarcely stopped to eat or sleep, she worked so hard to give them all they needed. "It is Hilary's plan!" she would tell us, her eyes kindling. "Hilary wants them to have a Christmas like you other children. But I must get to work. I am afraid I shall not be ready."

However, she had many helpers, and by Christmas Eve the little parlor was filled with purple frocks and stout stockings and dolls and toy guns and little breeches, green and gray. "Not red," she cried, "I couldn't make them red."

"No, indeed," said the Mother. "I will bring the children up early in the morning."

In the night the "Kentucky Belle" came up from below, and Father Vincent and Doctor Morris arrived. They had found Fred's body and buried it.

Pink's children had suspicions of what was awaiting them, and very early on Christmas Day came to Miss Felicia's door in a body. She let them in, trembling and crying while she laughed. "These are for you—yes. It is Hilary, my own child, who gives them to you. Put on the stockings first, now the shoes.

No, the breeches are for the boys. Here are your guns, and the dolls. But you understand? It is Hilary who sends them. He—"

"Yes—yes," said the Mother, anxiously. "Now, be off home. There's a good breakfast for you there. Felicia, here are some of your friends. They—we came to wish you a happy Christmas—" she sobbed a little, and kissed her, and then stood back as all the neighbors

quickly came in, each bearing some gift which they hoped would make her life a little brighter.

And as Felicia was stammering out her thanks there was a sudden silence, the crowd drew back, and in the doorway stood Doctor Morris and Father Vincent, and between them—Hilary!

Hilary, his curls flying, his breeches red and torn, shouting and crying as he ran and jumped into her arms.

PHILADELPHIA, PA.

The Gospel Stories of the Virgin Birth

BY BENJAMIN W. BACON, D.D.

PROFESSOR OF NEW TESTAMENT CRITICISM AND INTERPRETATION IN YALE UNIVERSITY

IT is a misfortune of the Church that the historical interpretation of Scripture seldom comes to its own, until the magical has first been given full control, and, through more or less of disaster, has been found wanting.

In such a case as the adapted fable of Jonah, or the purified creation myth of Genesis, historical interpretation, having no theory of inerrancy to defend, was prepared to treat legend as legend, myth as myth, without denying that to the inspired writer who makes them the vehicle of his religious teaching they were substantial facts. Hence, it was not diverted from the ethical, didactic aim, which with the sacred author is the vital thing. The rival method is a direct descendant of that which searched the Scriptures as in themselves the medium of eternal life, instead of merely testifying to him who does convey it (John 5:39). This method is so preoccupied with defending a theory of inspiration which precludes the appearance in canonical historians of those elements of legend and misconception, so abundantly found in all others, that the essence of the matter, the author's didactic aim, lies often wholly obscured until the apologetic structure has collapsed.

It is too soon to say that collapse is imminent in the defense of the Gospel stories of the Virgin Birth. There has been, indeed, a century of persistent objection to their historicity on grounds of Church history and internal evidence. Critics have appealed to the steadfast refusal of the conservative element of the Palestinian Church to admit the doctrine; to its relatively late appearance in gospel tradition; to the mutual irreconcilability and generally legendary character of these chapters of Matthew and Luke; to the absence of any such conception of Jesus's origin, or any knowledge of it, in the Pauline Epistles, Mark or any other New Testament writing; to the different idea presented by Paul (Rom. 1:3, 4), and even by many passages of the Gospels (*e. g.*, Mark 3:20, 21; 6:1-3, and parallels, John 1:45), Acts (3:22-26), and the very genealogies of Matthew and Luke themselves—all without convincing effect. Within the last few years has come the discovery of a manuscript of the Gospels presenting a form of the text older than any hitherto known, wherein the statement is that "Joseph, the husband of Mary, begat Jesus;" and this strange and self-contradictory reading of the Sinaitic Syriac

has been subsequently reinforced by additional textual evidence. No wonder, then, that in Germany and England conflict over the clauses of the Creed, "conceived by the Holy Ghost, born of the Virgin Mary," has been renewed with redoubled ardor; for textual criticism, once as anathema as the higher criticism now is, has been recognized to-day as the friend and ally of orthodoxy. But even textual evidence scarcely suggests to the mass of conservative minds a question of this long-established belief. It would be premature, indeed, to talk of its collapse.

Nor does the season when Christendom celebrates the "unspeakable gift" of God seem opportune for any iconoclastic remarshaling of evidences, old or new, against that "sweet story of old," whose literal historicity seems to some an indispensable basis of their belief in the doctrine of incarnation. This, too, is not our purpose.

But it is surely neither premature nor inopportune that we apply to these artless narratives that true historical interpretation which is independent of the question whether their authors are narrating historical fact, or only employing what they deem such, in the interest of a higher purpose.

Regarding this didactic aim, two things may be set down as certain, which at once raise the whole controversy to a higher plane. (1) It is certain that our first and third evangelists did not intend to furnish by this means a basis for the doctrine of incarnation; nor had they any idea of attributing to Jesus in this way a superhuman nature. (2) It is equally certain, for largely identical reasons, that the Græco-Roman, mythological idea of a demi-god, born of a human mother by a divine father, was wholly alien to their thought, and probably without influence upon the development of the story. Hence, those are equally in error who on the one side cling to the miraculous birth, as if the divinity of Christ were a matter of the "body which God prepared him," and there could be otherwise no "ministry of reconciliation, to wit, that God was in Christ reconciling the world;" and those, on the other, who cannot tolerate these birth-stories, because they under-

stand them to imply ideas of God akin to heathenish mythology.

The basal fact for every student of these chapters of Matthew and Luke, in the light of both their linguistic features and the atmosphere in which they move, is that they are Hebrew to the core. This is simply fatal to all comparison with heathen mythology (*pace* the Church Fathers of the second century); because to any scholar who knows the Judaism of the time, the idea of a Jewish Christian inventing myths in honor of Jesus after the model of the amours of Zeus is simply inconceivable, to say nothing of their obtaining currency in the Church. In the "Gospel according to the Hebrews," the Holy Spirit is Jesus's "mother," because the Hebrew word is feminine. And Luke 1:35 might be rendered into Hebrew without the slightest incongruity of thought, because it is creation, not procreation—that is thought of—as when in the beginning the Spirit of God "brooded" on the face of the waters.

Able critics have attempted to discriminate an earlier form of Luke 1-3, into which 1:34, 35 and *ὡς ἐνομιζέτο* "as was supposed," in 3:23 were inserted by the editor. This may or may not be warranted. Our concern is with the final author, and the very fact that he retains the references to Joseph as the "father" of Jesus, and to Joseph and Mary as his "parents," and that he introduces the pedigree of Joseph as entitling Jesus to "the throne of his father David" (1:32), shows that to him the miracle of Jesus's birth made no difference with his relation to Joseph. To the narrator the miracle is simply a more impressive instance of what God wrought in the case of Elizabeth, Rebekah and Sarah, without affecting the paternity of John the Baptist, Jacob or Isaac. In short, the narrators have not the remotest idea of the hereditary taint of sin, as a motive for relating the peculiarities, real or fancied, of Jesus's birth. Neither have they any serious idea of connecting with it any doctrine of incarnation, for the simple reason that this doctrine is foreign to their whole sphere of thought. By the Semite in general, the Jew in particular and the authors of Matthew and Luke-Acts most specifically of all, the

notion of divinity is applied, if at all, only in the sense not of incarnation, but of apotheosis. God "raises up" a deliverer "from among his brethren," whom he *exalts* to sit at his right hand, and grants to be called his "Son," in accord with the Messianic visions of prophet and psalmist. The conception of the incarnation of a pre-existent Being belongs to a radically different stratum of New Testament literature. This non-Semitic idea had indeed become naturalized in the later speculative thought of Judaism through the Wisdom literature, and to some extent in Apocalypse; and it has a development of supreme interest and importance in the Pauline Epistles, Hebrews and the Johannine literature. But it is characteristic of Synoptic tradition that it remains absolutely unaffected by it, not even Acts affording a single trace of the doctrine of pre-existence.

To Matthew and Luke, accordingly, the wonder of Jesus's birth was simply a "sign," like other miracles whereby Jesus of Nazareth was "approved of God unto" Israel. But why? A sign of what? There must have been a motive for the introduction of this new feature in the Gospel story, carrying back its "beginning" from where it had been fixed by common consent from the days of the apostolic preaching (Acts 1:22; 10:37) to that of its embodiment in the Gospel of Mark, beyond a mere desire to extend the list of wonders, as in the idle dreamings of the later Gospels of the Infancy.

We may learn the real motive of this backward extension from the history of Christian thought in the closing decades of the first century, revealing to us, as it does, the misconstruction to which the earlier type of Gospel narrative was exposed at the hands of heretical teachers. From Cerinthus to Marcion it was the disposition of the Gnostic, whether of Jewish or anti-Jewish type, to minimize the importance of the historic Jesus by laying all stress upon the divine effluence or emanation, of which, as Cerinthus expressed it, Jesus the carpenter of Nazareth became the "receptacle." Docetism revered only an æon Christ, which descended on Jesus at the time of his baptism, with-

drawing again before the passion. Against this tendency I John 4:2, 3 makes it the test of a spirit (of prophecy or teaching) that "every spirit which confesseth that Jesus Christ is come *in the flesh* is of God; and every spirit which confesseth not Jesus is not of God, but of anti-Christ." A dualistic spiritism was the supreme danger of the time. In the Fourth Gospel it is met by an incarnation doctrine—a Logos becoming "flesh;" in Matthew and Luke by the transformation of the *baptismal* into a *prenatal* adoption.

How early the conflict began we can hardly estimate. According to Godet the blasphemous cry heard even in the Pauline Church in Corinth, "Jesus be anathema," was uttered in this sense; as, in fact, Cerinthus himself is traditionally represented to have been Paul's opponent there. At all events, in A. D. 80-100 it would be felt as a weakness of that form of the Gospel story which with Mark had fixed as "the beginning of the Gospel," an anointing of Jesus with the Spirit at the baptism of John. Unmodified it played into the hands of the "Adoptionists." Hence, the abandonment of the primitive reading (so *Gospel account to the Hebrews*, Luke 3:22, B text, and Heb. 5:5). "To-day have I begotten thee" in favor of the present Markan form in Luke 3:22. It was the strong, historic sense of the Palestinian mother-church which now reacted against this extravagant ultra-Paulinism; and by extending the "sonship" over the whole lifetime of Jesus from his very birth (Comp. Gal. 1:15; Jer. 1:5; Is. 49:1), resisted the slight a false dualism would put upon "the flesh." The early creed which insists, even against Paul himself, on a "resurrection of the flesh" (τῆς σαρκός) insists also on Jesus having been "conceived of the Holy Ghost, and born of the Virgin Mary." In fact, it proceeds directly from this to the reality of the passion. It belongs in the same family as that gospel, which, after having insisted that from the very womb "that which was born of" Mary "must be called holy, the Son of God," lays similar stress upon the fleshliness of the resurrection (Luke 24:36-43). And as between these teachers of the Church and the fantastic dreams of

the Docetic heretics, who would forever have cut loose from the historic Jesus, there can be little question where the sympathy of the modern world belongs.

History or legend, such is the didactic aim of the birth-story. Many will doubtless account for the late appearing belief with Professor Sanday, by the supposition of special information long withheld, but at last conveyed to the Evangelist Luke directly or indirectly from the Virgin Mother. In the judgment of the present writer the alternative is not to be found in the influence of heathen mythology, but in the literary development of the New Testament itself. The Pauline doctrine of a "spiritual seed of Abraham," "which is Christ," and which, as Isaac was, is born not of the flesh, like Ishmael, but of a "word of promise" (Gal. 3: 16, 28, 29; 4: 21-31; Rom. 4: 16-21; 9: 7-9), is taken up in I Peter 1: 23-25, and applied in the true Pauline sense to the "Israel of God," the Diaspora ("sowing") of the Gentiles, who are "begotten again of the Word of God." In John 1: 12, 13;

3: 3-8 this doctrine of the new birth of the Spirit is still further developed, tho still in the strict Pauline sense. The body of believers, as a *collective Christ*, are "born of the Spirit," supernaturally, as Isaac was, "by a word of promise." For even in Rabbinic tradition Isaac is called the "God-begotten" in allusion to his supernatural birth. But a parallel development of this Hebraistic idea is quite conceivable. How easily Isaac could become "a type of Christ" is seen in Heb. 11: 17-19; and how readily the doctrine of a supernatural, spiritual birth for the collective Christ could be individualized is illustrated in the reading of some of the earliest manuscripts, which in John 1: 13 have, in spite of the context, "*who was* born, not of blood, nor of the will of the flesh, nor of the will of man, but of God." Perhaps, then, it is, after all, in the thought of Paul that these two so widely divergent streams of Synoptic and Johannine tradition find their common source, the thought which makes our God-begotten "the First-born of many brethren."

NEW HAVEN, CONN.

A Creed for Christmas Tide

BY CHARLES PROSPERO FAGNANI, D.D.

PROFESSOR OF OLD TESTAMENT LITERATURE IN UNION THEOLOGICAL SEMINARY

I believe in GOD as the source of all love, so that wherever there is love, there God is.

I believe in JESUS CHRIST as the supreme revelation of Divine and human love, the perfect and eternal Ideal and Lord for all who, through Him, learn to love.

I believe in MAN as capable of complete salvation from sin (which is want of love), thereby becoming perfect in love as God is per-

fect; and as intended to enjoy and manifest the love of God forever.

I believe in the CHURCH as the association of all who love, for the purpose of extending the Kingdom of God.

I believe in the KINGDOM OF GOD as the ever progressive realization of love throughout mankind, until God's will is done on earth as it is done in heaven.

AMEN.

Interviewing Wall Street Leaders

BY W. R. GIVENS

[Mr. Givens up to a few months ago was the Assistant Financial Editor of the *New York Times*, when he resigned his position to take up the practice of law in his native city in Canada. It will be seen from the following article that Mr. Givens has many interesting experiences to relate of his work in Wall Street, the chief among which is undoubtedly the account here published, we believe for the first time, of how the famous "undigested securities" interview with Mr. Morgan was obtained, and who was its real author.—EDITOR.]

IT is proverbial that the busy men of the world are those who seem to have greatest leisure or, rather, who appear to be able to find time for the doing of a multitude of things which

to the ordinary man would be quite without the bounds of possibility. This is essentially true of Wall Street's "big men," who, be they never so busy, rarely fail to find time to see any one who, calling upon them, appears to be on genuine business bent. That this is so is known of all the Wall Street newspaper men, and especially the writers of market leaders and gossip, whose duty it is, out of the great mass of rumors and reports daily heard in the Street, to winnow the wheat from the chaff—to extract the dross and leave only the pure gold. To this end the financial writer must endeavor to

keep in touch with the leaders in the Street, and by the results of that endeavor will he be judged. If in any way, by perseverance, by "pull," by good luck, by a reputation of not violating faith, he first gets the ear and then the

confidence of any or all of those leaders—to that extent he is essentially a valuable man, and his newspaper may be depended upon to give the financial world, at least, an occasional "scoop"

that not improbably will affect the markets of the world. Contrariwise, if he do not succeed, if he be unfortunate in his presence or in his address, if he know not how to keep his head or his counsel, if he write some and talk more of things intended neither to be written nor to be spoken about—depend upon it that newspaper man will suddenly disappear from the financial bailiwick and Wall Street will know him no more. Incidentally it may be said that for one newspaper man who, in the vernacular, "catches on" in Wall Street a dozen fail. Hence the axiom that good

Wall Street men (by this being meant men able not only to "see" news and to get it, but to write it as Wall Street news and gossip ought to be written) are "scarcer than hen's teeth."

All of which is but preliminary to a

JOHN D. ROCKEFELLER

brief statement of how Wall Street's leaders are to be reached by the average outsider, whether he be newspaper man or what not. In a general way it may be said that the task of the financial writer is easier than ordinarily may be supposed, for the reason that, after all, even "great financiers" are but human and are disposed, therefore, if merely for policy sake, rather to be friendly than otherwise to the writer who represents so powerful a factor in shaping and influencing public opinion as a New York newspaper — who speaks, in black and white, and in a manner oft-times accepted as law, to a great mass of readers, who look upon the utterances of the paper as manna put out to them, as it were, from heaven for their speculative sustenance and deliverance. The average layman, in short, would scarcely credit the immense influence, in a speculative way, that a single paragraph on the financial page of a reputable newspaper may have. And especially is this so if, because of the writer's known or alleged intimacy with this or that financier, the presumption arises that the article in question was inspired and came from the inner circle.

In the five years that I was in Wall Street in active newspaper work I had the good fortune to meet, time and again, all the leaders there, some now gone, some now living—J. P. Morgan, James Stillman, H. H. Rogers, James R. Keene, Jacob H. Schiff, Russell Sage, D. O.

Mills, Lyman J. Gage, George W. Perkins, Washington E. Connor, G. P. Morisini, John W. Gates, Charles M. Schwab, H. C. Frick, William Rockefeller, Judge Moore, Collis P. Huntington, Samuel Sloan, W. H. Truesdale, Frederick D. Tappen, E. H. Harriman, George Gould, George F. Baker, H. C. Fahnestock, F.

J. PIERPONT MORGAN

A. Vanderlip, Charles S. Mellen, Roswell Miller, James J. Hill, James Speyer, E. H. Gary, H. O. Havemeyer, H. H. Porter and a host of others. Some were easy to "get at;" some difficult at first, easy afterward; some always difficult.

In the "always difficult class" may be set down E. H. Harriman, William Rockefeller and H. H. Rogers. Mr. Har-

GEORGE GOULD

riman was so because the attendant at his office invariably refused to take in the newspaper man's card; William Rockefeller because he was never "in;" H. H. Rogers for the reason that before one could see him one had to run the gauntlet first of an attendant, then of an acolyte higher up in the scale, and, finally, of a woman private secretary—the only female secretary, to my knowledge, in the office of a Wall Street leader, and one who by her sphinx-like demeanor and policy, if nothing else, earns the \$10,000 yearly salary she is

understood to draw. If any editor or reporter, past, present or future, has been, is or will be able to get any information from this secretary he ought to chronicle it as among the modern miracles. Nor, when one sees these men, are they inclined to talk much—certainly not for publication. Indeed, the only time when E. H. Harriman was known to take the newspaper writers generally into his confidence was on his return a little more than a year ago from an extended Western trip. At this time, much to the surprise of the writers, he invited them all to his private office and there gave them each a typewritten "interview" with himself, in which he set out in striking and picturesque language—for Mr. Harriman is a writer of no mean ability—his impressions of the West and his opinion as to the future. Immediately thereafter (the winter was coming on) he hibernated, nor

has he been seen since by any but a conspicuously few newspaper men.

In respect to other leaders whose names have been set out, the story of how they have been or can be approached may perhaps best be told by some personal allusions. First taking J. P. Morgan, it may be said, without any fear of contradiction, that he is, or at least appears to be, more indifferent to the newspaper man, his work and his writings, than any financier in the Street—and this tho Mr. Morgan's interests are believed to be

JAMES STILLMAN

larger, marketwise, than those of any other individual. It follows that, being indifferent to the writers, Mr. Morgan is not easily gotten at, and when gotten at is not very communicative. Such at least is the burden of the cry of the Wall Street newspaper man—a cry which in the end became so plaintive that finally a number of the writers got together and decided that thereafter, whenever there seemed to be occasion for it, one of their number, representing all, should try to see Mr. Morgan and divide up with the others whatever crumbs of wisdom or information should thus be obtained. That arrangement went into effect a year ago, and I believe is still in force.

When I was in the Street, and working as I conceive every newspaper man ought to work, free from the “combine,” I had the good fortune to see Mr. Morgan many times, and to get from him, as exclusive, the only two expressions in respect to the stock market and its probable future given by him in five years. The last of these was the interview in which appeared the now-famous phrase “Undigested Securities.” In this connection it may be well to correct a popular misconception as to the origin of this phrase. When I saw Mr. Morgan on this occasion he at first refused absolutely to discuss the market or its prospects, and it was only after recalling to him that his former

RUSSELL SAGE

D. O. MILLS

Copyright, 1903, by Pirie MacDonald, Photg'r of Men, N. Y.

statement to me had lifted the market out of its slough of despond that he consented to talk. Then ensued a fifteen-minute conversation, with Mr. Morgan interjecting semi-occasionally a reminder that the talk was for my personal guidance as a writer and not for publication. I took no notes, for I had learned by experience that financiers are wary of men who take notes—I mean newspaper notes. When Mr. Morgan had finished talking, and had answered several questions

put by me to him, I said: "Now, Mr. Morgan, why shouldn't I publish this? You feel strongly on the subject. Why not let the public know your sentiments?" Whereupon Mr. Morgan, after a moment's hesitation and some discussion with me as to the advisability of the step, replied, "Well, my boy, if you can make anything out of it go and try it, and let me see what you do." Whereupon I sat down and wrote a seven-page interview, which, before it came again to my

hands, was read by Mr. Morgan *six* times, and was then passed on to Charles Steele, the legal member of the firm, to see, as Mr. Morgan said, "if it was legally expressed." As a financial writer I was flattered when it was handed back to me without a word or syllable changed.

And here I may say—and it cannot be violating a confidence—that the newspapers of the country and all others were in grievous error in crediting Mr. Morgan with the authorship of the phrase "Undigested Securities." That phrase I had first read in a financial article in the *London Times*, and it was the "patness" of the expression more than anything else that prompted me to see Mr. Morgan and ask him as to it and its significance, if any, from the American standpoint. Hence the

SAMUEL SLOAN

Morgan, and by not a few people now regarded as the real leader in the Street. Mr. Stillman is always accessible to newspaper men whom he likes, and is not prone to turn away even those whom he does not like. Those (and they are few) whom by experience he has learned to trust he cordially invites into his private office and there freely talks to them, but invariably with the understanding

that his name is not to be used. If perchance or otherwise the name is used, Mr. Stillman forthwith stands mute to that journalist, who thereafter finds one of the most important sources of information forever cut off to him. Whatever Mr. Stillman says may be absolutely depended upon—this because, to perpetrate an "Irishism," he says nothing when there is nothing to say,

incorporation in the interview of the phrase "Undigested Securities"—a phrase that in the end worked more to the hurt than to the help of the stock market, tho on the appearance of the interview on the following day prices opened up from one to two points and the whole course of the market was turned for some days.

In marked contrast to Mr. Morgan is James Stillman, the head of the National City Bank—fully as busy a man as Mr.

JAMES J. HILL
Copyright, Pach Bros.

E. H. GARY

CHARLES M. SCHWAB

and talks only when and where talk counts. The brilliant head of the National City Bank is noted among other things for the fact that while he never gives a speculative tip he is ready to the point of actual kindness to counsel a young man as to investment; as to when and why he should or should not invest, and in what particular direction. One young man whom I know very well saved a modest fortune by following Mr.

Stillman's advice instead of yielding to his own promptings and inclination—advice given, it may be said, in Mr. Stillman's private office in the course of a half-hour's friendly talk while several millionaires were cooling their heels in the ante-room, waiting for an opportunity for even a brief interview with Mr. Stillman.

Russell Sage, in these late years, is more inclined to talk than in the old days, but is much harder to get at,

now that he is becoming more feeble. A medical attendant is constantly at his side, in the office and on his walks, and the new man in the Street, who never had the pleasure (for it is a pleasure) of Mr. Sage's personal acquaintance finds himself much handicapped and is scarcely ever likely to reach the veteran financier, cooped up as he is in a private office, far removed from the outer one, and attended not alone by his physician but by

his secretary.

When one does see Mr. Sage it is easily worth whatever trouble may have been experienced, for Mr. Gould's one-time associate is a most interesting and vigorous talker, and does not hedge his word about by any restrictions or limitations. If Mr. Sage has anything to say he says it, nor is one forbidden to use it, or even cautioned against using it. The "old man," as in the Street he is called, knows no

H. C. FRICK

fear in respect of his utterances, and cares not whom he hits so that he be convinced he is in the right. For that matter, one may see him as freely at his Fifth Avenue residence as at his office, except indeed on Sunday, which day Mr. Sage religiously sets aside as a day of rest, refusing to be disturbed by any newspaper writer, whatever the pretext. It will not improbably be found, however, that Mrs. Sage is really the ruling force and guiding spirit in this connection.

Coming to others of the late Jay

Wall Street, and hence it is that many newspaper men receive solid inspiration from him and eagerly seek him out. Mr. Morisini—the love of the Italian exile for his adopted land continually shows in his conversation—makes his headquarters with Mr. Connor, and is a most entertaining talker, especially when he recalls the days of his association with Jay Gould. The story that this distinguished-looking foreigner most likes to tell about Mr. Gould is that relating to a young man who came to Mr. Gould for stock market advice. “Young man,” said Mr.

E. H. HARRIMAN

Gould's associates; there are his son, George Gould, Washington E. Connor, and G. P. Morisini. George Gould seldom figures in the newspapers, and tho always friendly to newspaper men, invariably begs to be excused from saying anything. Mr. Connor and Mr. Morisini are equally reticent (that is, in matters for publication), tho both talk freely to financial writers, when first it is understood they are not to be quoted. Mr. Connor, it may be said, is credited with being the best student and observer of speculative and market conditions in

Gould, “if you have a little money to start with and some common sense, there are only three things more you need in Wall Street. The first is patience, the second is patience and the third is patience.”

James R. Keene is always “at home” to some newspaper men, never to others. He is a man whose likes and dislikes are strong, and who, because of his poor health, is to the newspaper man very much of an uncertain factor. His confidential secretary is glad enough to take in your name—differing in this respect

WILLIAM ROCKEFELLER

from Mr. Sage's and Mr. Harriman's; but this does not assure you a welcome, tho on the day previous you may have been closeted with the master-manipulator for half an hour. If, however, you should be favored you will walk into the presence of a man, always magnetic, always interesting, always alert, always pacing up and down the room like a caged tiger, always brimful of fire and fight, of forcible and correct (if not select) English. Taking him all in all, Mr. Keene is easily the most interesting personage in the Street—a good friend, a bad enemy, a never-say-die fighter, a man of masterful manipulative and speculative forces and resources. It is not generally known, but it is a fact nevertheless, that Mr. Keene finds interest not alone in stock speculation and in his stable, but in the reading of poetry, of which he is fond to an absorbing degree. Shakespeare, Tennyson, Milton, Byron, Browning, Burns—these are among his favorites, and these, as one of his ardent admirers lately said, he can “quote by the yard.”

C. M. Schwab is doing much more talking now than when he was President of the Steel Trust, tho even then one could see him merely by sending in a card. If truth be told, Mr. Schwab was

and is probably the most democratic of all the magnates, and may be approached almost anywhere at any time. The ex-Trust President is much of a wit, and greatly enjoys a joke, whether on himself or on some one else. When the formation of the Trust was mooted I remember talking with Mr. Schwab first as to the probability of the deal going through, and secondly as to a definite report respecting a definite property. When mention was made of this property Mr. Schwab's smiling face suddenly took on a serious look. “Now, look here,” said he, “if I say something will you promise not to give me away?” Expectantly I gave the promise. “Then,” said Mr. Schwab, “just say concerning that report that there is nothing to say,” and he was off with a hearty laugh.

The last talk I had with James J. Hill was on the tail end of a Broadway car, when the President of the Northern Securities Company was standing on the rear platform, on his way uptown, smoking what he said was a ten-cent cigar—though of this I had, and still have, my doubts. I found myself on the car at Mr. Hill's invitation, having come with him from his office, where I had talked with him on Western railroad conditions. Our conversation was not finished when we reached Broadway, and hence, for the

JAMES SPEYER

reason that he was in a hurry, my free ride up town. This will readily suggest Mr. Hill's style and manner—that is, once you get his ear, for he is seldom in New York, and when there is, as he himself put it, "infernally busy" and hard to see. If you do see him you may be assured of a cordial welcome from, and a hearty talk with, this Canadian-American, who, never forgetting that he himself was a poor boy once, is much inclined to encourage and to help young men, whether in the field of finance, of journalism or of railroading.

John W. Gates is typical of the rough and ready Westerner who has made his money "easy," and who does not care who knows it. Just as often as not, if you go to see him, you will find him seated, not in his private office, but in the general office with the customers, talking freely with them and discussing the market, not as might be expected of a man who "makes" markets (as Mr. Gates sometimes does), but rather as a "hanger on" seeking information. In a general way Wall Street and Wall Street newspaper men are not so

eager as they were two or three years ago to see Mr. Gates or to give more than passing heed to his deliverances—a fact that may better be understood when it is said that, somehow or other, the market has for the last two years always gone contrary to Mr. Gates's desires and predictions, as expressed by him in public prints.

E. H. Gary, Chairman of the Executive Committee of the Steel Trust, has changed little since he first came to New York as President of Federal Steel. All the newspaper men like him because he trusts them and they him. I remember calling at his office once to discuss the

legal status of the Federal Steel dividend when, to my surprise, he spoke to me, not of Federal Steel but of art. "Do you know anything about art," was the unexpected question he put to me after a friendly greeting. When, rather uncertainly, I admitted that I had been through the Italian, French and English galleries, he said: "Good! Now come here," and leading me into his private office, he treated me to a very interesting half-hour review of the works of Rembrandt, one of whose paintings he had but a few hours before received from abroad, and which he then and there exhibited to me. So altogether entertaining

was this improvised lecture that I left the office unconscious of the fact that I had neglected to learn anything about the dividend matter on which I had started.

George W. Perkins I met only once, but that once—about a year ago—was quite sufficient for me. I had early learned that in Wall Street it is wise, when seeking information, to go to the fountain head rather than to the subordinates. Accordingly when visiting the office of J. P. Mor-

H. H. ROGERS

gan & Co. I had always sought out Mr. Morgan himself, or, failing that, his son-in-law, W. Pierson Hamilton. On the day in question, happily or unhappily, both Mr. Morgan and Mr. Hamilton were out. Inasmuch as the matter was what I considered an important one, I sent in my name to Mr. Perkins. After some delay I was ushered into his presence, and there, briefly as I could, I explained my mission. "But where are your credentials?" said he. "My credentials?" I queried, somewhat amazed. "What do you mean?" Thereupon Mr. Perkins gravely informed me that before he could talk with me I would have to

obtain a letter from my office, explaining who and what I was. Inasmuch as in all my Wall Street experience I had never used even a business card—sending in always my personal card, sometimes adding the name of the newspaper for which I wrote, sometimes not—I ventured the suggestion that my word was sufficient credential. This Mr. Perkins doubted, whereupon without ado I told him that I believed I could manage without his information, and that I would and could get all I wanted from Mr. Morgan, and I did! I cite this case because it is somewhat typical, and may show why it is that Mr. Perkins is with the newspaper men the least popular of all the men in Wall Street. Fortunately my work was of such a kind that it mattered not whether I ever saw Mr. Perkins, but with the news men—that is, the writers who treat, not the stock market and stock market conditions but the actual Wall Street news of the day—it was and is different. Mr. Perkins is practically the press agent for J. P. Morgan & Co., and gives out all the news coming from there. Newsmen accordingly must go to him. I have known Mr. Perkins to keep such news journalists waiting for two hours at a stretch and then coolly come out and tell them he had

JAMES R. KEENE

nothing to say. It is perhaps not to be wondered that under these circumstances the writers actually take delight in the fact that the only two big projects Mr. Perkins has evolved and endeavored to carry through have been failures. I refer to the Steel Trust bond conversion scheme and the profit-sharing plan of the Trust, whereby employees were "allowed" to subscribe at a price somewhat above 80 for the preferred stock, which is now around 50.

F. A. Vanderlip, the one-time financial writer on a Chicago paper, who in a few years rose to the Assistant Secretaryship of the United States Treasury, and then to the Vice-Presidency of the National City Bank, a position that he now fills with credit to himself and advantage to the bank, believes in the golden rule of doing unto others as he would have others do unto him. In his old days as a newspaper man, Mr. Vanderlip does not hesitate now to say, he was grateful to those financiers who received him cordially and helped him on as best they could, trusting him when they learned that he could be trusted (and it is a matter of record that Mr. Vanderlip never violated a confidence), and giving to him information for his paper which shortly made the gifted writer the envy of other newspaper men less fortunate in their

FRANK A. VANDERLIP

acquaintances, or less able to establish and maintain confidential relations with the then financial powers. And so it is now that when a newspaper man wishes to see Mr. Vanderlip he has no difficulty—has, indeed, but to present himself at the little barrier in the bank that separates “officialdom” from the outer world to be assured of a hearty welcome so soon as Mr. Vanderlip, remembering his own experiences, is made aware of the visitor’s presence. Then, howsoever busy this young vice-president of this great bank may be, the newspaper man forthwith obtains his information and his facts, in so far as they consistently can be given, and departs on his way rejoicing. Mr. Vanderlip is said to enjoy President Stillman’s confidence more than any other officer in the bank. If you ask any newspaper man you will learn that the unanimous opinion is that this confidence is well bestowed and well guarded.

Jacob Schiff, the head of the house of Kuhn, Loeb & Co., is a most unassuming man—the very last, one would think, to plan so daring and so gigantic a scheme as the purchase of sufficient Northern Pacific stock in the open market to wrest control of the system from the Morgan interests. But as one comes to know him better one comes more and more to appreciate the vigor of the man—the great power of his mind, his calmness in financial battle and the masterful manner in which he carries his financial corporation projects to completion. He always seems to have something in reserve—appears ever at the most unexpected times to be able to play the winning trump card. And just as he has this reserve force in business, so in

his conversation (I mean in respect to business affairs) you always feel that he could tell you more if he would. The truth, however, is that the average newspaper man is usually so glad to get even a word out of Mr. Schiff that the feeling at the conclusion of an interview is one of rejoicing that anything has been gotten rather than of regret that more has not been obtained. For, be it known, Mr. Schiff is not given to talking—certainly not for publication. In recent years only one newspaper man seems to have been able to draw him out to any

extent, but even then there was not much to boast of. As compensation for this it may be said that when Mr. Schiff is prevailed upon to say anything his remarks are at once vigorous and illuminating, and are in no danger of being hidden in an out-of-the-way corner of the newspaper fortunate enough to obtain them. Only let Mr. Schiff be personally and deeply interested in the subject matter about which he talks and there will be no lack of interesting “copy.” Newspaper men who had the good

JOHN W. GATES

or the bad fortune to be in the Street at the time of the Northern Pacific “corner” will readily attest to this. But in the broad sense it may be said that Mr. Schiff, always affable and approachable as he is, is nevertheless decidedly secretive, either declaring that he has nothing to say, or referring the scribe to his son or to a junior member of the firm.

James Speyer is a mild-mannered little man, who looks more like a youth of 25 years than one of the foremost bankers of the day. When first I met him in his office I recall the look of amusement on his face when, quite innocently, I pro-

ceeded to explain to him that there must be some mistake—that I had asked for the head of the house; for little did I dream that this boyish tho forceful-looking man was the James Speyer who at that time was controlling the destinies of a number of great industrial and railroad corporations, Southern Pacific among the number. Mr. Speyer is like many of the other leaders in the Street in that he takes into his confidence the newspaper man whom he trusts, and talks to him freely. On the other hand, when he has learned by bitter experience that a writer or his paper is not to be trusted he becomes instant-
er as the Sphinx, nor can anything move him to discuss the matter on which the reporter may have come. Smilingly but none the less decisively Mr. Speyer will then declare that he has nothing to say, and there the interview will end for the unfortunate writer. I know personally that time and again Mr. Speyer has regretted the necessity of such procedure, for at heart he is much disposed to help "the boys" along. But with him principle is principle, just as business is business. If newspaper men fail with him it is their fault, not his.

H. C. Frick seldom goes to Wall Street, and when there is hard to find. My first meeting with him was at an uptown hotel, when he and Judge Moore had an option on the Carnegie works—an option that later fell through, resulting not only in the open rupture between Mr. Carnegie and Mr. Frick, but in the final formation of the Steel Trust. My next meeting with him was at the same hotel about a month later, when, to my great surprise, he said to me, "By the way, don't be surprised if you get a let-

ter one of these days from the editor of the Pittsburg ——" (mentioning the paper). "He wants a New York representative, and I thought it would do no harm to put in a good word for you." Nor was the Iron Master satisfied with this, for at the conclusion of my talk with him he extended to me a most cordial invitation to visit the works in Pittsburg, and insisted that I be sure to look him up personally if I desired to go through. This sounded so much like "jollyng" that I took the talk with many mental reservations and a liberal supply of salt. When a few days later the post brought

me a letter from Pittsburg with the very offer to which Mr. Frick had alluded, my doubts were speedily dispelled. That was some three years ago. In succeeding days I had occasion to see Mr. Frick only rarely, but on each occasion that I did see him he was as charming and as friendly as when first I met him. My greatest regret was that he had not been a Wall Street man so that, whether he wished it or not, I might have cultivated him, for to me he has ever ap-

peared as one of the kindest and gentlest and noblest men I have met.

A man much like unto Mr. Frick is Roswell Miller, the ex-President of the St. Paul Railroad and now Chairman of the Board—the builder and developer of what is now regarded as the most conservatively and most ably managed railroad in the country. Every newspaper man in the Street likes Mr. Miller. One may see him at almost any or every hour and be assured of a frank and honest statement of fact.

Samuel Sloan, the "Nestor of Finance," is surrounded by as little red tape as any "big man" in the Street, his office

JACOB SCHIFF

being always open to his newspaper acquaintances without even the ceremony of an introduction by a private secretary or attendant. Charles S. Mellen, formerly of the Northern Pacific, but now with the New Haven, and W. H. Newman, of the New York Central, are also easily reached and, with the newspaper men, are highly popular.

It is perhaps not necessary further to particularize. The one fact that

GEORGE W. PERKINS

KINGSTON, ONTARIO, CANADA

stands out conspicuously is that howsoever these men may differ personally they are alike in this respect that, pressed with business and weighed down with cares as they may be, they are not so rushed that they cannot turn their hand to something new—they are seldom so engrossed that they are not able to give a moment or two to any one who appears to have reasonable warrant for intruding upon them.

The Protest of an Anarchist

BY JOHN TURNER

[We discussed two weeks ago the law under which Mr. John Turner, the English anarchist leader, was arrested for deportation. We are glad to publish Mr. Turner's own protest, written in the detention cell on Ellis Island, and addressed to the American people, against a law which excludes immigrants or visitors to this country simply for their opinions' sake.—EDITOR.]

I SUPPOSE it is now generally known that my arrest and intended deportation is not on account of committing or inciting to any crime. It is simply because I am an anarchist—because I believe it possible for the highest social order to be developed without territorial government. My political ideal is, human society free in all its activities, feeling its responsibilities—ready to live up to the highest it can conceive of—but rejecting organized force to compel others to conform. While these are my opinions, I was not expressing them when arrested. For years I have been actively connected with the Trade Union organization of Shop Assistants (retail

clerks) of Great Britain and Ireland. My lecture was on "Trade Unionism and the General Strike." It necessitated an historical survey of the Trade Union movement, pointing out that as the organization of both employer and worker developed, when strikes did occur, they became more sweeping in their operations and would be likely to culminate in a general strike or lock-out of the wage earners.

Imagine, therefore, my surprise when placed under arrest. It had nothing to do with what I had said or done. The warrant had been issued in Washington before I had spoken in public, on information received that I, an alien, was

an anarchist in the United States in contravention of the new Immigration Law of March, 1903. Had I been considered a dangerous man in England, France or Belgium, I might have expected something of the sort. But I had attended the International Congress of Retail Clerks and Commercial Travelers in Brussels only a week or two before, as I have attended other conventions in Paris and elsewhere.

For twenty years I have taken an active part in intellectual and labor movements in England, but any fighting disposition has always found expression in debate on, or the advocacy of, first principles. This is due, perhaps, to my semi-Quaker descent. The manner of my arrest and the so-called special inquiry were such as to create contempt in the mind of any rational man. It seemed so grotesque that, tho I did not fail to recognize the seriousness of the affair in general and to myself in particular, I could not resist a chuckle. In the first place, it was evident that those who made the arrest were of the opinion that something desperate might happen. Over twenty fully armed men and a lot of secret service and uniformed officials were employed to effect it. When, at the police station, the most dangerous weapon found on me was a penknife, at first an incredulous and then a disappointed look took possession of the officer. As in England it is quite unusual to carry firearms, no hip pocket is made, unless specially ordered, and a secret service man searching me became vulgar on his inability to find even a pocket for a gun. Naturally I was tickled at this shock to their hopes and anticipations.

The special reporter, who had been brought along to describe the dramatic event in the interests of the officer, evidently belonged to the new school of journalists, who are expected intelligently to anticipate events to come, and had secured some copy in advance. Accordingly, among other ridiculous things which appeared in print was something like this: "The secret service men had had him under observation in New York for weeks, but had refrained from arresting him, preferring to catch him with the goods on him." I take it this implies they had anticipated finding something

on me which I ought not to have. Of course, I regret that I could not oblige them.

After a rumbling ride in a patrol wagon, filled with armed attendants, and a run down the river in a launch, we arrived just before midnight at Ellis Island. I was taken down to the basement of the immigration station and locked in the center one of three cages, which, I afterward discovered, had just been erected for any insane immigrants who become violent. Here in this cage, like those for wild animals in a zoological garden, with open bars back as well as front, a cement floor and a pair of rugs, I was left to meditate upon my first arrest. The next day I was taken before Commissioner Williams and later before the "Board of Special Inquiry."

All through this wretched business I have found the Commissioner all that one ought to expect in a responsible public official—keen, businesslike, yet always courteous, reminding me very much of the employers I frequently came in contact with in England when interviewing them on behalf of the members of the union. He has done everything he could, compatible with his duty, to make me comfortable during the months of my detention in these depressing quarters. My guards and all here have treated me with the utmost courtesy. I am locked in a cage 9 x 6 feet, strong enough to hold an elephant, and am guarded night and day, tho I am staying here to allow the case to be appealed, when I might have returned to England.

The strange procedure of this "Board of Special Inquiry" puzzles me. In 1896 I made a tour of this country, where I have three brothers, one a citizen for nearly twenty years. No one then thought of questioning my liberty. Now I am arrested under a new law which makes certain opinions a bar to entering. I am excluded because the law imposes certain standards of opinion, of beliefs and disbeliefs. A dishonest man can easily assume any opinion desired; an honest one cannot change to order the slowly formed convictions of maturity. My arrest is the first case under the new law, and illustrates its operation. I was arrested on a warrant from Washington, issued by the chief of the department, as

an executive official, and am then subject to the testimony and judgment as to deportation of the subordinates of the same officer who issued the warrant. What chance has an alien who has no knowledge of the law or the country, who is tried and sentenced without being allowed to communicate with friends or to obtain the advice of counsel? I lack legal training, but as a layman it seems an arbitrary way of proceeding, one in which the elementary principles of common law are ignored. Still it is not the administration of this law that matters so much; it is significant as legislation, showing how reactionary the Government of the United States of America is becoming.

In England the law does not concern itself in the least with opinions, any more than with motives. Only acts are amenable to it. But, apparently, the country that once rebelled against England's tyranny can show her how to introduce political discrimination, which, if successful, must end in the extinction of liberty.

The spirit of the inquisition is by no means dead. Every steamship company sailing to United States ports now asks intending passengers, among other questions, "Are you an anarchist?" If any one replies "Yes," they will refuse to carry him, as he can be denied admission. It is very easy to say "No," however, and since opinions are unknown unless expressed, the law is quite inoperative for those who are not publicly known, if they can be dishonest and deny it. Neither does this law prevent people with sinister intentions from entering. But it does create a most vicious precedent. If this goes unchallenged, how long before other opinions will be placed on the list? One by one, all those who do not comply with the desires of the party in power will be denied admission,—at least those who

are honest enough to avow these interdicted ideas. It is the beginning of a new political tyranny, in which America, with its democratic institutions, can give points to monarchical Europe.

What is the meaning of this reaction? Whenever privilege is in fear it falls back upon force to sustain it. Old weapons discarded when the social relations are such that no one is afraid of their being discussed, or of new ideas being propounded, are refurbished anew, to uphold institutions growing morally decrepit. This desire for repression takes the place of political change for the better. From aliens it will extend to citizens. It is the eternal struggle of the old against the new, in which the new, beaten again and again, ultimately triumphs, only, however, to be replaced in its turn. This reaction has been remarked by some of the best scientific thinkers. They see that civilization is not progressing as it ought. Alfred Russel Wallace, speaking of the last century, compares "the astounding progress in physical science with that of government, justice and the entire moral organization," which, he says, "remain much in a state of barbarism." Ernest Haeckel indorses this and says:

"An entirely new character has been given to modern civilization by the application of knowledge in science, industry and commerce, while we have made little or no progress in moral and social life; at times there has been serious reaction."

Is America prepared to go in for the latter? Have Americans so little faith in the principles of liberty they profess to love? If so, her institutions have become rotten before they are ripe. Personally I cannot credit it, and tho I may be deported, I shall look for her return to more robust principles by abrogaing this insidious interference with freedom of opinion.

ELLIS ISLAND, N Y.

The Opportunity of the Democratic Party

BY HON. BIRD S. COLER

FORMER COMPTROLLER OF THE CITY OF NEW YORK

THE Democratic Party of the United States is to-day face to face with a great opportunity. The chief issues of the national campaign of 1904 must of necessity be questions of vital and far reaching importance. The policy of the present Republican administration is leading the country into strange paths and toward results no man can foretell. We are departing from the teachings of the fathers of the Republic in a mad rush to prestige as a world power. The time is fast approaching when we must halt for sober and intelligent counsel, and all eyes are turning to the Democratic Party as the basis of organized conservatism.

It has been said with show of reason that the opportunity of Democracy is the folly of Republicanism. To-day the folly of the latter is becoming a menace, if not an immediate danger, to the permanence and perfection of our institutions. For almost seven years extravagance and favoritism in the conduct of the national Government have run riot. More nations have been ruined by the personal ambitions of their rulers than by their dishonesty; yet to-day we are facing even graver dangers. When a neighboring republic is divided overnight with the sanction and under the guns of the United States it is time to pause and reflect.

Since the adoption of the Constitution the great human events in the history of the United States, with the single exception of the Civil War, have been the work of the Democratic Party. Jefferson, the founder of Democracy, gave us the Louisiana territory without war and without injustice to friend or foe. Monroe, another great Democrat, pledged the nation to protect the weak among struggling democracies throughout the hemisphere. In a day the Republican Party distorts the great human doctrine of Monroe into a policy of national aggrandizement and unwarranted dictation.

The republics to the south of us, in a certain sense our wards, trusted this country, and under Democratic Presidents they never had any cause for fear

BIRD S. COLER

or suspicion. Have we grown so great that we may in a day change might to right? The overnight recognition of a seceding state, as was done in the case of Panama, establishes a party policy and creates a precedent in national affairs at variance with all previous custom and contrary to our best traditions. An able thinker recently said that the age is past when a freebooter attitude was popular with or even profitable for a nation. Imperialism must not be called expansion, nor thievery be labeled diplomacy. Expansion means that the Constitution must follow the flag, while imperialism means

taxation without representation, and dependencies for revenue only. Already the people are asking how far an Administration may go upon such dangerous ground without action by the Congress.

But the new methods in our so-called diplomacy at present merely share in public attention purely domestic questions. They do not as yet overshadow, and they cannot conceal, the grave scandals they have grown up at home. The Post Office Department, that branch of the national Government that reaches into every home in the land, to-day stands disgraced by the exposure of crimes and conspiracies in comparison with which the Star Route frauds and the Credit Mobilier pale into insignificance. Into every branch of the Government there has been introduced openly, or insidiously, the miasma of fraud, favoritism or questionable methods. The Constitution has been ignored or interpreted to permit or excuse every form of personal advancement, or partisan advantage.

Trusts and monopolies have flourished, and illegal combinations of capital have been fostered and protected. We have endured a long period of government by the few for the favored and against all the rights and protests of the masses. Tariff taxes have been maintained at outrageous rates to provide revenue to support ever increasing extravagance of administration. A detailed account of the dangerous tendencies of Republicanism long intrenched in power would be beyond the limits of this article. But the facts are so apparent, they have been so brazenly admitted and defended, that public opinion is at last becoming aroused.

Important lessons were taught by the last city and State elections. It was demonstrated beyond question that the political tendency of the times is again toward strict party organization and clearly defined policies. Combinations of parties and hybrid factions, with compromising and equivocal platforms, were defeated. Individuals who by error or deliberate intent sought to disrupt or destroy organizations suffered a similar fate. Everywhere there was evidence of a return from ism and factions to party

lines. The general tendency, too, was in the direction of conservative Democracy, and therein lies hope and encouragement for the party.

In the last elections there were no victories for individuals who set themselves above their parties. In that fact may be read a sign of the times and a valuable lesson for those who lead in political thought and party organization. The Democratic Party has too long been weakened and at times almost disrupted by what may be described as a clash of individuality. The time has come to put the policy above the man, the party above the faction. There is opportunity and certainty of success. This is not a time for abstract or personal discussion of factional idcals, sometimes classed as Bryanism or Clevelandism.

To-day there is no man in the Democratic Party who in strength of intellect or record of achievement towers so high above all others as to possess a preferred claim to the nomination for President. A spirit of unrest pervades the country, a vague, but constantly growing fear of the consequences of a prolongation of government under the dangerous and ever shifting policies of the Republican Party. In every great crisis in the history of the country patriotic Americans have instinctively turned to one of the great party organizations for safety. To-day they are turning to the Democratic Party because of their faith in its ultimate wisdom and conservatism. It is the party of the people, and their reliance, so long as it obeys their mandates and keeps their policy above the hopes or the ambition of the individual.

This is a time for the Democratic Party to devote all its energies and mental capacity to the perfection of a wise policy for the future government of the country. It is not the time to search for candidates. Great occasions produce great men. The platform, not the candidate, will win or lose for the party at the next election. The mistakes of the past cannot be undone, but they should not be repeated. This year the party cannot do better as an initial step toward wisdom and harmony than to elect all delegates to the next National Convention without instructions for any candidate for the nomination for President.

Then in convention, untrammelled discussion of the situation by representatives of all sections and interests of the country, would surely lead to modification of all extreme views and a satisfactory agreement on a wise and winning policy. The present situation of the country seems to clearly point out the issues upon which the Democratic Party must base its national platform. To avail itself of the great opportunity presented the party must oppose with the overwhelming force of wise conservatism a continuation of Republican extravagance, corruption and favoritism, as well as reckless and ever-spreading imperialism. Honesty and economy in administration and reform of the Republican tariff are essential principles of Democracy. But in this critical time of the spread of the world power idea the party must, above all things, pledge in convincing words the preservation inviolate of the national good faith. The keeping of that faith must not mean or imply that we shall cringe before a great Power, but with equal force it must mean that we shall not destroy or disrupt a weak or helpless republic. National honor in all things should be held as sacred as the honor of the individual. If the republic departs from the rule of common honesty it must not expect the citizens to remain virtuous.

In the creation of a platform the Democratic Party must ever remember that the national currency and the financial credit of the country are matters with which no party can trifle with hope of success at the polls. The credit and financial responsibility of the country must at all times and under all circumstances be maintained inviolate. We are not yet enough of a world Power to set up one standard of currency against all other countries of the earth. A trust or monopoly can thrive and oppress as well under any form of currency; all they will have to do is to ask for more of it.

The Democratic Party must in the next national campaign commit itself to some definite policy in regard to the regulation of illegal and dangerous combinations of capital, combinations that rob the many for the profit of the few under the guise of law, and the reality of Government protection. Monopolies dealing in the commodities of life have been strictly

owned and held by the few who created them, while the great manufacturing and commercial industries have been over-capitalized and foisted upon the public at enormous prices, only to be rebought in times of disaster from the victims of the originators; hence the earnings of the laborer must again decline without a comparative decrease in the prices of the necessities of life. In this matter no taint of socialism and no suggestion of anarchy must intrude.

The next national platform of the party must be a declaration for action. The Democratic Party has been called the party of opposition. The time has come when it must be positive. The platform must stand for the soundest and best currency. It must declare in terms that cannot be misunderstood for an immediate revision and reduction of the tariff. Supporting the broadest and best spirit of Americanism, it must at the same time pledge the party and the country to unalterable opposition to foreign conquest and to taxation without representation. The platform must in the strongest terms condemn every form of socialism and anarchy, and in this positive declaration for law and order all elements of society must stand equal before the law. Monopolies that have flourished under Republican favoritism until they hold themselves above the law must be forced to realize that they are the creatures, not the creators, of the Government. The platform of the Democratic Party must demand the immediate enactment of Federal laws for the thorough inspection and regulation by the Government of every form of monopoly. This can be done by publicity, enforced, if necessary, without injury to any legally vested right.

The great corporations, created by Government favor or permission, must not be destroyed by an edict, because too many personal rights and interests are involved. But the creature of Government must, in a democracy, be ever subject to the control and regulation of the creator. Trusts and combinations of capital must at all times be regulated and controlled by a system of publicity and government inspection. When a government is no longer able to regulate that which it created its power is on the wane. In a democracy the power of the govern-

ment, created and sustained by the people, must be at all times supreme.

One of the great follies of the Republican Party is that it has carried the spirit of commercialism right into the inner sanctuaries of national government. Might has been made right, and personal favor has been enacted into law. Against such a policy the best interests of the country are in revolt, and to-day they are looking to the Democratic Party for relief. Business and financial interests everywhere seek for a safe and sound conservatism in parties and governments. These great interests, the material life of the country, do not look to any individual for succor and protection. They know that the issues involved are greater than any man, and they look to a party to save the country.

The Democratic Party is to-day face to face with the opportunity to return to the teachings of the fathers of the party and the country. Following in the good old ways of Jefferson, Jackson and Tilden, the party will win the next national election, and its lease of power will continue so long as it walks in the paths of truth, honesty, honor and fair dealing at home and abroad. But the party and the true principles of the party must be placed above individual ambition or striving individuality. No man is supreme, none is indispensable. All must be for the State, none for the man. Returning to the ways of the fathers, we shall win; departing from them, we shall again lose a great opportunity. To-day true Democracy is the hope of the country.

NEW YORK CITY.

The Men for Life Insurance

BY GAGE E. TARBELL

VICE-PRESIDENT OF THE EQUITABLE LIFE ASSURANCE SOCIETY

THE kind of men desired in life insurance? The best kind. The highest grade of men that can be found. There is room for a larger number of that class, in my opinion, in life insurance than in any other one business that engages the energies and talents of mankind.

It is exceptional facilities that both attract and develop exceptional abilities, and that is just what this business presents: exceptional facilities for exceptional abilities. It never says to a man, "You can go so far and no farther. The limit that you can make is so many thousand dollars per annum." On the contrary, it says, "Go ahead! Climb! There is no stopping place. The field of your endeavor has no boundaries; your aspirations need have no limit." In other words, what a man can make in this business depends wholly and solely upon how hard and how intelligently he works.

Is it any wonder that a calling of this character is attracting to it the best in-

tellects, and those rare men who are in very truth storage batteries of energy which cannot find scope enough in many other lines of business. *There is plenty of room for them in life insurance.*

I became convinced some time ago that there was one source from which life insurance companies could secure men of the character they wanted, which had been sadly neglected. This was the colleges and universities of the country, which are annually turning out several thousand young men, with the choice of a career before them. While I do not feel that a college education is absolutely necessary, and while many of the strongest and best life insurance agents in the country have not had the advantage of such an education, it is perhaps true that the same man is a stronger man by reason of a university training than he is without it. I therefore several years ago conceived the idea of having a Summer School of Life Assurance, composed of picked graduates of the current year,

Copyright, 1903, by Alman & Co., N. Y.

GAGE E. TARBEILL

from colleges all over the country. As soon as practicable I actually established such a school for the Equitable at our home office building. There the young men that we had selected were instructed in the principles and practices of life insurance, and then sent out into the field equipped for getting business.

My purpose in this was two-fold: first, it opened up a wide and lucrative field to a large number of young men on the threshold of their career, giving them opportunities such as would rarely come within their grasp otherwise; and, second, it enabled us to make annually a substantial addition to our forces from

among the youth of the land well equipped to make a valiant fight in the battle of life.

In connection with this matter we have been favored with the co-operation of many of the leading institutions of learning throughout the country, and I have noted with much satisfaction that since the establishment of our summer classes a number of universities have taken up the matter of life insurance, and either made its study a part of their curriculum, or arranged for a series of lectures upon the subject.

Thus it will be seen that the move has proven to be a popular one, and its scope will doubtless be far-reaching. The results accruing directly from our own classes thus established have been so very gratifying and satisfactory that we have decided to make the summer school for college graduates an annual feature in the policy of our Society.

To recapitulate, I would say that the men desired in life insurance are men of the highest character; the most intelligent, the most energetic, the most determined, the most keen, the most ambitious that can be found. Men who are full of *work*, no idlers or triflers—they can eke out an existence in something else. Life insurance wants men worthy of its *largesse*! men who are not satisfied with a pittance—*Live* men. No “dead ones” wanted here. Big men. Men of the hour. Progressive men. Men who want to do something more than the ordinary. Men who want to grow and are willing to help their growth by any amount of push and hard work.

Those, briefly, are the men that life insurance wants.

NEW YORK CITY.

At Herod's Gates

BY THOMAS WALSH

SORT in the moonlight sounds the drowsy lute
Through Herod's halls; the flaming censer
throws

Its yellow gleam upon the banks of rose,
Where lies the monarch's form serene and
mute.

Long to the courtyard fountains' monotone
The Asian lute repeats its tale alone,
The while Zuleika smoothes his perfumed
beard

And vainly smiles as tho she nowise feared.

Then at his feet an Ethiop bending low
Brings tidings:—"By the outer gate there
stand

Three aged strangers from some foreign land
Who crave my lord's fair guidance ere they go."
"Am I their sign-post, slave?" the Tetrarch
cried.

"Nay, master, but like drunken seers, they ride
Three hungry camels; they are kings, they
say,
And would but question of their royal way."

"Admit them, then," the master's head in-
clined;

"On with the music; set some lamplight
where

It will reveal these graybeards and prepare
For merrier moods, for by the stars, I find
The night grow irksome." As he spoke there
came

His Ethiop with the strangers; and the flame
Fell on their mighty shoulders bowed with
years,

Great beards and eyes that glittered sharp as
spears.

Gravely the foremost bent his head and spoke:
"Thou seest in us, great Herod, monarchs
three,

From lands o'er many a mountain—many a
sea;

And these torn garments—"then a titter broke
The silence and the clowns and dwarfs were
heard

To prod each other's ribs at every word,
Until their master, holding back his smile,
Lowered his brows and silenced them awhile.

"These faded robes and our foot-weary beasts
Are all that now is left of kingly show,
Of slaves and vested pomps we once did
know,

Ere scorning idle thrones and tawdry feasts

And all the hollow mockery of things
Bedecked and tinselled for the eyes of kings,
We hastened forth upon our quest afar
To find the King—the King that sent the Star."

An old dwarf chuckled sitting in the crowd,
"Egad, a pretty pack of mad-head sires!"
Meanwhile the yawning Herod's voice in-
quires,

"What star, my kings,—if question be al-
lowed?"

"Why, but yon glorious star," the stranger
said;—

"Nightly it comes and beckons o'er our head."
Then Herod gazed and said,—
"In truth I see
Your star, but heaven shows many such for
me."

"Ah, then, hast thou forgot the sacred writ—
How unto Bethlehem a Star shall lead
What time that He—a king and lord indeed—
To Judah's tribe shall come.—Thou knowest
it?"

"Yea, 'tis an old time legend," Herod sighed;
"But come, partake of food—the star will
bide—

And succor from your lands o'ertake you soon"
The old dwarf jeered—"They'll bring it from
the moon."

"Nay, we must on; my brother kings and I
Have left all earthly hunger far behind;
No weariness can reach us; we are blind
To all save that star-promise in the sky.
So shall we go, since here no tidings fair
Of Him we seek be granted to our prayer;
And we must haste while still is mirrored
bright,
Within our souls that Star which guides aright.

"What ho, good slaves! lead ye our camels out!
And you, fair prince, may all your dreams be
bliss—"

But Herod spoke aside;—"Some wild hunt,
this
For moonshine! They are mad, without a
doubt!"

Then as they turned to go the dwarfs danced
round

To pluck their rags and beards to glee-bells'
sound;

Yet Herod, while the rout was maddest, mused:
"A King, they said? That was the word they
used—"

Literature

Senator Hoar's Reminiscences

IF, in the freedom of familiar intercourse with friends, a public man of long experience fell to talking of the great personages he had met and the great problems he had helped to solve, and some hidden stenographer took down the unforced droppings from his lips, the result would be something like Senator Hoar's "Autobiography of Seventy Years."* There is a special charm to anything Mr. Hoar does, in the simplicity of style which accompanies his simplicity of thought. There is not in this book a sign anywhere of the reviser's pen. The sentences apparently have formed themselves, and followed one another along till a change of subject has called for a change of chapter; and that has been all that the author has done in the way of preparing his two volumes for the press.

Had more elaboration been expended on the work, possibly so much of Mr. Hoar himself would not have shone through its pages. As it is, we see him everywhere. With charming candor he tells us in several places how it has come about that, albeit at sword's points with the policy of his party on so many occasions, he still remains an ardent Republican. For example, referring to his support of McKinley for President, in spite of the latter's Philippine policy, he says:

"In determining whether it is your duty to forsake a party which is wrong on some single question, you are to decide, first, whether that question is important enough to warrant sacrificing every other measure in which you agree with your party, and having every measure espoused by the other, which you think bad, enacted if it get control. Second, you have not only in such a case to sacrifice every other thing you think desirable to prevent the one thing you think undesirable, but you must decide whether, in regard to that particular matter, the party you are asked to substitute in power for your own will accomplish what you desire if it get power. . . . The Republican free-trader who

voted for Mr. Cleveland in 1892 did not get free trade. He got only what Mr. Cleveland denounced as a measure of infamy. In the third place, you have under our Constitutional system to determine whether the chance to accomplish what you want in regard to one measure warrants placing political power in hands you deem unfit."

Mr. Hoar gives us to understand that, in his own judgment and others, he is able to do more for the "heterodox"

GEORGE F. HOAR

causes he has espoused by remaining a Republican than by going over to the Democrats. The extreme to which he carries his party loyalty, however, is almost childlike in some of its phases. Most Democrats with whom he has served in Congress appear to have worn off the sharp corners of his prejudice, but all others are viewed, as a rule, with serious suspicion. Mr. Cleveland, for instance, appears never to have done anything right, and to have been responsible

* AUTOBIOGRAPHY OF SEVENTY YEARS. By George F. Hoar. Two volumes. New York: Charles Scribner's Sons. \$7.50.

for the bulk of the bad things done by other members of his party. No mention is made of his bold stand against the railroad rioters, or his successful effort to repeal the silver purchase law, or his brave struggle to hold back the Democratic reactionaries at various stages. On the other hand, Mr. Hoar tells us that "the two administrations of President Cleveland are remembered by the business men and the laboring men of the country only as terrible nightmares." The Republicans, he says, generally believed "that the Presidency itself, when occupied by Mr. Cleveland, represented nothing but usurpation, by which, in large districts of the country, the will of the people had been defeated." "The last vestige of the national statute for securing purity of elections," he assures us in another place, "was repealed in President Cleveland's second administration," instead of mentioning which Congress passed the repeal. He speaks of a seat on the Supreme bench as "an office which ought to be absolutely non-partisan," and yet rebukes Mr. Cleveland for nominating Hornblower and Wheeler Peckham "without consulting Mr. Hill, who . . . knew the sentiment of the majority of the Democratic party." He believes that Cleveland was counted into office in 1884, altho Blaine really carried New York State. And his only real grievance against Carl Schurz is for his "supporting Mr. Cleveland, and contributing what was in his power to the defeat of the Republican party on two occasions—a defeat which brought so much calamity to the Republic."

Speaking of Mr. Schurz, that gentleman may learn for the first time from Senator Hoar's book how near he came to dismissal from President Hayes's Cabinet. Public sentiment in the country at large had been much aroused over the suffering of the Ponca Indians whom Mr. Schurz had removed from their northern home to the Indian Territory. President Hayes called on Mr. Hoar at his lodgings to talk about the affair, and under great stress of feeling brought his fist down upon the table, exclaiming: "Mr. Hoar, I will turn Mr. Schurz out, if you say so." Mr. Hoar pleaded for the Secretary, whom he regarded as misled in judgment rather than deliberately cruel, and the President relented.

The Senator draws the curtain aside long enough to give us several glimpses of inside history, as in his story of Mr. Evarts's attitude toward the Federal Elections bill. Mr. Evarts approved the underlying principle of the bill, but doubted the wisdom of legislation which would excite so much strife throughout the country. He was at last moved to action by recalling Judge Kent's remark to a friend who went to church with him but fell behind everybody else with the responses. After service the Judge suddenly broke out: "Davis, why can't you descend into hell with the rest of the congregation?" Mr. Evarts decided that he would descend into the pit with his party, and the stand he then took he held loyally throughout the fight.

On the Philippine issue, which marks his greatest break with his fellow Republicans, Mr. Hoar says that the Democrats, as a party, "never meant business"; and he adds:

"I said to one eminent Democratic leader early in the year 1900: 'There is one way in which you can put an end to this whole business. If you can elect a Democratic House it will have power under the Constitution to determine the use to which the army shall be put. In that way you compelled President Hayes to refrain from further support by military force of the Republican State Governments in the South.' He answered: 'Mr. Hoar, we shall never do anything as radical as that.' . . .

"I think the Democratic party feared the fate of the Federalists who opposed the War of 1812, and of the Democrats who opposed the war for the Union in 1861."

The argument used by Bryan to procure votes for the treaty of 1898 was:

"That the Democratic party could not hope to win a victory on the financial questions at stake after they had been beaten on them in a time of adversity, and that they must have this [Philippine] issue for the coming campaign. . . .

"In my opinion, if he had been elected, he would have accepted the result, have put the blame for it on his predecessor in office, and matters would have gone on very much as they have under Republican control."

All the cowardice, however, Mr. Hoar does not charge upon one side. He declares that enough Republican Senators have told him of their great regret at voting in the affirmative, to have defeated the treaty by a majority if they had voted as they felt.

Senator Hoar, it may be recalled, presided at the convention that nominated Garfield for President in 1880. He exonerates Garfield from the charge of dishonorable conduct in accepting the nomination when he had come there pledged to Sherman. He describes him as rising to a point of order after the thirty-fourth ballot had revealed several votes for him, and saying: "No man has a right, without the consent of the person voted for to announce that person's name, and vote for him, in this convention. Such consent I have not given —;" and himself as interrupting him from the chair with: "The gentleman from Ohio is not stating a question of order. He will resume his seat." And the Senator continues:

"I recollect the incident perfectly. I interrupted him in the middle of his sentence. I was terribly afraid that he would say something that would make his nomination impossible, or his acceptance impossible if it were made. I do not believe that it ever happened before that anybody who attempted to decline the Presidency of the United States was prevented by a point of order, or that such a thing will ever happen again."

Mr. Hoar's *Seventy Years* is nearer seventy times seven, if we go back with him the overlong period of which he gives us an outline in the introductory part of his first volume, where he chats pleasantly about his ancestry. After reading these passages it is not difficult to see how he came to be the man he is, with notable members of so many generations stamping their impress in advance upon the finished character and personality we know.

London's Inferno

MR. JACK LONDON is earning laurels in many fields. His latest work, "The People of the Abyss,"* can only add to a reputation already deservedly high. It relates his experiences during the summer of 1902, when he went "down into the underworld of London" to study the life of the miserable denizens of that Inferno. This life has been pictured many times before, complacently and

soothingly by Prof. Walter A. Wyckoff, luridly by Mr. Stead, scientifically by Mr. Charles Booth. But Mr. London alone has made it real and present to us. He has followed the injunction of old King Lear:

"Expose thyself to feel what wretches feel," and by so doing has seen their tortured existence out of their own eyes, and has so qualified himself to present it to us in a series of striking pictures.

"There is no place for them [the people of the abyss] in the social fabric, while all the forces of society drive them downward till they perish. At the bottom of the abyss they are feeble, besotted and imbecile. If they reproduce, the life is so cheap that perforce it perishes of itself. The work of the world goes on above them, and they do not care to take part in it, nor are they able. Moreover, the work of the world does not need them. There are plenty, far fitter than they, clinging to the steep slope above, and struggling frantically to slide no more. In short, the London abyss is a vast shambles."

From this broad characterization of the people of the East End Mr. London proceeds to a description of their homes, their occupations and their daily life. It is a pitiable and tragic story. Such intensity of suffering is enured in no other place on the planet, and its extent is almost incredible. When it is considered that 1,800,000 Londoners are living constantly on or below the poverty line, that another million live with but one week's wages between them and pauperism, and that one out of every four adults in the metropolis dies on public charity, we may get some faint realization of the widespread distress. The time, moreover, at which he wrote was one of prosperity, and since then conditions have grown notably worse.

What is true of London, the author insists, following Mr. B. S. Rowntree, is true of all the populous centers, and to a somewhat lesser degree of the country districts throughout Great Britain. Mr. Rowntree's investigations in the city of York have already confirmed this view. And the fault, in Mr. London's judgment, is mismanagement, political and social, by the powers that be. The poor are driven downward from their birth by all the processes of trade and law, and they cannot help themselves but

* THE PEOPLE OF THE ABYSS. By Jack London. Illustrated. New York: The Macmillan Company. \$2.00.

must inevitably descend lower and lower:

"From all the land rises the hunger wail, from Ghetto and country side, from prison and casual ward, from asylum and workhouse—the cry of the people who have not enough to eat. Millions of people, men, women, children, little babes, the blind, the deaf, the halt, the sick, vagabonds and toilers, prisoners and paupers, the people of Ireland, England, Scot-

The Mother of Washington

MRS. PRYOR has succeeded in making a very interesting volume from material which in less skillful hands might have seemed but slender foundation for the handsome volume before us.* The mother of Washington was not a woman of many words, either spoken or written. She left no diary and, how-

ever many letters she may have written, few have survived the chances and changes of more than a century. Her record is not that of fashion, beauty or wit, but is that loftiest of all the records that may be left by woman, that of having given to and trained for her country its grandest man. "All that I am," said Washington, "I owe to my mother." "All that we are," says Mrs. Pryor, "we owe to him." From this there can be no dissent, for, without detracting in the least from the merits of those who so ably seconded him, his was ever the greatest achievement. Immeasurable, therefore, is the debt which we as a nation owe to the strong natured, wise, self-helpful, resourceful woman, who educated all her sons in ways of self-

NELLIE CUSTIS

From "The Mother of Washington and Her Times" (Macmillan.)

land, Wales, who have not enough to eat. And this, in face of the fact that five men can produce bread for a thousand; that one workman can produce cotton cloth for 250 people, woollens for 300 and boots and shoes for 1,000. It would seem that 40,000,000 people are keeping a big house, and they are keeping it badly. The income is all right, but there is something criminally wrong with the management. And who dares to say that it is not criminally mismanaged, this big house, when five men can produce bread for a thousand, and yet millions have not enough to eat?"

reliance, usefulness, patriotism and integrity, and from whom her eldest son inherited the strong frame and perfect health which enabled him to sustain the cares, exposures and privations of his responsible position.

It was from her, also, that he inherited the outward severity of manner and the reticence which formed the

* THE MOTHER OF WASHINGTON AND HER TIMES. By Mrs. Roger A. Pryor. New York: The Macmillan Co. \$2.50.

only unattractive characteristics of a man otherwise so fitted to command not only the admiration and respect of all mankind, but their love as well. Both General Washington and his mother were warm and large of heart, but both were often misunderstood because of the armor of frost with which they were obliged to protect themselves. A shallow nature may laugh or weep for trifling cause and be esteemed by the near-sighted multitude to be enjoying or suffering much. Strong and intense natures must in sheer self-defense put restraint upon the expression of their emotions, tho the masses will still consider them cold.

The pictures given by Mrs. Pryor of social life in Virginia before the Revolutionary War are at once painstaking and fascinating, and her style, especially after she has once settled herself well into the harness of the narrator, is admirable. The book will undoubtedly be widely read, as it deserves to be, both from its subject and its manner. The publishers have done their part equally well, as far as paper, printing and many illustrations,—some of them of a rarely delicate beauty,—can go; but we cannot say as much for the work of the binder. A book which cannot be opened for at least half its supposed capacity without causing an ominous cracking at the back is not bound as it should be.

The Mississippi Valley

WE cannot say that we altogether commend the sort of history which Messrs. Spears and Clark give us in their recent volume.* Doubtless there are many who will like it, and these will probably like it very much indeed. But for our part we wish it had been better done. It may be, as the publisher announces, that "the book was written as a permanent history, and not with the St. Louis Fair in view, as the preparations for the volume were commenced nearly three years ago." But for all that, there are plenty of apparent evidences of hurried preparation. There is a lack of

that scholarly weighing and comparing of data which is a requisite in the writing of real history; there is a lack of form, there are needless repetitions of unimportant matters, there is a wholesale duplication of sentences from Mr. Spears's "Anthony Wayne," and the diction, as a whole, is bad.

A History of the Mississippi Valley from its Discovery to the End of Foreign Domination, it is called; and the title can hardly be regarded as a scientific designation. For, in the first place, the work is not a connected and coherent history, but a series of sketches on historical subjects. In the next place, it treats not of the Mississippi Valley proper, but of Canada, Ohio, Indiana, North Carolina, Pennsylvania and Western New York as well. It slurs over what little early history the region west of the Great River had prior to the Louisiana Purchase, and it ends at the assumption of American rule over New Orleans, December 20th, 1803. Yet if Ohio be a part of the Mississippi Valley, so is the lower part of Alabama and Mississippi which was under "foreign domination" until 1812, and a good part of Texas which was under "foreign domination" until 1845.

"It is intended to be a narrative, not a critical history," say the authors. In fact, the failure to give critical examination to the data treated is conspicuous at a mere glance. Great masses of material have been used, but if the workman's tool is to be guessed by his product, one may say that it is not the weighing-scale or the crucible that has been employed, but the scoop-shovel. The carelessness or indifference shown is sometimes amazing. The account of Celoron's expedition (pp. 128-130) down the Ohio River, and through Ohio State (1749) is an example. We are led to infer from this account that Celoron marched up the Scioto, that he found "Laramie" Creek flowing into that river, and that at the confluence of the two was the Indian village which has been supplanted by the present city of Piqua. The somewhat pertinent facts that, according to the contemporary map of the expedition, he is represented ascending, not the Scioto, but one of the Miamis (probably the Little Miami)

* A HISTORY OF THE MISSISSIPPI VALLEY, FROM ITS DISCOVERY TO THE END OF FOREIGN DOMINATION. By John R. Spears and A. H. Clark. New York: A. S. Clark. \$5.00 net.

that Loramie River (not Laramie Creek) flows into the Great Miami, and that the modern Piqua is on the banks of the latter and not within sixty miles of the Scioto, are jauntily ignored. The authors cling to their Scioto to the end. "At the head of the Scioto," they conclude, "Celoron burned his canoes and marched overland to the Maumee."

Tho intended for a narrative, the current of the record is frequently swamped in far-reaching digressions. A great many pages are taken up in exploiting the late Major Powell's uncritical estimate of the North American Indian. Major Powell was a tireless investigator, and a man of high ideals and humane spirit. But his sympathy for the Indian in his present hapless condition led him to a conception of the primitive Indian which was woefully unscientific. A child of the Stone Age, he is represented as having virtues which have been developed, no matter how imperfectly that may be, only in the historic races. But the authors of this work accept the picture unhesitatingly, and incidentally rebuke Parkman for venturing to suppose that he could learn the Indian's real character by living among tribes that traded with white men. They forget the multitudinous records of first contact with the Indians, and particularly such records as the journals of Alexander Mackenzie and of Lewis and Clark, who found and described red men still uncontaminated by contact with the whites, whose observed character gives no shadow of support to Major Powell's theory. Other digressions in the work refer to labor leaders, who, it appears, are held at a most unflattering estimate, and to Thomas Jefferson, who would seem to have been a very reprehensible person.

Of the numerous repetitions in the volume, little more is to be said than that the reason for their employment is not always obvious. Matthew Arnold's reiteration of his most splendid and impressive sentences was, to a great degree, effective; but we believe most readers are of the opinion that the practice was overdone. In the case of the present reiterations we are certain. That Anthony Wayne was the best drill-master the American army ever had; that Chris-

tian missionaries transformed the Delaware Indians settled at Gnaddenhütten into "peace-loving, stump-grubbing farmers," and that certain of the "unco' guid" may not unjustly be described as persons who "once a week, with bobbing heads, mumble some sort of creed, and then live, the devil knows how, the rest of the time"—all these may be facts which need to be emphatically said. But we hardly estimate either the facts or the manner in which they are expressed at a rating sufficiently high to commend the frequent repetition of the authors' sentences.

There is another kind of repetition which we also hold to be questionable. That is the kind involved in the wholesale "lifting" of matter from Mr. John R. Spears's "Anthony Wayne" to Mr. John R. Spears's and Mr. A. H. Clark's *A History of the Mississippi Valley*. In neither volume is it credited to the other, and it therefore passes for original in both. The accounts of Wayne's campaign (1794) against the Northwestern Indians in the two books is very nearly identical. It would be entirely so in places but for the carelessness of the copyist, the printer or the proofreader, who occasionally transform or substitute a word. An alleged speech by Lord Dorchester, Governor of Canada, delivered to a council of Indians on February 10th, 1794, appears in both volumes. Here, at least, duplication should be exact. Unfortunately, the two accounts of the noble lord's remarks are different. But in one sentence they would be identical were it not that the word "country" in one appears as "conduct" in the other. A like transformation appears in one of the accounts of the battle of Fallen Timber. Almost word for word the two volumes agree as to what took place there. But the sleepy proofreader, or printer, or copyist has interposed, and the thrilling phrase, "As the long roll of the *drums* began," suffers a sea-change in the other volume to "as the long roll of the *guns* began." Thus is the patient toil of the masters marred by the bungling of the subordinates.

In other respects than those named the book may be indulgently characterized as excellent.

The Training of Wild Animals

WHEN a solitary individual brings twenty-seven lions into a caged arena and makes them perform tricks like so many trained dogs, or faces an infuriated tigress with no better shield than a wooden chair and a whip, there is something bewildering about the achievement. At all events it is a far cry from the imitation Roman warrior who used to thrill the past generation by suddenly entering a cage of sleeping beasts, frightening them by a rapid succession of pistol shots and then precipitately getting out. To explain how this is done Mr. Frank C. Bostock has written a book* which, while making no pretense to being a scientific treatise, is none the less of serious interest in its extraordinary showing of the possibilities of the domination of the human over brute will. It certainly administers a quietus to that ancient fiction, "the magnetic power of the human eye," for, as the author says, a trainer engaged in putting twenty-seven lions through their paces must constantly turn his back on some of them, and would require twenty-seven pairs of eyes if that theory were correct. The whole result seems to lie in self-control and unshakable nerves, with, singularly enough, mere physical courage in a subordinate place. The trainer must neither smoke nor drink, his patience must be constant and unweary-

ing, his physical agility, like that of the Spanish bull fighter, must be highly developed, his knowledge of the animal nature, and particularly of the characteristics of the brutes which he is educating, must be profound, and, finally, he must be able to retain perfect self-possession even when badly hurt and in extreme peril, since to permit the animal at any

Herman Mudon Defying His Fiercest Lion.—From "The Training of Wild Animals." Copyright, 1902, The Century Co.

time the slightest suspicion of its own mastery is certainly fatal.

Apart from the constant bodily risk, the work of the trainer as it is here depicted is anything but light. It involves often years of patient effort and monotonous repetition. Any variation means danger. Taming is not training. A "tamed" wild animal is simply one which temporarily has dropped its ferocity. A permanently tamed brute, Mr. Bostock insists, is "a

* THE TRAINING OF WILD ANIMALS. By Frank C. Bostock. Edited by Ellen Velvin, F.Z.S. New York: The Century Co. \$1.00 net.

chimera of the optimistic imagination and a forecast of the millennium." That wild animals are drugged and exhibited in a semi-comatose state he warmly denies. No such expedient would serve, and the actual injury done to a valuable brute would render the proceeding economically absurd. Equally, says Mr. Bostock, no cruelty is shown them, for nothing would more quickly defeat their education. A trained wild animal is simply a product of science, and may so exist until it discovers its own power. After that its training is at an end and it becomes merely a zoological specimen. A playful lion or tiger is as dangerous as a vicious one, for, having no conception of its own strength, a blow given in sport is as destructive as if made in anger. There is but one defense to a charging lion and that is to strike it on the nose from below upward. This will send it cringing to the other end of its cage, but the chances of landing the stroke are remote. A powerful stream of water from a hose to stop the animal's breathing is about the only recourse if the victim is once grasped.

Altho the fine Roman hand of the press agent is not always well concealed, the present work is very interesting, while the many excellent photographs give ocular proof of the possibilities which otherwise might stagger belief.

Colonel Carter's Christmas. By F. Hopkinson Smith. New York: Charles Scribner's Sons, \$1.50.

The friends of "Colonel Carter of Cartersville" will be glad to learn that he is the hero of Mr. F. Hopkinson Smith's new Christmas story. The Colonel is a composite of all that is charming, generous, brave or whimsical in Southern character, and since his removal by Mr. Smith to New York, he and "Chad," with their Christmas dinners and commercial confidences, have done much toward uniting the enterprising spirit of the North with the chivalric one of the South, somewhere in the wine glass regions of romantic sympathies. We wish the Colonel many happy returns of the one day in the year which he is

most fitted by tradition and disposition to adorn and enjoy. Indeed, the art of Mr. Hopkinson Smith consists, in part, of the fact that he has discovered and dramatized the hyperbole consciousness of some authentic Southern types. For, however far he Southern man of this class may lag behind in the everyday march of commonplace affairs, he has a genius for great days, his element is the extraordinary, and he has a peculiar grace for "presiding" over happy occasions that has never been surpassed even by the feudal lords of elder generations. The immortality of Colonel Carter as such a character is assured by the historical records of the South, if not often by men now living there.

George Washington Jones. By Ruth McEnery Stuart. Philadelphia: Henry Altemus Co., \$1.00.

The author of "Sonny" long ago won her laurels as an interpreter of rudimentary boy nature, and in this Christmas story she introduces us to "George Washington Jones," a small, black prodigy of courage, sentiment and "manners." Some people may doubt the veracity of the type, but no one will question the humor and tenderness of the tale, unless indeed some carping Southern critic complains that it is a trifle too tender.

The First Loves of Perilla. By John Corbin. New York: Fox, Duffield & Co.

This tiny volume, illustrated with a portrait of the charming "Perilla," is a very successful attempt to interpret the evolution of sentimentality in an up to date matinee girl through different stages until it reaches the healthy proportions of a real love for a real man. Her first loves were, of course, the male tragedians, who suffered, bled and died on this afternoon stage. At this time all her sensations are dramatic; figuratively she carries a dagger in her bosom and longs for some form of romantic sacrifice. The sketch is written with sympathy and a sort of quizzical wink at innocent, young femininity.

America in Literature. By George E. Woodberry. New York: Harper & Bros., \$1.50.

This slender volume contains a set of essays on American literature. They are very brief, very general, and they make considerable pretension to style of the highly sophisticated or Alexandrian variety. Like Walter Pater, whom he imitates in the structure of his sentences and the articulation of his thought, Professor Woodberry seems determined to write English like a dead language, preferably Latin. In this kind the following sentence is an undeniable triumph:

"The collegiate spark, which is now parceled out among museums and laboratories, and feeds an immense power-house of technical arts, applied sciences, and lucrative professions, was then rather a thing of men's bosoms, of the instincts of imagination, the guesses of philosophy, the intuitions of religion; if the University, through the inculcation of scientific knowledge and its varied training for useful pursuits, has now become more a great prop of the material state, the college discharged well its elder function as a restorer of the human spirit through the seeking of truth and under its plain academic rule, before the older order changed, giving place to new, Harvard came into vital touch with the thoughts of men, and bore once that little, unnoticed flower of the soul, whose seeds at last are blown throughout the world."

Apparently the intention of these seven pieces, which are collected from *Harper's Magazine* and *Harper's Weekly*, is not critical but belletristic; and tho to him who reads them as a rhetorical elaboration of familiar truth they may furnish agreeable entertainment, yet on the whole they come as a decided disappointment, for it seems as tho one had a right to expect serious criticism from Professor Woodberry, if from any body. At the same time it is only fair to add that these papers contain a number of ingenious *aperçus*, such as the distinction between the original expression of literary feeling, which creates and is individualistic, and the sympathetic expression of the same feeling, which appropriates literature and is social. Of Lowell he shrewdly remarks that "he did not work hard at either prose or verse." And occasionally he sketches a literary character rather cleverly, if not always correctly, as in the case of Hawthorne, "whose genius," he declares, "involved . . . a reversion

to the Puritan past," and "worked in a reactionary way," and to whom "it was his art that was necessary . . . not its message." At such moments as these, when he is thoroughly familiar with his subject and thoroughly interested in it, he forgets his manner and writes simply, clearly and forcibly, like any one else. Nor is he to be commended least for taking an exclusively artistic survey of that "immeasurable froth ocean" of writing with which the historians of our earlier life have nearly swamped the conception of American literature. Without some such sharply discriminative test it is impossible ever to establish a sound literary tradition in our country.

Optimism. By Helen Keller. New York: C. P. Crowell & Co., 75 cents.

This essay is worthy of attention because it is a broadly intelligent, thoroughly considered presentation of the theme in a brilliant literary style; but that Helen Keller should have discovered and affirmed by her own experience this sunlit gospel upon which the progress of the world is based is a fact worth of particular attention. Not only is life thus presented to her in the form of a divine energy, but that which actually startles the reader is the courage with which she has leaped the dark barrier that nature imposed upon her and found within herself light, music and the power to conceive of all that the normal person knows by the ordinary evidence of the senses. She writes:

"When I learned from Berkeley that your eyes receive an inverted image of things which your brain unconsciously corrects, I began to suspect that the eye is not a very reliable instrument after all, and I felt as one who had been restored to equality with others, glad, not because the senses avail them so little, but because in God's eternal world, mind and spirit avail so much."

Nothing can be finer under the circumstances than this assertion, made so simply and with such an air of personal conviction. In fact, one of the remarkable features of this essay is the experimental note in it, as if the writer had tested intimately every high doctrine she holds. Her philosophy is not the expression by rote of a person who has been well taught, but it is wisdom she has learned

of her own volition and fitted to the bright heart of her darkness, a sort of psychic illuminating of her own mind. And in her vision of things there is no blindness, in her reception of truth no evidence of prejudiced deafness, and in the eloquence of her optimism no hint of dumbness. She has within the effulgence of a noble faith, and every sentence of this essay leaps upon the page instinct with the grace and life of a splendid energy. Nor is the symmetry of the whole marred by the expected note of sentimentality. The form of her thought is scriptural in its simplicity, and back of all we catch glimpses of the seeing, listening, speaking spirit of this brave "blind spinner in the sun."

The Boss. By Alfred Henry Lewis. New York: A. S. Barnes & Co., \$1.50.

Mr. Lewis is indomitable. The criticisms heaped upon his preposterous "Richard Croker" have not prevented him from essaying the same subject in autobiographical form in "The Boss." This work is a thinly disguised account of the life of Mr. Croker. Tho it gives glimpses of some of the underlying methods of New York City politics and of the means by which a ward bruiser can become "boss" of Tammany Hall, and incidentally of New York City, it utterly lacks logical perception and treatment. Mr. Lewis, in common with some other fiction writers on politics, is evidently bent upon making a much-abused hero of the "boss," and of portraying civic reformers as a hypocritical class, ever ready to turn politics to their own profit. There are fake reformers and sincere reformers, but of the distinction between them Mr. Lewis seems to have no glimmering. "He holds," says the publishers' advertisement, "that the citizens get what they deserve." In the same breath that he enunciates this dictum Mr. Lewis shows that various important elections were won by Tammany by sweeping frauds at the ballot-box. These successes plainly represented not what the majority of citizens wanted, but the determination of a minority backed by fraud. Mr. Lewis, however, is so habitually prone to oracular statements that, lost in a profusion of words, he often does not stop to reconcile sheer contradictions. "The Boss"

is worth reading, only in so far as it depicts some of those tortuous, underhand ways of politics which are not open to superficial observation. But this information is available in other works which have the advantage of being maturely thought out and well written.

Red Head. By John Uri Lloyd. New York: Dodd, Mead & Co., \$1.60.

This story is like a shaft of light down a gloomy gorge—it reveals some beautiful things, but more that are wild and

PROFESSOR JOHN URI LLOYD
Author of "Red Head"

stern. Through it one gets a glimpse into the red vendetta heart of the Kentucky mountaineer—his savage hates, his sinister silence and uncouth speech, his Red Indian patience in the pursuit of a vindictive purpose, his personal independence, his sensitiveness to the claims of family and clan, his superstitions, his ignorance and some of his grim primitive virtues. From the standpoint of form this study is crude, but from the known conditions in Breathitt County we infer that it is probably true to the essential facts of the life it pictures. Broad margins on each page are lavishly decorated by Reginald B. Birch, and there appear several excellent full-page illustrations by the same artist.

Antisemitism: Its History and Causes. By Bernard Lazare. New York: International Library Publishing Co., \$2.00.

This book deals with the origin and development of anti-Judaism and incidentally refers much of the history of Israel to this sentiment. One great cause of antisemitism the author finds in Jewish commercialism. Other causes exist in the exclusiveness, the persistent patriotism and pride of Israel. Jewish influences, in spite of race prejudices and antisemitism have been powerful in the councils of nations. Even Napoleon lent an ear to them, and suspended during one year judicial decisions in behalf of the Jewish usurers of the Rhine provinces. The modern aspects of antisemitism are carefully considered by the author. The instinctive, the legal, the Christian, the Christian-socialist, the metaphysical, as well as the ethnological and national phases are successively taken up. In chapter IX the causes of antisemitism are set down, and there and in subsequent chapters make excellent reading. In conclusion the author forecasts the ruin of antisemitism because it carries in itself the germ of destruction. In preparing the way for Socialism and Communism it is laboring at the elimination not only of the economic cause, but also of the religious and ethnic causes to which it owes its own growth.

Henry Ward Beecher. By Lyman Abbott. Boston: Houghton, Mifflin & Co., \$1.75 net.

Lyman Abbott was the disciple and friend of Mr. Beecher; he was associated with him in the editorship of the *Christian Union*, and was his successor as pastor of Plymouth Church. No man could more properly eulogize this great preacher or apologize for him. Beyond doubt Mr. Beecher is the greatest figure in the American pulpit since Jonathan Edwards—much less of a reasoner, and considerably more of a poet. He had an extraordinary intuition for right, and no respect for old authority. His influence in religion, in politics and in social thought has been greater than that of any other man. It is not strange that with his immense ability, affectionateness, eloquence, courage and insight he gained an inconceivable sway over the

people, and that he was idolized by the nation where he was not hated as the enemy of dying orthodoxies and social oppressions. All this Dr. Abbott has told with all sympathetic admiration. It is the life of a great hero, somewhat more radical as to the rights of man than Dr. Abbott has come to be in the autumn of his years, but glorious in life and glorified in death. The biographer does not pass over the shadow which clouded Mr. Beecher's later life and would have blasted the life of a less transcendent genius. In that episode Dr. Abbott was Mr. Beecher's special adviser, advocate and partisan, as his brother was Mr. Beecher's legal counsel. It is from such a point of view that the story is told, just what those who loved and honored the great preacher wished to believe and to have others believe, but not what was believed by Mr. Beecher's oldest friends in the pulpit, who read the testimony which enriched the English language and befouled the popular thought and speech. We are obliged in justice to the truth to say this much by way of exception to our praise of a book of high purpose and fine execution.

History of Socialism in the United States. By Morris Hillquit. New York: Funk & Wagnalls Co., \$1.50 net.

Mr. Hillquit has furnished a greatly needed volume on Socialist history. Noyes's and Nordhoff's works relate to a period when the word Socialism meant something very different from its present meaning, while Professor Ely's "Labor Movement in America" (1886) has to do with only one phase of the movement, and Sotheran's "Horace Greeley and Other Pioneers of American Socialism" (1892) gives only fragmentary and unrelated data on the subject. It has remained for Mr. Hillquit to draw together the divergent lines and to connect the community movement of the Owenite and Fourierist periods with the radical labor movement of more recent times into a coherent narrative. As a narrative, it is well done. There are, it is true, a number of omissions and of errors of statement—tho this is a thing unavoidable, perhaps, in pioneer work on any subject requiring research. The statement on page 60 that the Workingmen's party

(1829-1830) "was the last manifestation in the labor movement of this country directly attributable to the influence of Owenism" leaves out of consideration altogether the far more important working-class movement of 1834-1838, which was merely a revival of the older one. It is an error, moreover, to speak of Ralph Waldo Emerson as having been in any way "identified" with the Fourierist movement, and an almost equally emphatic disclaimer can be made for Nathaniel Hawthorne. One looks in vain for a mention of Byllesby and Skidmore, authors of two remarkable Socialist books published in 1826 and 1829, respectively. Defects such as these aside, the book is highly praiseworthy. Its greater value will lie in its record of more recent events. In these the author has himself borne a part, and he thus writes from first-hand knowledge. Tho a partisan in one of the factions, his record is truthful and unbiased.

Hesper. By Hamlin Garland. New York Harper & Bros., \$1.50.

There was a time when the women in Hamlin Garland's novels not only "fell in love," but they invariably proposed to the cold featured, self-contained hero of their affections, and they did with sufficient reality of feeling to fascinate the reader's startled attention. But now Mr. Garland has reformed, reformed so completely that in this story the girl assumes the icy statue pose, while the men available do a green corn dance about her; and altho we admit the propriety of this change in the author's romantic tactics, we regret it. So few writers of fiction know how to represent a really nice girl making all the love and advances to the inevitable man that we had come to cherish Mr. Garland particularly for his versatility in this line. However, the love strain is never the chief thing in his Western novels. For they are not stories of life so much as they are albums of natural scenery. No one since Bret Harte is able to show nature so well in her mountain moods. The mining life of the camps, the feeling and point of view taken by all the characters in the book result evidently from the altitude, oxygen and snow capped sternness of the situation. *Hesper* is a thrilling romance,

a vigorous work of literary art worthy of the author's reputation.

The Heart of Rome. By F. Marion Crawford. New York: The Macmillan Co.

Mr. Crawford is essentially within his own bailiwick when he writes of Italy, his birthplace and the land in which the greater share of his time is spent. That he knows his Rome through and through, from the Wall of Aurelian to that of Ur-

F. MARION CRAWFORD
Author of "The Heart of Rome"

ban the Eighth, goes without saying, and his acquaintance with the ways and means of clever story writing is hardly less intimate and inclusive. These two particular branches of his knowledge are very ably combined in the present novel—subtitled "A Tale of the Lost Water," and, one may mention parenthetically, of a lost treasure as well—which proves as stirring and dramatic a romance as any he has written.

Michael Angelo Buonarroti. By Lord Ronald Sutherland Gower, F.S.A. New York: The Macmillan Co., \$1.75.

The author of this new life of Michael Angelo is fully aware of adding anything really new to what has already been written about this great Florentine, and calls his monograph simply "a tribute of

homage." Unfortunately we cannot say that this homage is always discriminating. For example, in criticising Michael Angelo's tremendous figure of unrest, called "Day," on the tomb of Julius De Medici, Lord Gower says it "has all the supreme repose and god-like calm of the so-called Theseus on the pediment of the Parthenon." The comparison is anything but apt. The author has, however, made a valuable contribution to art criticism in giving to the public a letter from the veteran artist Watts, which is so remarkable and yet, we feel, so just, as to merit fuller quotation than our space allows. Watts thinks he may be a minority of one when he writes:

"The paintings in the Sistine Chapel are, to my mind, entirely beyond criticism or praise, not merely with reference to design and execution, but also for color, right, noble and perfect in their place. I was never more surprised than by this quality, to which I do not think justice has ever been done; nothing in his sculpture comes near to the perfection of his 'Adam' or the majesty of the 'Dividing the Light from Darkness.' . . . The Prophets and Sibyls are the greatest things ever painted."

It was generous in Lord Gower to publish this letter, as he does not agree with Watts in his estimate of Michael Angelo as a painter. Of the "Dividing the Light from Darkness," his own opinion is thus expressed: "It is an unpaintable subject, which even the genius of a Buonarroti was inadequate to portray."

The Alphabet of Rhetoric. By Rossiter Johnson. New York: D. Appleton & Co., \$1.25 net.

This little volume, modestly offered by the author in his preface as a "reminder"—"not as an authority"—should be welcome not alone in scholastic circles, but among the "common people." In it Dr. Johnson enters upon a new field, but, as might have been expected, the book is so entertainingly written as to make really delightful reading. It is calculated to awaken an interest in the history of language and its use as exemplified by our best authors and speakers. Common errors of speech are pointed out, correct and elegant expressions suggested, and many quotations from both prose and poetry are offered

in illustration. A concise and clear exposition of the various figures of rhetoric is given. The closing chapters on elocution will be of advantage not only to the professional elocutionist but also to the amiable member of the family who reads aloud for the pleasure of the home circle.

Schumann. By Annie W. Patterson. [The Master Musician Series.] New York: E. P. Dutton & Co., \$1.25.

Pending an authoritative and exhaustive Life of Schumann, which has still to be written, the little volume by Miss Patterson gives a useful account of the composer and his works. Her attempt at criticism is but slight, but she judiciously refers the reader to the best sources for that. The book contains little that is new or original, but conveniently summarizes previously scattered material. It touches comprehensively enough on the various aspects of Schumann's career as composer, conductor, musician, critic and writer, not neglecting to emphasize the value of his work in being the first to encourage and advance contemporary composers. Indeed, as a model for critics Schumann can hardly be too greatly extolled; his musicianship gave him real understanding of what he was criticising without spoiling his open-mindedness and he had besides the gift of writing graphically and intelligently—rare among musicians. While Chopin was yet unknown, Schumann bravely writes: "I bow before Chopin's spontaneous genius, his lofty aims, his mastership;" and he hailed Brahms as "an apostle who should reveal many things which the Pharisees would be unable to comprehend for centuries." Nor was it mere facile good nature that dripped from his pen, but genuine conviction that drove it, as his severity on occasion proves, the conspicuous example being Meyerbeer. And for Wagner he was never able to care. When conductor at Düsseldorf he expressly arranged with the directors that one concert every year should be devoted to the works of living composers. The shadows of the picture come in what the author tells us of Schumann's morbid sensitiveness. His reserve and timidity made him pathetically unsuccessful as a conductor, and deepened at last into the tragic insanity of his latter days.

Literary Notes

HOUSEKEEPERS in search of novelties in the way of "Christmas goodies" will find receipts for a variety of these in *Harper's Cook Book Encyclopædia*.

....Edwin Markham has written an introduction to a collection of poems by Miss Alice Jennings, entitled *The Fruit of the Spirit*. (Revell Company.)

....A very ingenious "juvenile" is *The Life of a Wooden Doll* (Fox, Duffield & Co.). Photography has been used very effectively in providing illustrations for the volume.

....The A. Wessels Company announces a reissue of Thackeray's charming and characteristic sketch, *Reading a Poem*, which originally appeared under the title of "Loose Sketches" in 1841. The edition will be limited to 200 numbered copies.

....Goethe's *Das Märchen*, with introduction, notes, vocabulary and conversational exercises by Prof. C. A. Eggert, is announced for publication by D. C. Heath & Co., of Boston. The book is well adapted for elementary classes in college and for pupils in intermediate schools.

....An excellent volume is that published by Rand, McNally & Co., and entitled "A First Book in Business Methods." It tells one how to write business letters, how to make out bills, invoices, statements and receipts, how to deposit money in banks and how to draw the same, and contains a lot of other very useful matter in the field which it surveys.

....*The History of American Sculpture* (Macmillan Company) is to be followed by Mr. Louis C. Elson's *History of American Music*. After that will come Mr. Samuel Isham's volume, *The History of American Painting*. Mr. Joseph Pennell is writing the volume on *The History of American Etching, Engraving and Illustration*.

....The New York Times Saturday Review of Books and Art, which is an excellent authority, has spoken favorably of *Elsieville*, a Parable of Church Unity, by Charles B. Holmes. It is confessedly a novel with a purpose woven into a moral story in which the mountains, brooks and woods are incidental. The book is published by the author.

....Percy Bysshe Shelley, An Appreciation by Thomas R. Slicer, issued by Charles P. Everitt, is a very charming example of typography. The book has beautifully wide margins and the deckle edged hand-made paper so dear to the hearts of bibliophiles. The edition is limited to 150 copies. The illustrations show a number of reproductions of original Shelley title pages.

....Eight hundred birds in color appear in Frank M. Chapman's new *Color Key to Birds*. The book is a kind of dictionary, with the color characteristics so plainly marked that one can hardly mistake the bird, even tho it be but one among a thousand. Doubleday, Page & Co. were somewhat delayed with the publication of the book, because the colors required considerable perfecting. This work was done under the personal direction of Mr. Chapman, and the book as now available is most excellent.

Pebbles

She: "Yes, I just love dogs!" *He*: "Then I'd like to be a dog." *She*: "Never mind; you'll grow."—*Harvard Lampoon*.

....At the gait we are going that canal should be finished by the end of next week.—*The Houston Post*.

....English Professor: "How long did Richard II reign?" 1907: "Until he was decomposed."—*Yale Record*.

....It is preposterous for the Moros of Jolo to want to set up a government of their own, as they have no canal to sell.—*The Chicago News*.

....*Professor*: "What would you call a body holding within itself another body of smaller size, but of similar shape?" '07: "A peanut, sir."—*Harvard Lampoon*.

....*Larry*: "I sent Maud a garter snake in alcohol for a joke." *Harry*: "What did she do?" *Larry*: "Oh, she returned it in the same spirit in which it was sent."—*Princeton Tiger*.

....*Jack*: "You've heard about the escaping criminal who stepped on a slot machine and got a weigh?" *Mack*: "Yes, that's old." *Jack*: "Well, even the bloodhounds couldn't get his cent."—*Yale Record*.

...."Stop!" she cried, when he attempted to kiss her. "You must!" The youth, being unaccustomed to that sort of thing, drew back abashed. "Stop!" she repeated, noticing his timidity; "you mussed—my hair." Then he resumed, but more carefully.—*Catholic Standard and Times*.

A TRAGIC CALENDAR.

Jan-et was quite ill one day;
Feb-rile troubles came her way.
Mar-tyrlike she lay in bed;
Apr-oned nurses softly sped.
"May-be," said the leech, judicial,
"Jun-ket would be beneficial."
Jul-eps, too, tho freely tried,
Aug-ured ill, for Janet died.
Sep-ulchre was sadly made,
Oct-aves pealed and prayers were said.
Nov-ices with many a tear
Dec-olated Janet's bier. —*Life*.

Editorials

A Christian Holy Day

WHATEVER may be said of our spiritual aspirations and religious qualifications, the human nature we have is so pagan, so secular in its manifestations that when a holy day, like Christmas, has withstood the wear and tear of our perverse moods for nearly twenty centuries, it loses some of its original sanctity. We have indeed created a season of solemn joy which we are not correctly disciplined to observe. Only the little children among us have the proper spirit and faith with which to meet the occasion. Our faculties have become merely earthwise, and we have been in the wine press too long. There is a bacchanalian note in our Christmas carols, too much of an egg-nog ending to our prayers of thanksgiving. The stars that shine upon the festive red of the evening do not lead out through the sacred silence of scriptural memories toward the Kingdom of peace and good will. Many of us are losing our way, wandering further from the shepherded hills of God, where in the wide stillness of the star-lit night a wise man, if his ear is rightly tuned, may yet hear the heralding angels sing.

But that is the trouble,—we are losing our “wise men.” Too many of them have abandoned the journey of faith and love, that ended in offerings and worship, because they have discovered that the Star of Bethlehem is a little vagrant comet or lucky conjunction of planets, and now all their energies are engaged to compute their orbits. Meanwhile many, still of the pastoral mind, who needed the heavenly illusion to guide them across the mountains and through the wilderness of this world, are left alone in the darkness. They are like sheep gone astray. They praise God, but they do not know him. They have their offerings of frankincense and myrrh, but they cannot find their Bethlehem. They are stupid, to be sure, for allowing the revelations of science to confound them. But then

the “wise men” are also stupid, in that they do not comprehend the significance of this spiritual orphanage of their race. High upon the ledge of things, emancipated from superstition, and superior to psychic suggestions, they are weighing the dust of this earth in their hands, measuring the star-lit angles of heaven, and testing the foundations of the universe with the ciphering rod of their imagination,—all of which is right, very wise and useful from the experimental point of view. But where is God? Not the great God of the philosophers and scientists, but the Father God of the simple minded? These can never learn much, but they need God the more on that account. Indeed, most of us need him more than we could profit merely by knowing the distance which separates us from the heavenly bodies above us. What if we do manage to find our way through parables and figures of speech and the glory of ordinary comet-tails to the mind of God? The main thing is to arrive. It does not matter whether the Star of Bethlehem was a combustible body of illuminating gases or a diadem flung from the crown of heaven to shine for the wizards a holy path across the world. The end served was sanctifying. And admitting all the scholars have been able to discover, there is something else of which this star was a shining symbol, something in us that answers to the esoteric meaning of Old Testament tales. The wise men who forget this are even less than sounding brass and tinkling cymbals. They are vitalized lumps of matter, who secrete thoughts indeed, but who cannot rise above the dirt level of their own graves in hopes or consciousness.

But whatever may be said of the wise men, there is no deflection in the children. In the short span of a man's years he cannot wander far astray; meanwhile, every child that is born begins life with all the faith there is. These are the invincible little saints whom we shall always have with us to

follow if we can. They have prophecy and scripture on their side, and all of heaven about them in consciousness. Because their hearts are good, they believe even more than we doubt, and there is the deepest philosophy in their position on this matter. Thus, the confidence they have in Santa Claus is their strongest appeal. It creates a demand which we are constrained to supply. And for one hour each year, therefore, the old, skeptical grown-up world under the guise of a merry old Saint pays an involuntary tribute to the eternal faith of childhood.

And now when so many elder people are ready to profane the holy season with unholy mirth, these little ones are purifying themselves that they may be worthy of the good Santa. It is a short termed piety, to be sure, but it is guilelessly based upon all the virtues they have. And their pharisaism is so innocently mercenary that not even the guardian angels are ashamed of it. May each hypocritical little stocking be filled to the fat top with sacred sweets. No other sinners in this world are so deserving of heaven's favors! Above all, may their elders profit by the refreshing example they set of faith and of joy in its fulfilment.

Assistant Secretary Loomis's Warnings

SOME of the Senators are angry at Assistant Secretary Loomis's address before the Quill Club in New York last week. He told them things, they say, which the President had not told the Senate.

Not exactly. His speech had two fresh points, and might have had more. Both of them were in the nature of warnings, one to the people of this country and the other to the persistent revolutionists in Latin America—not to Mexico, Chile, Argentina and Brazil, but to the little countries whose principal industry is revolutions, as President Roosevelt has shown in the case of Colombia, and as we know it to be in the case of Santo Domingo, which is having a revolution every month or two.

The warning to our people is as to the danger which would have come to us if we had not recognized the independence

of Panama, and which may yet come if the treaty with the new State is not ratified. It ought to have been clear to everybody, and must have been clear to the State Department, whose business it is to foresee eventualities. If we had let things drift, as Senators Morgan and Gorman would have had us do, Colombia would next year have declared the Panama concession forfeited, and claimed possession of all the property and rights of the French Canal Company. What, asks Mr. Loomis, would have followed? Would the French, who have put hundreds of millions into the project, who possess values there for which we offer them forty million dollars, have stood still and quietly seen their property confiscated? We may be sure not. A French fleet would have taken possession of the canal and of the Isthmus, and how long would it have taken to dislodge them, despite the Monroe Doctrine? No one can tell; but this we know, that it would have produced a most unhappy and dangerous complication. There has been trouble enough lately over a very much less important difference about Venezuela, where British and German fleets proceeded to enforce their claims. By recognizing the independence of Panama we have forestalled and escaped that danger.

But why did not the President tell that to Congress in giving the facts as to our recognition of the new Isthmian republic? Simply because there was no information to give. There was no diplomatic correspondence on this subject. The thing had not happened. We did not allow it to happen. But it was one of the contingencies that we had to have in mind, and did not need to say anything about, and which were as open for knowledge to Senator Gorman and Senator Morgan as they were to Secretary Hay. It is the business of a diplomatist to look ahead.

The other warning was directed to the chronic revolutionist nations. By this time they ought to have learned the lesson of peace. They embroil themselves and embroil the peaceable nations about them. Colombia and Venezuela are among the worst of them. Heaven knows we do not want to possess their territory. We have no desire to extend our possessions into South America. But it is true, as Mr. Loomis said, that "cer-

tain people are in sore need of instruction in the practice of peaceful pursuits and orderly administration." They disturb the interchange of trade, and they invite forcible intervention of European Powers, and compel us to protect them. The United States is in a measure responsible for their good order, and it looks sadly as if we might be compelled to stand sponsors for them further and accept the duties of instruction that belong to sponsors. Minister Powell has lately told the authorities of the day in Santo Domingo that continued political disturbances might bring about unwelcome action by the United States. Here we see the evil result to us and to the people of that little republic, so called, of the failure of the Senate to approve the foresighted action of President Grant as to that island. It is now reported that the Venezuelan Government may not carry out its pledges to pay European creditors, and Mr. Loomis's remarks might well be heeded at Caracas. The statement that the President has congratulated Mr. Loomis on his address may show that when he uttered his warnings he spoke for the Administration. His address was timely and his warnings should be heeded.

Wages or What?

THE interest that was awakened by the Hon. Carroll D. Wright's recent addresses before the Ethical Culture Society at Philadelphia, and before the People's Institute at Cooper Union in this city, is significant of a common feeling that the wages system is inherently too defective to be accepted as a permanent relation between capital and labor. Dr. Wright expressed a belief that some plan of profit-sharing or co-operation must ultimately supersede wage payments. His belief may be well founded, and the popular feeling that the wage system can never be made quite satisfactory may be justified by fact. Yet there are some things to be said on the further evolution of the existing industrial order that are worth thinking about.

In Great Britain productive co-operation by workingmen has succeeded reasonably well, and each year shows an increasing number of prosperous co-operative enterprises. In many countries

profit-sharing plans have been tried, but they have nowhere been so conspicuously successful as to threaten rivalry with the simpler plan of wage payments. In many instances workingmen have complained of them as tending, on the whole, to diminish the remuneration of labor while increasing the employer's exactions. In the United States especially there is a general distrust of both co-operation and profit-sharing on the part of the great body of wage earners. It must be confessed that there is little in the existing situation to justify expectation of any radical departure from the wages system.

It may be remembered that in the concluding volume of his "Principles of Sociology" Mr. Spencer put forth a destructive criticism of the wages system, as an arrangement that perpetuates many essential features of serfdom. While the workingman is free to make his own wage contract, yet during the hours of his service he is not his own master, as the business man or the professional man is. Mr. Spencer suggested a simple and ingenious development of the co-operative principle, which was described in detail in our columns at the time. Essentially it consisted in a combination of the piece-price mode of payment with co-operation. Workingmen usually object to the piece-price system because they claim that it fixes remuneration by the utmost achievement of the most dexterous hands. This objections would not hold in the plan outlined by Mr. Spencer, where the co-operators would share profits in proportion to their industrial accomplishment.

The plan is entirely practicable wherever co-operation itself is feasible. Nevertheless, there are other ways of achieving the results that Mr. Spencer sought and those that Dr. Wright looks forward to, that seem just now more likely to secure a thorough trial. Through the power of their unions, and through legislation, workingmen are to a great extent fixing the conditions under which they work. If the experience of the building contractors, for example, is an indication of what industrial relations are coming to, employers are no longer to lay down rules governing the conduct of their employees, but are themselves to obey orders imposed by unions and

enforced by walking delegates. It is highly improbable that any scheme of industrial partnership could give to the great body of wage earners as much power to determine hours of work, to choose their associates and to prevent discriminations in remuneration as they now enjoy. It is even doubtful if as partners or stockholders they would have as much influence upon the market as they now exert through the strike and the boycott,—actual and potential.

The real object to be secured by any workable substitute for the wages system, then, would seem to be industrial peace rather than proletarian control of the conditions under which labor is performed. The existing order, it must be confessed, borders closely on chronic industrial war. We concur in the view of those who hold that a general ownership of industrial shares in small lots by workingmen—not as a rule the shares of the particular enterprise for which the wage earner is working, but rather those of enterprises for which his fellows are working—would have a conservative and pacifying effect. Such widespread ownership is impossible now solely because it is unsafe from the point of view of investment. And it is unsafe chiefly because of stock market manipulations. The popular instinct that attributes a large measure of responsibility for economic ills, including the quarrels between labor and capital, to unscrupulous stock-jobbing is not unsound. We suspect that if market quotations of industrial shares represented actual values, fixed by honest transactions, “labor difficulties” would smooth out amazingly.

Life in Modern Biology

NOTHING is more interesting in modern biology than the universal acknowledgment at the present time of the utter mysteriousness of what may be called, for want of a better term, vital force, and of its origin and influence. The recent death of Herbert Spencer serves in biological circles mainly to recall the fact that toward the end of his life the distinguished philosopher, who had influenced the thinking of several generations, not only of his fellow countrymen, but of foreigners, more than any other

of our time, had apparently modified his views as to the significance of life. While in his “Principles of Psychology,” written nearly fifty years ago, when he was about thirty-five, he said:

“the chasm between the inorganic and the organic is being filled up; the microscope has traced down organisms to simpler and simpler forms, until, in the protogenes of Professor Haeckel, there has been reached a type distinguishable from a fragment of albumen only by its finely granulated character,”

within the last five years he completely altered this statement. In a letter published in *Nature* (London, October 20th, 1898), Mr. Spencer said:

“In my revised ‘Principles of Biology,’ I have contended that the theory of a vital principle fails and that a physico-chemical theory of life also fails; the corollary being that in its ultimate nature life is incomprehensible.”

In thus acknowledging the mystery of life, Mr. Spencer was only placing himself in the ranks of those great scientists who have in the last decade confessed that Materialism is quite unproved. Recently Lord Kelvin has told of his asking Liebig, the great German chemist, many years ago, if he thought it possible that a flower which he had picked up in their walk could have come into existence by chance. Liebig’s reply was that he would as soon believe that the flower had come into existence by chance as that a book on botany describing it could have come into being by chance. Not long since Lord Kelvin himself declared with considerable warmth that science does and must positively affirm creative power, since biology makes every one feel the miracle of life in himself. And then he added: “Every action of the human free will is a miracle to physical and chemical and mathematical science.” This recalls forcibly Professor Minot, of Harvard, opening a session of the American Association for the Advancement of Science with a paper on consciousness as a factor in biology and declaring that science knows force and consciousness in the world much better than it does matter, since we know this latter only through dynamic manifestations or its appeal to consciousness.

As we pointed out editorially last year about this time, a great change has come with regard to the supposed conflict be-

tween orthodox thinking and science. A quarter of a century ago Tyndall said that he discerned in matter the promise and potency of all things. Huxley, in the "Lay Sermons," was certainly making converts to Materialism rather than to anything like the more spiritual agnosticism which has become familiar in our day. Romanes was writing his "Candid Examination of Theism" to prove that Theism must be given up. Haeckel, at the famous Munich meeting of the naturalists of Germany in 1877, was insisting on the necessity for teaching rank Materialism in the schools; and when the great Virchow opposed it, the latter was considered by many even seriously thoughtful scientists as entirely too reactionary in his conservatism. All this has changed now, and it has become quite the fashion not only to recognize the insolubility of the problem of life, but even to confess that while we know little of matter it is the exhibition in matter of force that gives us whatever knowledge we have, and that we must confine ourselves to the study of this rather than to the underlying material basis of which we all know so little.

With all this in mind it is perhaps not so surprising to read the recent declaration of one of the most distinguished of the English electrical scientists, Mr. Oliver Lodge. Aroused by the recent observations that at last seemed to point out definitely the practical possibility of the transmutation of elements into one another, he has come to look upon matter in quite a different way from before. Professor Lodge has stated the following rather startling speculation as to the constitution of matter:

"There are those who have surmised that matter is, after all, only the weapon and vehicle of mind. The way it interprets itself to our consciousness through the sense of the organs gives no clue to its nature. A motion and alteration of the configuration of the molecules of our brain are believed to accompany every act of thought. It will be, at any rate, a suggestive analogy if a material process of an essentially similar sort is found to be occurring throughout what we know as the inorganic worlds—the world of dead matter—and we should begin to ask, Does all this motion correspond to some universal thought or mental activity likewise?"

Verily this is a long way from the Ma-

terialism of fifty years ago. In this tendency of modern thought to revert to forms similar to those of the older Pantheists there is some danger that the pendulum will swing too far this way, as it has in the opposite direction. We must not lose sight of the necessity of substantiation by scientific investigation and illustration by faithful practical observation.

Peonage in Georgia

THE late Robert Toombs, in 1886, said in an interview in the *Atlanta Constitution* that the negroes in the South still occupied essentially the position of slaves. When asked what would be the ultimate condition of the negro in the South, he replied:

"Peonage."

"As it exists in Mexico?" asked the interviewer.

"Something very similar," said Mr. Toombs. "Of course, the negro will remain theoretically a free man, but it is necessary for his preservation that he should be a servant and have a master to call the relation by whatever name you will."

To be sure, Robert Toombs was not the father of the peonage system, but it is certain that for many years now this infamous "graft" has been in vogue in different sections of the South. About four years ago public attention was first called to its existence by exposures of conditions in the neighborhood of Anderson, S. C. More recently, Judge Jones, of Alabama, a Gold Democrat, appointed by President Roosevelt, has won just fame by punishing two or three white men who were guilty of this offense in that State. And, more lately Judge Emory Speer, of Georgia, has been winning. At Savannah, Ga., on Monday November 23d, twenty-six indictments were returned by the Federal Grand Jury against seven prominent white citizens of South Georgia. Three of those indicted bear the name of McCree, of Valdosta. The indictments were for various offenses connected with the alleged selling of negroes into peonage and other modes of depriving them of their liberties. Edward J. McCree entered a plea of guilty to thirteen charges of peonage, and was sentenced by Judge Speer to pay a fine

of \$1,000 on one case, and the other cases against him were allowed to rest during good behavior.

Now this Mr. McCree is a member of the Georgia Legislature, and is said to be the owner of some 37,000 acres of land in South Georgia, from which he has amassed wealth by convict labor. In Georgia there has existed for many years a vicious system by which persons convicted of crime may be turned over to private "parties," who would pay their fines and the costs of court. Under this pernicious law for years and years people have been taken to these "convict camps" under the most flimsy pretexts and kept there in a state of slavery, guarded by day and locked up by night. In some cases poor and ignorant negroes have found their way into these camps without being committed by any process of law; they have simply been captured and kept in bondage. It was this system which the McCrees took advantage of, and made themselves rich by such unpaid labor.

On all sides the question is now being asked in Georgia, what effect will this punishment of Edward McCree have upon his seat in the Legislature, and already most of the State papers are saying, "None whatever." The Georgia law provides that a man who has been convicted of felony cannot hold office or vote, and a crime punishable by imprisonment in the penitentiary is deemed a felony. McCree could have been sentenced to a Federal penitentiary for a grand total of sixty-five years and could have been sentenced to pay fines aggregating \$65,000. But peonage is not a felony under the Federal law. Query: Having been tried under a United States law for a crime which is not a felony, altho he could have been punished by imprisonment in a Federal penitentiary, and the Georgia law declares any crime punishable by imprisonment in the penitentiary to be a felony—Is Edward McCree a felon? Most Georgia papers say he is not, and so he is likely to keep his seat in the State Legislature.

But this is not the only complication. Under the present Georgia law the misdemeanor convicts shall be leased to the highest bidders. Edward McCree put in a bid for a hundred convicts, and they have been awarded to him. The con-

tracts have been signed and the bond given. Query: Will Edward McCree's plea of guilty have any effect upon this contract? Most Georgia papers say that it will not.

In *The Augusta Chronicle* of November 27th is a statement of Assistant District Attorney Akerman, who prosecuted the cases at Savannah for the Government, which will serve to illustrate the methods used by the convict lessees, who have heretofore carried on their negotiations directly with the sheriffs and judges of minor courts. One remarkable case was that of Lula Frazier. The woman was arrested and placed in jail for an alleged violation of the law. She never was tried, but the McCrees paid fifty dollars and she was turned over to them and worked seven months. Ex-Sheriff Thomas McClelland and the woman's lawyer, William F. Cauley, are under indictment for their connection with this case. Another interesting case was that of two little negro boys named Henry Brimmage and Dave Smith, who were charged with stealing a watermelon. The judge of the court refused to fine them, saying some one else would pay it and the boys would not really suffer, so he sentenced them to a month in the Ware County chain gang. The next day Ed McCree paid the sheriff twenty-five dollars, paid the lawyer for the boys forty dollars and took the boys to his camp, where he kept them seven months. The check was made payable to the sheriff. Altho the boys served seven months instead of thirty days, the sentence of the court is still hanging over them, as they have never worked on the Ware County chain gang. Another case was that of a negro girl who was passing through Valdosta on her way to Florida. Her train was delayed and she remained over all night, stopping at the home of a negro doctor who kept a drug store. He made a charge against her the next day and offered to compromise the matter on payment of \$25. He turned her over to the McCree camp and was paid \$20. She was kept there from the 4th of September until the 26th of December of last year, when her mother located her and obtained her release on payment of fifteen dollars. These cases will serve to illustrate the workings of a system which is in some respects a worse disgrace than

lynching, because it is created and protected by law.

The Settlement of the Friar Question

THE settlement of the long dispute over the Philippine friars and their lands is a good piece of news. We know of nobody that has a right to complain of it, except certain Catholic journalists, we are tempted to say the most blear-eyed of the profession, who will lose their principal topic for the abuse of the United States Government. The Pope says he could not have had a better Christmas present, and the statesmen in that Church, here and in Rome, have long been hoping, in harmony with Governor Taft and President Roosevelt, for this conclusion. It is a great blessing to the Catholic Church in the Philippines that the immense possessions of the Friars will now be broken up into small holdings, and the Friars will no longer be objects of political or agrarian hatred.

St. Benedict, founder of the monastic order that bears his name, just before his death in a monastery at Bologna in the year 1221, pronounced a curse on any one who should venture to endow the order so as to secure to it revenues instead of depending on the gifts necessary to preserve the life of those who were sworn to poverty. That curse has worked.

Twenty-four years later the rule forbidding endowment was revoked. There were still those who held to the primitive rule and were called Rigorists, but they were in a minority, and before long were formally condemned. Then speedily followed excesses. It was not allowed to the friars to have property of their own, but the monasteries could possess any amount of wealth; and it is this perversion of the rule of Benedict, and a similar rule of St. Francis, that corrupted the orders until they were a scandal to the people. One need only read the literature of the centuries preceding the Reformation to see the contempt in which the orders had fallen. Not to go outside of English poetry in the next century, only Chaucer's milder language is quot-

able; the rougher could not now be listened to by ears polite. His monks and friars could not endure

"The reule of seint Maure and of seint Beneit,
By-cause that it was old and som-del streit."

Thus he describes one of these friars, "a wantown and a merye:"

"Ful swetely herde he confessioun,
And pleasaunt was his absolucioun;
He was an esy man to yeve penaunce
Ther as he was to han a good pitaunce;
For unto a povre order for to yive
Is signe that a man is evel y-shrive . . .
Therfore in stede of weping and preyeres,
Men moot yeve silver to the povre freres."

And the curse continued to work. With the Reformation a multitude of monasteries were confiscated, and even libraries were dispersed in the ruin. The Catholic countries equally with the Protestant have despoiled the rich orders. The Latin-American republics have been guilty of much of this "sacrilage," and now we see the French Republic repeating the crime in its hostility to the wealthy orders. Had the Dominicans and Franciscans remained true to the rule of poverty, they might have held the hearts of the Filipinos. As it was, they were greedy of wealth and were the real rulers of the islands. Individually, they had no property, but the households to which they belonged were very rich. They were like the wife and children of a millionaire, who holds all the wealth of the family in his own name. Now those of the friars who wish to remain can go back to their parishes in safety, for they will depend on the support of their people.

But we have not yet heard how the millions paid for their lands are to be spent. Will they go to the orders in Spain, or will they be used for the benefit of the Church in the Philippines?

The Adirondack Problem

FROM the report of the Forest Commission of 1903 it appears that nearly eight hundred thousand acres of Adirondack lands are held by about sixty owners, or by clubs for game preserves. These holdings vary in acreage from three hundred acres to seventy-nine thousand acres, in a single block. They do not prevent so much the acquiring of

homes in these mountainous regions—which are hardly intended for homes—but they curtail the public use of the forest. Professor Fernow, who advocated, in his "Economics of Forestry," the occupancy by private owners, and even the creation of a class of landed proprietors, as the only method in sight for immediately protecting the forest from devastating fires and from timber thieves, now says that he must modify his judgment to this extent, that any such occupancy tends to create a class of those who do not care for the public weal, but for private pleasure, to the exclusion of the people. He thinks that gradually, and perhaps imperceptibly, an aristocratic spirit will be developed inimical to democratic institutions. In the third place, Dr. Fernow finds that the attitude of the State toward its own holdings is changed. At first the reservation of Adirondack lands in the hands of the State was based on economic questions of timber supply and water protection, but it is now perverted into the idea of establishing a great pleasure ground. He thinks this to be present attitude of our legislators, shown in their recent action concerning the work of Cornell University.

"While there is no objection to have such a large area devoted to pleasure—if accessible to all the people, and used in a proper way—it is not necessary, and it is economically unsound, to exclude the management of these forests from economic ends."

The position of the Professor is that of honest democracy. He has advocated large forest holdings in private hands, and saw no objection to corporations controlling the timber supply, but he deprecates these vast holdings for mere pleasure. He holds it to be the first object of the State to have the great forest region as a source of revenue, involving the preservation of water and the balancing of the temperature of the State. To withdraw the Adirondacks from the productive industries he denounces as un-American.

That sixty owners, whether private individuals or clubs, should hold eight hundred thousand acres out of the reach of the people is an innovation that cannot be denounced in too strong terms. It is certain to create in this country a vulgar

edition of English landlordism, and it is a catching spirit. Sooner or later, it must breed the same sort of antagonism which exists between the tenants and poachers of Ireland and their landlords. There will be a good deal of trespassing, and there will be a growing sentiment of lawlessness, because law will be on the side of the aristocrats. The clash will involve more or less of brutality and assassination, the shooting of game wardens, and, finally, of landlords themselves. Indeed, this antagonism is already observable and has threatened life as in the old "Barnburner" days.

It was hoped that the establishment of a State College of Forestry, in connection with Cornell University, and the placing of the Adirondacks largely in its control, would solve the problem, which had long been a serious one to the State. It is to be regretted that a misunderstanding has arisen, and the State withdrawn its appropriation for this College. That this College moved on lines antagonistic to the popular welfare does not seem to be proven. Governor Hill, in 1890, said to the Legislature that he believed "the Adirondack forest might be made a source of great revenue to the State, rather than an expense and a burden." Governor Flower, in 1892, said that "eventually the State preserve ought to pay the expense of its maintenance, by the judicious sale of timber and the leasing of small parcels of land, to individuals, for the establishment of small homes, under proper regulations." He added, in 1894:

"Following the ideas and suggestions which have been promulgated by forestry experts, we intend that our forest shall not only protect our water supply, and thereby our agricultural and commercial interests, and furnish summer homes and sanitariums for the people, but that they shall, at the same time, yield a revenue which shall pay the cost of maintenance and a handsome sum besides."

Governor Black was of the same mind. He thought that the time would come when the State would sell timber to the lumbermen, spruce to the pulp mills, reap a large revenue for itself, still retain the woods open to the public,—protecting the sources of water,—and increasing the yield under intelligent cultivation. It was along this line that he

urged that this section of our State should be placed in charge of Cornell University. President Roosevelt had his first training in forestry as Governor of New York State. In 1903, in an address to foresters, he said:

"The object is not to preserve the forests simply because they are beautiful, but the primary object is the making of a prosperous home. This economic conception of the whole question we hold to be the correct one. The useful and the beautiful need never be divorced."

The College of Forestry for working out these economic conceptions, which really date back to Gov. Horatio Scymour, was, we believe, one of the wisest institutions ever created in our State. The Constitutional Convention of 1894 prohibited the cutting of wood upon the Forest Preserves. This was to turn the whole Adirondack woods into an everlasting wilderness, obliterating the economic conception of the problem. Without violating the Constitution, it was thought that Cornell University might be allowed to conduct forestry experiments on a purchase of land adjacent to the Preserve for thirty years. It was provided that the University might

"plant, cut, raise and sell timber, with a view to obtaining and imparting knowledge concerning the scientific management and use of forests, their regulation and administration, the harvesting and reproduction of wood crops and earning a revenue therefrom."

The College of Forestry was made a branch of Cornell University, and given a working capital of thirty thousand dollars. It was supposed that the sale of wood might enlarge this capital,—none of the profits accruing to the University. The working of this College brought it immediately under the condemnation of its neighbors. If the economic conception of the Adirondacks were allowed to thus work itself out there must be an end of landlordism, sooner or later. The result was a violent attack, with a good deal of misapprehension and misrepresentation, followed by a withdrawal of State patronage. The College is closed. The State of New York, through its Constitution, unwittingly made more than a million acres of the Adirondacks a permanent park for sportsmen. This

was a bid for wealthy persons to secure as large areas as possible for their private uses, and they have done it. It was impossible to judge reasonably of the College of Forestry from an experiment lasting less than three years. It was expressly organized by the Legislature for a "thirty years' test. It needs but common knowledge of forestry to understand that in less time an economic experiment of this kind could not be worked out. As matters now stand the Adirondacks are given up to private exploitation. The forest question, so far as New York is concerned, has ceased to be one of economic import, and has become one of pleasure alone. Professor Fernow, who had charge of the College, certainly has the entire confidence of experts in this country and in Europe. Prof. R. W. Raymond indorses his work in the highest terms. He was Chief of the Division of Forestry at Washington when called to be Director of our State College. Can we afford to allow matters to rest where they are? Shall we create in our country a spirit of outlawry to compete with an unwelcome development of landlordism?

John Turner
Again

We have allowed the Anarchist, John Turner, to defend himself in our columns, and we have criticised the law. But there is something to be said on the other side. It is a law not directed against the liberty of citizens, but against foreigners, limiting their right to enter this country. Doubtless we have the international right to exclude any class of people we regard as likely to be an injury to us. Who they are is a matter of judgment, good or bad. Under this right we exclude some diseased people, paupers, lunatics, men who have a job engaged, and Chinese. The law also provides:

"That no person who disbelieves in or who is opposed to all organized government, or who is a member of or affiliated with any organization entertaining and teaching such disbelief in or opposition to all organized government, or who advocates or teaches the duty, necessity, or propriety of the unlawful assaulting or killing of any officer or officers, either of specific individuals or officers generally, of the Government of the United States or any other organized government, because of his or their official

character, shall be permitted to enter the United States or any territory or place subject to the jurisdiction thereof."

This law may or may not be wise, but it is beyond question that John Turner is one of those whom it excludes. It is not a law that affects residents of this country, whether voting citizens or not. They can lawfully preach all the academic Anarchism they choose, so long as they do not advocate assassination. If there is one dram of reason for excluding an honest artisan who has a job, there is a ton of reason for excluding one who declares his desire and aim to overthrow the government under whose protection he proposes to live. The law was passed when an Anarchist fool, inflamed by Anarchist speeches, had just killed President McKinley. We have seen Anarchists come here to plot in New York and Paterson the murder of European sovereigns. The class is dangerous; the crime of Czolgoz simply expands the teachings of Emma Goldman. She did not tell Czolgoz to kill the President; she put the fire in his bones. Yet we would admit workmen with a job, and Chinese, and Anarchists who incite no murder. A President or a King may be killed, but that is a risk of the profession, and shutting out Tolstoy would not prevent our native and imported Anarchists, in far greater numbers, from talking or doing their will. The law is at most an unwise exercise of undoubted right against what are somewhat "dangerous characters" so long as they stick to theory, and very dangerous when they carry it into practice.

"The Rascally Indian Agent" The "Rascally Indian Agent" is one of those current phrases which not only express but also help to form public opinion, and often mischievously. It is a pleasure to help remove from the pillory one who for many months has been subjected to wholly undeserved reproach. When Lieut-Col. J. H. Randlett, U. S. A., retired, assumed charge of the Kiowa Agency in Oklahoma four and a half years ago he found the Indians bitterly and justly opposed to the carrying out of a so-called agreement made with them in 1892. For that agree-

ment had been negotiated through fraud and misrepresentation. For several years, through the efforts of the Indian Rights Association and the Indian Office, the agreement remained inoperative, but in 1900 Congress succumbed to the pressure of white interests and declared that the Kiowa and Comanche reservations should be allotted and surplus lands thrown open to settlement, and the thankless job fell into the hands of Inspector Nesler and Agent Randlett. They did it as well as possible and the Indians are to-day better off for it. But there was, of course, fertile soil in which to sow the seeds of distrust and dissatisfaction and plenty of unscrupulous and interested persons to act as sowers, and so charges became rife that the agent had padded the rolls and the inspector who made the allotments had plotted frauds as well as lands. Meanwhile the Indian Rights Association had carried to the Supreme Court what became known as the Lone Wolf case, to obtain a decision as to whether Congress could legally dispose of those Indian lands without the actual and rightfully acquired consent of a majority of the tribe. There is not space here to consider the decision, which was far-reaching and adverse to the claim of Indians! Altho the Indian Rights Association had made no charges against the personal integrity of Agent Randlett, and the Commissioner of Indian Affairs had not doubted it, yet matters became so complicated and cumulative that finally the President took things in hand and selected Mr. Francis E. Leupp as his representative, to go to the agency and make a thorough investigation. It was painstaking and protracted, every possible opportunity was given to every sort of complainant to present his charges, and the result is a complete exoneration of both officials. Thus after an honorable career in the army and three assignments to Indian agencies, where he has always been a friend of the Indians and their best interests and an enemy of schemes and schemers, Colonel Randlett has again put his accusers to rout, and the old soldier in a personal letter to a friend of ours, says: "I am not sorry that I stuck to the fight, and will find comfort in viewing my scars that have been won in battling for the right."

Presbyterians on Union

Doubtless the coming together of our divided Christendom is one of the most important objects for which one can labor, but it is not important beyond all others. It is more important to be actually Christian than to show our Christian sympathy by union. So propositions for Christian union on an unchristian basis are not attractive; and so we cannot approve the plans of some of those who are trying to unite the Northern Presbyterian and the Cumberland Presbyterian Churches. There can be no union, say some, except by shutting out the negroes into separate presbyteries and synods, as brotherly relations with them are impossible, with the present race antipathy, which is as severe as that which separated Jews from Samaritans. Some say, Let them be represented in the General Assembly, or, perhaps better, be present by a commission without the right to vote. Thus it is proposed to ratify the political doctrine of "a white man's country" by having a white man's Church; and among Northern papers *The Observer* and *The Presbyterian Journal* approve, and in *The Interior* a superintendent of home missions argues for a race-divided Church. But the Southern Presbyterians, who have already cast out their Samaritans, are not disturbed on this matter. They are still disturbed over the Northern lapse from the doctrine of election before faith. That question, whether election comes before or after faith, is what separates Calvinists—that is, Presbyterians—from Arminians—that is, Methodists and Cumberlandians; and the Northern Presbyterian Moderator, Dr. Coyle, has lately said that wrangling over that matter is all wrong, and keeps up a divided Church. Such a statement pains the Southern Presbyterians, and they protest. Why, they ask, should any Calvinist forget how nobly John Calvin stood for the doctrine of unconditional election against all compromises? Why, certainly?

University Honors for Women

In London University women are permitted to work for degrees on the same conditions as men, and this

year out of eight honor candidates allowed to pass five are women, and they have nineteen out of thirty-four places in honors and thirty-five out of forty-seven entries in the first division. The Oxford and Cambridge authorities will doubtless see in this a justification of their policy of excluding women, for it is obvious that the only way of maintaining the tradition of masculine superiority in scholarship is to prevent the mentally inferior sex from competing. Probably the young men in London University, like those in coeducational institutions in this country, will soon begin to detect the tartaric acid in the grapes, and will talk of the unfairness of examinations as a test of ability, the futility of honors and the folly of working for marks. Formerly admission to the Phi Beta Kappa was the most coveted of graduate distinctions, because it was dependent upon excellence of scholarship during the entire course and also manifestation of some creative literary power, but now, when most of these positions go to women in coeducational colleges, we hear the young men loudly declaring that they do not want to belong to that "woman's club," and they devote themselves more and more exclusively to athletic games of the rougher sort, where, as yet, the competition of the weaker sex has not become dangerous.

It is news to us that there are no rich men in the Catholic Church, and yet this is what Archbishop Farley said the other Sunday in a sermon in which he attacked the intermarriage of Catholics and Protestants:

"People are scandalized because the Church has not great millionaires in its fold, and no rich marriages can be made for their children in its ranks."

We thought we had heard of one Schwab and of some others in and out of the steel industry. But in the same address the Archbishop very properly scored the audience at the Cathedral, where "the wealthiest Catholics in New York have attended," because there is still a debt of \$200,000 on the Cathedral, and the congregation has not supported it this year by \$20,000. Perhaps there are rich men in the Church after all, too many of them, and what the Cathedral needs is more servant girls.

In the Senate there has arisen such opposition to the treaty with Cuba yielding our right to the Isle of Pines that the treaty may not be ratified. We are sorry to see this opposition. Beyond question, the Isle of Pines properly belongs to Cuba. For us to keep it would be robbery. Americans have gone there and have created interests there which they do not want to have put under Cuban control. But that was their risk. Their interest should not prevent us from doing what is honest. Cuba has done well by us, and has granted us the coaling stations; why should we fail to deal well with Cuba? It is not very creditable to have the same people who would oppose the annexation of Cuba for tariff reasons insist on keeping the Isle of Pines. If the Senate refuses, there is the Court of The Hague, to which Cuba would have the right of appeal on this question not settled at Paris.

Much has been said of the grasping character of the demands for indemnity made by the missionary societies after the disturbances in China. But these societies generally accepted indemnity only for property destroyed and none for loss of life. A curious case is in evidence. The British Government exacted \$35,000 for the murder of agents of the China Inland Missions, but that society refused to receive it because it did not want blood-money, and the Wesleyan Society refused it for the same reason. Now it is reported that on advice it will be offered to the Yale University Mission for its educational work. We hope they will refuse it, and that the British Government, which was right in exacting it, will give it to the support of some educational work under trustworthy Chinese control.

Not the chinch bug, nor the fly brought in by the Hessians, nor the gypsy moth, nor the potato bug, nor the cotton-boll weevil is such a pestilent nuisance as the mosquito in its forty sorts which infests this country and to which we had become somewhat inured because we supposed we must. But now that we know that certain varieties produce painful and dangerous diseases we awaken to the

possibility of reducing the infliction. We are glad that a national society is to be formed to fight both the pungent *Culex* and the malarial *Anopheles*. The evil can be largely reduced if not eliminated at no great expense.

What are we to think of this? In Athens they have been giving a series of the plays of Æschylus, in *modern Greek*! They were a success financially, but there has been much criticism because the old language was not used. But in Chicago a number of Greeks, under the direction and drill of an American girl, Miss Mabel Barrows, have been giving the "Ajax" of Sophocles, just as the Greek dramatist wrote it, four evenings in the Hull House Theater. It was beautifully presented, the first time it has ever been played in America, altho it was given twenty-one years ago in England.

There has been much talk about the small matter of one of the numerous negro conferences held in Washington refusing by a narrow majority to indorse Mr. Roosevelt for the Presidency. Possibly those were right who declared such political action was not germane to the object of the meeting. More likely some of those who protested were less against the President than against Dr. Washington, who, they imagined, had the President's ear. But the importance of the event has been greatly exaggerated.

Now that the Senate has ratified the treaty with China, which opens to foreign trade the Manchurian cities of Mukden and Antung, we have a clearer right to demand equal treatment in those cities, whatever claim to predominance Russia may make in Manchuria. But we presume that despite the "open door" she will find some way to give the cream of the trade to Russians.

It seems to be a rather large demand that Russia is making of Japan, that she shall have entire control of Manchuria, and shall share with Japan the control of Korea. Japan cannot agree to that, and it looks like war.

The Independent

VOL. LV NEW YORK, THURSDAY, DECEMBER 31, 1903 No. 2874

Survey of the World

Panama and the Canal It appears to be admitted now that ratification of the Panama Canal treaty will not be prevented, and cannot be long delayed, by Democratic opposition in the Senate. Opponents of the President's policy hoped to control all, or nearly all, of the Democratic Senators by means of a caucus decision made by a two-thirds vote under the caucus resolution adopted about ten days ago; but before the end of last week it was asserted in Washington, upon what seemed to be good authority, that at least twelve Democrats intended to support the treaty and would oppose caucus action designed to restrain them. With twelve opposing, the two-thirds rule cannot be applied in caucus to the treaty question. Published statements from Boards of Trade and Chambers of Commerce show that the business men of the South as a rule demand ratification. In Georgia, Governor Terrell and Clark Howell by public utterances have heartily approved the President's course and warned Southern Senators that their States will hold them to a strict account if by their action the construction of the canal is deferred. The Louisiana Legislature at its special session by unanimous vote has instructed Senators McEnery and Foster to vote for ratification, and it is expected that other Southern Legislatures will take similar action. It is remarked that some Democratic opponents of the treaty are beginning to be regarded in their party as allies of the transcontinental railroads and as being willing to give up all hope of carrying any Pacific Coast State in 1904. Predictions are made that Mr. Hoar will vote for the treaty. A few days ago there was said to be some doubt as to the attitude of Mr. Hale, of Maine, but he now permits the

publication of a statement showing that he will vote for ratification.—Great Britain and Italy have formally recognized the new republic. All the great European Powers have now expressed their approval of the Isthmian revolt and, inferentially, of the course pursued by our Government. Similar approval has been expressed by several of the nations in South America, where Colombia has found no sympathy. General Reyes has been reminded of these facts by European diplomatists in Washington, who have warned him that an attempt to retake Panama would be futile, causing a war that could not fail to be disastrous to Colombia. One of them has told him that Europe will approve the refusal of the United States to submit the controversy to The Hague Court, since the approval of the Powers shows that "Panama is a closed chapter in the history of nations." Replying, General Reyes said: "I came to Washington to save what I could from a shipwreck." His formal protest has been delivered to Secretary Hay, and he will soon return to Colombia, it is said, hoping to restrain his people from entering upon hostilities. Altho Colombia could have sent no more acceptable representative to Washington, where he has been received in a friendly way, it is felt that he can now be of more service to his country at Bogota in explaining the situation and in preventing Colombia from making the blunder of attacking the Isthmus. Dispatches received by him from President Marroquin seem to prove that the situation is not understood at the Colombian capital, for in those dispatches he has been told that his negotiations, to be acceptable, must be based upon a restoration of Colombian sovereignty over the Isthmus.—Minister Bunau-

Varilla has informed the British Ambassador at Washington that Panama is willing to assume such a part of Colombia's foreign debt as would be apportioned to her upon the basis of population, and will do so whenever Colombia recognizes her independence. The debt is about \$15,000,000, and Panama's share, as measured by her population, would be about \$1,000,000. This concession by Panama preceded the recent recognition of the republic by Great Britain, whose action had been delayed by the demand of bondholders that Panama should be required to assume a considerable part of the debt.

✱

Guarding the Isthmus

It was reported from Colon on the 21st that 100 Colombian soldiers had landed on the Island of Pines, which is a part of the territory of the Republic of Panama and is situated about 35 miles this side of Panama's southern boundary. This island might serve as a base of observation. The "Mayflower" was at once sent to it, and, after inspection, the report was shown to be without foundation. Nor could any trace of the Colombians be found on the neighboring coast, where the Indian inhabitants were questioned. The earlier report that Colombian troops had been carried to Old Providence Island (belonging to Colombia), off the coast of Nicaragua and about 300 miles north of Colon, has not been confirmed. Those who were found in camp north of the mouth of the Atrato River, near the southern boundary of Panama, some time ago, probably remain there. They have not yet crossed the mountains to Yavisa, the settlement at the head of San Miguel Bay, where American marines are stationed. At the end of last week 900 marines were in camp on the Isthmus; 600 more started for Colon from Philadelphia on Monday. This week there will be 15 American war ships in Isthmian waters, 8 on one side and 7 on the other, not counting colliers. The "Olympia" has gone to Cartagena, to meet there and to bear away Minister Beaupré, who has come down to the Atlantic coast from Bogota escorted by a company of Colombian soldiers. Dispatches from Bogota say that even the women there ask to be enlisted in the army that is to move against Panama, and that the Govern-

ment waits only for the announcement that General Reyes has failed; but reports from Cauca assert that the volunteers in that province have been dismissed.

✱

The Field of Politics

It is known that Mr. Hanna has declined to serve as Chairman of the Republican National Committee during the campaign of 1904. Probably he will not retire before the meeting of the committee in June next. Secretary Root has been urged by the President's friends to accept the place, but it is understood that he has declined. It is now expected that Ex-Governor Crane, of Massachusetts, will be elected chairman. Secretary Perry S. Heath, who has been so severely criticised in the official reports concerning the postal service frauds, says to the press: "If Mr. Hanna would permit the use of his name for the Presidency, there would be no other name mentioned in the convention, and his nomination would mean the greatest Republican victory the country has ever witnessed." Mr. Heath also remarks that if he is "to be persecuted" because he is "a friend of Senator Hanna," he can stand it. Those who accuse him, he adds, are "adventurers who have made capital out of their adopted profession of reforming, and do not command the respect of thinking people." Mr. McKinley told him, he asserts, a few days before the assassination in Buffalo, that he expected Mr. Hanna to be his successor in the White House.—A canvass of all the States, made by the *New York Times*, shows that Democrats are looking for the candidate who will be most acceptable in New York. For this reason Judge Parker's name is regarded with much favor. The only other really prominent candidate in the minds of Democrats is Senator Gorman, altho Richard Olney may have the support of all, or a large majority, of the New England delegates. Delaware will ask for the nomination of Judge Gray. As a result of the persistent efforts made in behalf of William R. Hearst, he may have the support of the delegations from California, Wisconsin, Nevada and South Dakota. A similar canvass of the Democrats in Congress, many members being non-committal, places Senator Gorman and Judge Parker at the head of the list.

—After a conference with Senator Gorman, the Attorney-General of Maryland has prepared for submission to the Legislature an amendment to the Constitution designed to disfranchise all negroes who cannot read and write or have not paid taxes for at least two years preceding election day. Illiterate or non-taxpaying whites are protected by provisions modeled upon the "grandfather" clause of the North Carolina amendment.—Lawrence O. Murray, secretary of the Central Trust Company of Chicago, and formerly Deputy Comptroller of the Currency, is to be appointed Assistant Secretary of the Department of Commerce and Labor. Some desired that this place should be given to Edward E. Clark, chief of the Railway Conductors' Union, whom the President selected to serve on the Coal Strike Commission. They now say that Mr. Murray should not be appointed, because for several years past he has been an officer—first in New York and afterward in Chicago—of trust and banking corporations in which the Standard Oil capitalists are interested.—It is announced that "Corporal" Tanner, Pension Commissioner for a time during President Harrison's term, and now a pension attorney, is to be appointed Register of Wills at Washington.—In the complete report of Mr. Bristow reference is made to increases of clerks' salaries, made at the request of Congressmen, and to a number of buildings, belonging to Senators or Representatives, for which the Department for some years has been paying rent. The leases will be canceled, as such transactions are forbidden by law. One of the buildings is the property of Senator Warren. The charges upon which Senator Dietrich has been indicted relate in part to the lease of his building in Hastings, Neb., to the Department. It now appears that Mr. Waters, an officer who was recently appointed to succeed the indicted Beavers, reported two years ago that the rent paid for this building was much too high, that the contract was illegal, and that the lease ought to be canceled. His report had no effect.—Owing to what was said in the Bristow report about Judge Baldwin, Consul at Nuremberg, an investigation has been made by Mr. Pierce, one of the Assistant Secretaries of State, who reports that the Judge deserves to be exonerated.

Railway Collisions

Two railway accidents attended with great loss of life occurred last week. On the evening of the 23d, the Duquesne Limited Express, a fast train on the Baltimore & Ohio Road, bound from Pittsburgh to New York, was thrown from the track at a point between Dawson and Connellsville, Pa., and wrecked. From a west bound freight train several large pieces of timber, which were to be used as ties, had fallen upon the eastward track. While moving at the rate of 60 miles an hour, the passenger train struck this, and 68 persons perished in the wreck or after lingering a few hours in the hospital at Connellsville. Nearly all of those who lost their lives had been in the smoking car. No one in that car escaped. In the wreck it was thrown across the locomotive in such a position that steam issuing from the broken dome of the boiler filled it at once. A majority of the dead were killed by this steam. The conductor, Louis Hilgoth, fatally injured and knowing that he was about to die, used all his little remaining strength in urging survivors to procure a red light and warn another passenger train that would be due at the spot within a few minutes. Many of the passengers had been buying Christmas presents, and children's toys were scattered around the broken cars. Among those who were killed was Ambrose Good, a young man who was on his way to New York, intending to meet there a young woman to whom he had been engaged for several years, and who was making the voyage from England on the steamship "Cedric." They were to be married on Christmas Day, and to live in the home which he had bought at McKeesport with his earnings. She arrived in New York on the 25th, but he was not there to greet her. Another passenger, Robert Davison, had started for Philadelphia, where he also was to be married on Christmas Day. He died two or three hours after the collision, but not until he had dictated a brief message to her whom he should see no more. The loss of the timber from the freight car was not known to the crew of the freight train. It has not been explained why there was no employee at or near the end of that

train to watch for such mishaps.—Six miles east of Grand Rapids, Mich., on the 26th, two passenger trains on the Père Marquette Road met on the same track, one moving at 60 and the other at 40 miles an hour. Twenty-two persons were killed. It was in the evening, and a blinding storm had extinguished the warning signal light exhibited at a small station to stop one of the trains there. When the operator at that place saw the train passing, he sent word to the company's officers at Grand Rapids. Knowing that a collision was inevitable, they procured physicians and prepared a special train before it took place.

The Philippine Islands Governor Taft sailed from Manila on the 24th inst. On his homeward journey he will stop for a short time at Tokio, owing to the expressed desire of the Emperor of Japan to receive a visit from him. His departure excited universal regret. A procession of 15,000 soldiers, sailors, constables and labor unions escorted him from the Palace to the Luneta, where he reviewed it. Delegations from many provinces were present. Seventy-five launches accompanied him from the city to his steamship. In the course of his public addresses he warned Filipino officeholders and politicians to desist from speculation as to independent self-government until schools in every village should be filled with children and the masses should be better educated. Rapid promotion for deserving native office holders was promised, together with the admission of natives to a larger range of offices as the number of those competent to hold them should increase. There had been this year, he said, surprising progress in the islands, and only a few good crops were needed to cause great prosperity. But there would be losses if Congress should not reduce the tariff on Philippine products. Before leaving Manila he pardoned several Filipino prisoners and commuted the sentence of Father Leonardo, a priest condemned for assisting in burying alive the Mayor of Taytay because the latter was suspected of being in sympathy with the Americans.—Colonel Wallace, of the Fifteenth Cavalry, who has returned to

Washington from the islands, says that the first burial of a pig with the bodies of dead Moros took place under his orders in March last, the Moros being *juramentados* who had killed several persons and then been slain by the soldiers. The experiment, so insulting and shocking to a Mohammedan, had, he says, a good effect.—The contract for the purchase of the friars' lands has been signed. To provide for the payment of the \$7,239,784 required, \$7,200,000 in 4 per cent. bonds will be issued, due 30 years hence, but redeemable after 10 years at the pleasure of the Philippine Government. There will be a good market for them, as Secretary Shaw gives notice that they will be accepted as security for deposits of public money in the banks, and may be substituted for Government bonds now held as security, on condition that the bonds so released shall be used as security for additional circulation.

Cuba and Porto Rico In a telegram acknowledging the thanks of President Palma for his efforts in behalf of the treaty of reciprocity, President Roosevelt speaks of this "definite fulfilment of the obligations contracted in connection with commercial reciprocity," and adds that ratification was in obedience "to the will of the people of the United States to the effect that the good work of friendship and justice be fulfilled completely with mutual advantage for them and the people of Cuba." Recent action of the Cuban Senate points to an increase of the present Cuban tariff by an average of 25 per cent., to make good the reduction of revenue to be caused by reciprocity. The treaty discriminations in favor of imports from the United States are, of course, to be observed, but upon a basis of higher duties.—The agreement made with the Catholic Church by General Wood is involved in a bill passed (40 to 8) by the Cuban House, suspending the payment of rents to the Church by the State, including \$89,000 a year for the custom house and other buildings in Havana, and the annual charge for certain property in Santiago. The State has an option to buy all the property for \$2,000,000 in 1906, under the settlement reached by General Wood and Archbishop Sbarretti. Op-

ponents of the Church argued in the House that the agreement was illegal and ought to be declared null and void. On the other side it was pointed out that the agreement was protected by the Platt Amendment and the Constitution.—Alonzo Cruzen, Collector of Customs at San Juan, Porto Rico, has resigned, owing, it is said, to the investigation of the recent charges concerning smuggling by naval and other officers at that port.—Much complaint is made because of the depressed condition of the coffee industry, owing to the loss of the old markets in Spain and Cuba, and the small exports to this country, which, however, show a large increase over those of last year.

The Italian Cabinet

When Signor Zanardelli resigned on account of his age and infirmities, Signor Giolitti, who was called upon by King Victor Emmanuel to form a new Cabinet, found great difficulty in the task. He attempted to follow the example set by M. Waldeck-Rousseau in France and offered positions to the Socialists and then to the Radicals, but met with refusals from both quarters. Signor Rosano, who was selected to please the South, since the Premier is a Piedmontese, was accused of immorality and virtually admitted the charge by committing suicide. In spite of these setbacks Signor Giolitti succeeded in forming a strong Cabinet on a Liberal-Democratic basis, and it was confirmed by the surprisingly large majority of 167. The program announced is a business one and deals chiefly with the commercial treaties negotiating with Germany, Austria-Hungary and Switzerland, the refunding of national and municipal debts at lower interest, and the promotion of railroads owned by the State. The question of divorce laws is dropped on account of the strong prejudice against them, especially in the South. The Minister of Foreign Affairs states that the policy of the Government is for peace; that the Triple Alliance would be adhered to, and friendly relations would also be cultivated with England and France by such international visits as were recently made by the King and Queen of Italy to London and Paris.—Signor Giuseppe Zanardelli, the ex-Premier, died on the 26th at the age of 78, the last of the historic group of

revolutionists and statesmen who created New Italy. He was Minister of Justice under Crispi and constructed the Italian penal code. He was a Radical in politics and a leader in anti-clerical movements.

Macedonian Reform

Hilmi Pasha reports that the reforms demanded by the Powers in Macedonian administration are being carried out. In the vilayet of Monastir 190 Christian gendarmes have been appointed and the number will be increased by 250 as soon as suitable men can be found. One primary school for Bulgarians has been founded in every four villages, and roads and bridges are being constructed. Count Goluchowski, the Imperial Minister of Foreign Affairs at Vienna, states that it is the determination of Austria and Russia that all the reforms shall be efficiently carried out, but that they are opposed to making Macedonia an autonomous province with a Christian Governor, because this would disturb the balance of power in the Balkans. The two leaders of the Macedonian revolution, Boris Sarafoff and Zontcheff, are now in London and will probably visit the United States soon in advocacy of the Macedonian cause. They declare that nothing less than complete autonomy under nominal Turkish suzerainty, according to the plan now in operation in Crete, will be satisfactory to the Bulgarians and Macedonians, and that any reforms undertaken by the Turks will be mere pretense and unavailing. They consider Russian or Austrian control worse than the present *régime*, because under it there would not be so much hope of ultimate complete independence. It is probable that unless a considerable degree of autonomy is granted "there will be trouble in the Balkans in the spring," in which Bulgaria will feel obliged to take an active part.

Austria-Hungary

Austria-Hungary might be very appropriately called "the Duel Monarchy" from its chronic contentiousness, but the Parliaments manage to do some business between crises. At present a truce has been arranged which enabled the delegations from the Austrian and Hungarian Parliaments to meet to hear the report on the

foreign affairs of the empire and to vote supplies for the next two months. It is over a year and a half since the Delegations have met, and since the beginning of May the Government has been running without authorized appropriations. Under the diplomatic management of the Hungarian Premier, Count Tisza, the excitement produced by the refusal of the Emperor to allow the use of the Hungarian language in military orders had somewhat subsided, when Dr. von Körber took occasion to emphasize in the Austrian House of Peers the "unitary" interpretation of the compact law of 1867 and stated that it could only be modified or dissolved by a mutual agreement of both countries. This roused the national spirit of the Independence Party, and vigorous replies were made in the Hungarian Chamber, in which it was said that Hungarian Liberals had hitherto defended the dual system because it appeared to guarantee Hungarian independence, but so soon as Hungary should acquire the conviction that the compact of 1867 hindered the development of her independence she would depart from the dual basis without asking the consent of Austria. Count Tisza affirmed the independence of Hungary in regard to its own laws and their interpretation, and said that the views of Dr. von Körber were of no higher value than those of any other "distinguished foreigner," a felicitous phrase which so soothed the irritated feelings of the Hungarian nationalists that Franz Kossuth was able to induce them to cease their tactics of obstruction.

Russian Disturbances

It has been found that the extensive powers already exercised by the Governor-General of Finland are not sufficient to effect the russification of that country, and he has accordingly been empowered to remove at will mayors, aldermen and school teachers, and to stop their salaries without waiting for an inquiry or giving them an opportunity to defend themselves.—In the University and Polytechnic Institute of Kieff the treatment of the Jewish students by the authorities caused the holding of indignation meetings and rioting on the part of the students, and resulted in the cessation of work at both

institutions. As a result 25 persons, including 19 Jews, have been punished without trial by the familiar "administrative process."—The Armenian revolutionists in the Caucasus are said to be well supplied with money and arms by their fellow countrymen in Europe and America, and an uprising may occur at any time. Military power has been substituted for local police in many places, and some of the deposits of smuggled arms have been discovered. It will be remembered that M. de Plehve seized the funds of the Armenian Church last summer on the plea that they were to be used for revolutionary purposes.

The Kishineff Trial

The trial of the leaders in the massacre of the Jews at Kishineff is reported to have been very unfairly conducted, and certainly the sentences imposed are light. The heaviest are for five and seven years penal servitude, and these only in two cases. Twenty-two others of the mob were sentenced for one or two years, and the majority of the cases were dismissed. Acting, it is supposed, under secret orders from the Government, the court refused to allow the prosecution of many of those charged with the crime, and interfered with the admission of evidence to such an extent that most of the lawyers threw up their briefs and left the court on the ground that it was impossible under the conditions imposed to discover the true culprits. The Police Inspector endeavored to prove that the massacres were not planned but were merely an outbreak of the racial animosity against the Jews on account of their extortion, underselling and exploitation of the masses. Mr. Schmidt, who was Mayor of Kishineff for over 20 years, contradicted this and claimed that there had always been harmony between the various nationalities living in Kishineff. The witnesses who have testified in favor of the Jews are afraid of persecutions, and prophecies are rife that another general massacre will take place on Christmas day, which in Russia comes on January 7th.—M. de Plehve is endeavoring to have a more stringent construction put upon the laws relating to the domiciliary rights of the Jews in Siberia. At present they are allowed to travel and trade through-

out the district which contains the town where they are registered, but it is now proposed to restrict them to the town of registration lest they should get a monopoly of trade and gold mining.

Russian Socialists

The Socialist Revolutionary party issue a proclamation in which they give their reasons for the "removal" by assassination of M. Metlenko, Chief of Police at Bialystok. A meeting of the Jewish Bund and Social Democrats had been held in the forest and on their return the crowd, which included women and children, was charged by the police and many of them were maltreated. Persons suspected of being police spies have recently been murdered in several towns.—The Social Democrats in a recent secret convention of delegates from all the important local organizations repudiated the methods of terrorism on the ground of their futility, and according to the *London Times* adopted a platform which declares that the immediate political objects of the party are the abolition of autocracy and the establishment of a democratic republic in its place, whose constitution shall insure the sovereignty of a Parliament elected by universal adult suffrage; the institution of local self-government; the inviolability of person and domicile; the perfect freedom of religion, of the press, of meeting, and of workmen to combine; the abolition of the passport system; the removal of all restrictions on trade; the abolition of the ranks or castes (instituted by Peter the Great); the establishment of equal rights for all citizens, whatever may be their sex, religion, race, or nationality; the use in the schools of the mother tongue of the pupils and the permission to use the local dialects in all state institutions; the right of non-Russian nationalities to sever their political connection with Russia if they so wish; the right of every citizen to prosecute any official in the ordinary courts of law; the disestablishment of the Orthodox Church; the institution of secular and free education; the abolition of all indirect taxation and the introduction of a graduated income-tax and succession duties; the substitution of the militia system for obligatory military service, and so forth.

Japanese Army and Navy

Japan and Russia are vying with each other in the ardor of their protestations of a desire for peace and in the activity of their preparations for war. Russia is estimated to have 75,000 to 100,000 troops south of Mukden, while the Japanese have about the same number ready to start at a moment's notice, and could put into the field some 500,000, while the Russians could hardly do more than double their present force in Asia unless the war were a long one. The railroads of Japan have received orders to be ready to transport the troops to the southern part of Japan at any time. Many English army officers have proffered their services to Japan, but it is announced by the London Legation that Japan does not admit foreigners to her army even in time of war. Nevertheless, a number of young military *attachés* have started for Japan "to learn the language and study the country," and there are rumors of cavalymen from Australia and Colorado, who are preparing to enter the Japanese army. Many Japanese "civilians" are reported to be already in Korea and could enter the army there without delay. The newspapers of Japan have been requested not to print any more news about the movements of troops or other preparations for war. The students of the naval school, who were having a holiday, have been ordered to return, and the school is to be closed so the instructors can take their places on the ships. Six battle ships have put to sea, and the whole fleet of some forty in South Japanese waters have discharged their soft coal and have taken on Welsh steam coal in readiness for active service. All the dry docks of the country have been requisitioned by the Government for naval use.—England proved her friendship for Japan in a very practical manner by purchasing the two battle ships, "*Libertad*" and "*Constitucion*," recently built in British shipyards for the Chilean Government, but which were not now needed since Chile and Argentina have agreed to disarm. Russia offered \$9,000,000 for them within twenty-four hours, but the British Government raised their bid to \$9,375,000 and secured the vessels at that price. They had been tested and on six runs over a measured course made over

twenty knots. They are not of the heavy armed and armored class, but are speedy and efficient. The 7.5-inch guns on actual trial were fired eight times a minute. In case of war the Japanese steamships now engaged in passenger traffic would be at once converted into transports, and the merchantmen would be registered under British colors.

The Neutrality of China. The extent and importance of the impending conflict in Asia depends upon the position of China, which is more concerned than any other Power, since she will in any event lose to Russia her province of Manchuria or to Japan Korea, which has been in the past under her sovereignty; but it seems likely that China will be no less anxious to keep out of the fray than both Russia and Japan will be to have her, for their allies, France and England, are pledged to come to their help in case either is attacked by two Powers. Should either country feel itself in danger of defeat it would be likely to make an effort to draw China into the conflict in order to precipitate a general war or to enforce peace through the fear of it. France and England are now on better terms than they have been for a long time, and they would not easily be drawn into a conflict.—Steps are now being taken to reorganize the Chinese army, but in the dilatory and vacillating way common to that country. Viceroy Yuan Shih Kai, of whom a sketch appears in this issue, has drawn plans for the division of the army into twenty departments and creating three staff departments, and the Empress Dowager has approved of the proposed mode of reorganization, but has appointed the usual incompetent officials to the positions. The Viceroys of three of the central provinces have reported to the Chinese Board of War that there 90,000 foreign-drilled troops ready for service. This is probably the usual Chinese paper army, but Prince Yuan has about 15,000 soldiers under Japanese officers who could be relied upon. Wu Ting Fang, the former minister to the United States, has exerted all his power to secure foreign interference to protect the integrity of China, but apparently in

vain. Neither has he been able to rouse his own Government to prompt action, and he regards the partition of China as inevitable.

The Congo Despite the publication of official blue books by the Belgian Government and despite the denials from all Government officers and employees, a steady stream of evidence keeps flowing in charging that most unspeakable brutalities are still being practiced in the Congo Free State, and this, too, with the connivance of King Leopold. The latest testimony comes from Roger Casement, a British Consul in the Congo State. He has just made a 1,000 mile tour of investigation at the instigation of the British Government, and he fully confirms the worst reports of the slavery and barbarism perpetrated on the natives. Mr. Casement's tour was expected to take six months, but after the scenes he witnessed and the information he obtained in the first two months he decided that further evidence was unnecessary. The investigation, however, covered most of the "rubber zone," but pending its publication by the British Foreign Office none of the details have yet been given out, tho one of Mr. Casement's party summed up the situation by saying:

"The most terrible slavery exists, the administration is atrocious, and if there is not speedy intervention it will be too late."

Of a more pleasant reading is the report just published by the Congo Free State Government concerning the railway now being built from the Upper Congo to the Great Central African Lakes. This railway will bring Stanleyville into communication with Ponthierville by winding about the great falls, and it will open up to traffic and civilization one of the richest tracts of land in the world. Stanleyville will then doubtless become the commercial center of the district. Added to this report is annexed an account giving information relative to big game shooting in the State. The elephant, rhinoceros, buffalo, hippotamus, leopard, giraffe, zebra and all sorts of deer still abound, especially about the station of Kiro, in Lados.

Education and Religion

BY ARTHUR T. HADLEY, LL.D.

PRESIDENT OF YALE UNIVERSITY

[This discussion of a very important subject formed the substance of an address by President Hadley, not hitherto published, at the 160th Anniversary of the Second Presbyterian Church of Philadelphia.—EDITOR.]

THERE are two extreme views concerning the effects of education upon public morality. One is held by the advocates of secular schools; the other is held by the advocates of church schools. This sharp division of opinion is not peculiar to America. It is felt in every country where modern education and modern thought prevail. It takes one form in England, another form in France, and another in Germany; but the underlying issue is the same in all.

The advocate of secular schools believes that good teaching will itself make good citizens. He holds that a large part of our vice is the result of ignorance; and that if you remove the ignorance you will do away with the vice. He thinks that a large part of our errors and our crimes are due to people's failure to recognize the consequences of their acts; and that if you can inform them of those consequences you can check the tendency to crime in its beginnings. He believes poverty and shiftlessness to be so largely due to want of knowledge that if you provide the knowledge you will do away with most of the shiftlessness and the poverty.

Up to a certain point all this is true. There is a vast quantity of shiftlessness and vice due to ignorance; a large quantity of error and crime which would be prevented if the source of error could be rendered harmless at the outset. But tho you can thus remove some of the moral evils under which we suffer, you cannot by so simple a means remove them all, nor even the major part of them. The root of lawlessness lies deeper than mere ignorance of consequences. The chief source of crime is moral perverseness rather than mental deficiency. If you improve a man's intellectual capacity without correspondingly educating his moral nature, you are likely to change the direction in which his crim-

inal or vicious instincts seek their outlet, rather than to destroy those instincts themselves. When you teach a man to write you make him less liable to commit larceny, but you make him much more liable to commit forgery. When you teach a man political economy and law you lessen the temptations and opportunities for acts of violence, but you do not lessen those for acts of fraud. Few of us who have looked into the statistics of education and crime are optimistic enough to deny that they are quite disappointing. The improvement due to the removal of illiteracy amounts to something; but it does not amount to so much as we should like to see, or as was promised by the early advocates of our public school system.

The opponents of that system often point to these statistical results with ill-concealed satisfaction. They say that such consequences are just what you might expect from any system of purely secular education. They would have the training of the intellect supplemented by a special system of religious training, which should teach the pupil to use his knowledge for the service of God and the benefit of his fellowmen. If they had to choose between the two, they would regard the religious training as more important than the intellectual, and would prefer schools where the knowledge of the teachers was defective or inaccurate but the religious principles good, to those where the knowledge of the staff was better but their orthodoxy less sound. They look with grave apprehension upon the spectacle of free citizens trained in the knowledge of many things which may prove of use to them individually, but not trained in those ideas of religion and morality which have been rightly regarded as essential to the safety of civilized communities.

I confess that I share some of the ap-

prehensions of these advocates of church schools; but I am very far from agreeing with them as to the proper remedy. I do not believe that improvement is to be sought by substituting religious instruction for secular instruction, or by superadding one to the other as tho the two were separate. I do not believe that you can prepare a man for citizenship by teaching a godless knowledge in one part of the school time and a set of religious principles in another part—any more than you can prepare a man for heaven by letting him cheat six days of the week and having him listen to the most orthodox doctrines on the seventh. I believe that both in school life and in after life the moral training and the secular training must be so interwoven that each becomes a part of the other.

In any good system of education the child learns three or four distinct sets of lessons.

1. He learns a great many facts and principles which he did not know before he went to school. This learning of facts and principles seems to most people who look at the matter superficially to be pretty much the whole of education. It is really only a very small part of it.

2. He learns certain habits of accuracy. Indeed, looking at some of the schools of the present day, I am almost inclined to modify this statement, and say "habits of accuracy or *inaccuracy*;" for in the effort to put more knowledge into the child and make the process agreeable, the teacher is prone to sacrifice that thoroughness and precision which were perhaps made the too exclusive object in the classical training of an earlier generation. Along with these habits of accuracy I should place those habits of order and regularity which are not learned out of books at all, but from the quiet working of school rules and school discipline.

3. The pupil in a thoroughly good school also learns lessons of public spirit and self-devotion. He can receive these lessons from poetry and history, if properly taught—whether that be the poetry or history of the Americans or of the English, of the Greeks or of the Hebrews. He can receive those lessons from the emulation of school life, not only within the classroom, but on the playground. The good of modern ath-

letic sports is not wholly nor mainly a physical one. Athletics, when rightly managed, give lessons in self-subordination and loyalty as fruitful as those which can be received anywhere in the world. And, wholly apart from either study or athletics, the child can learn these same lessons through his admiration of the older boys and of the masters who are doing their work well. All the moral precepts which are taught, even by those head masters who have the greatest reputation as moral teachers, are of little consequence as compared with the personality of those teachers themselves. As we read the books of Thomas Arnold or Mark Hopkins we wonder at the influence which those men had on generations of English or American boys. It is because we know only the books and not the men. The doctrines put into black and white were as nothing. The personality was everything.

I am convinced that a large proportion of our misunderstandings about our school system arise from our overestimate of the importance of the first of these three elements, and a corresponding underestimate of the second and third. That we should make these wrong estimates is not surprising. The enormous widening of modern knowledge, the recent interest in science and scientific discovery, the development of new means for the pursuit of material wealth, have all contributed to that reaction of which I spoke a moment ago against the narrowness of the old classical curriculum. We have been substituting history for literature, experimental science for deductive. We have been tending to value our teaching by the practical utility of the conclusions learned, to subordinate scientific training to technological ends; and even to say that history should become an account of the habits of the mass of the people rather than of the character and influence of their greatest men. To a certain extent this reaction was justified; but I believe that it has gone much too far, and has made us lose sight of the really excellent elements which the old education contained and which the modern education may be in danger of sacrificing. Knowledge is a good thing, and the more we can get of it the better; but if we obtain a large in-

crease of knowledge at even a moderate sacrifice of the habits of accuracy and regularity, we have made our pupil less efficient instead of more so. Intelligence is a most excellent thing to help a man in the conduct of his own affairs; but if we strive to increase that intelligence at the sacrifice of those things which make for idealism and public spirit we make a man a worse citizen instead of a better one, and run the risk that in the short-sighted pursuit of his own interest he may be led to ruin himself as well as his fellows.

A few years ago this danger seemed to be a very serious one. In the college electives were multiplied without discrimination. In the high school scientific and commercial courses were established on lines which were often rather unwise. Exaggerated importance was given to shop work. Manual training was sometimes used in a way which made it not so much a training as a diversion. The introduction of kindergarten methods in the early stages of school life was guided by enthusiasm rather than by critical judgment. Fortunately, we have come to a point where signs of a strong reaction are manifest. The incompetence of most of the children trained in our kindergartens is leading educators of every stage to see that the acquisition of agreeable facts is a very poor substitute for the habit of pertinacity in dealing with disagreeable ones. The experience of scientific experts proves that when a laboratory degenerates into a shop it loses most of its value. Our college graduates of recent years find that indiscriminate election of studies has meant intellectual dissipation. In short, we have learned that the sugar plums of education do not furnish a strengthening intellectual diet. Under these circumstances we find a tendency to go back to the standards of earlier years. I do not mean that we shall ever go all the way back to the dry bones of learning which constituted so large a part of the education of our fathers; but that we shall see, and are, in fact, already beginning to see, how the discipline which went with that old education made stronger men and women than we are likely to get under teachers and school boards, who, in their pursuit of the pleasures of the new education, forget the necessities of discipline.

If we can really get into our minds the fact that in any system of education, classical, scientific or manual, accuracy and idealism are far more important than mere knowledge, we shall do away with the force of the objection that our teaching has no effect in character building. For the formation of habits of accuracy and the development of ideals are themselves the very essence of character building. The effect of this training tells in the most unexpected ways. I have known a great many Socialists, but I never knew a single one who was really careful in his arithmetic. I have known a great many shiftless and half-vicious boys who furnished unpromising material for any educational system; but my experience has been that even in these cases regularity and cleanliness were more potent moral influences than any amount of mere knowledge could become. I have seen boys and men who were selfish in all their impulses, who nevertheless responded to the teaching of ideals in the school or college as they responded to nothing else.

But if you can teach in this manner and in this spirit, the antithesis between education and religion disappears. Spelling and arithmetic, poetry and history, games and friendship, become lessons in conduct and helps to the formation of character. Under such a conception sound religious teaching is the outgrowth of good secular teaching. The use of the Bible in the schools justifies itself because it does, in fact, give those lessons in conduct and character which we regard as fundamentally important. Whenever we have tried to make Bible reading a thing apart from the rest of the school work, which we used because we thought that the Bible was verbally inspired, we found difficulty in defending our course against those taxpayers who denied that the Bible had any such special authority, and against those others who believed that there was a church authority at least co-ordinate with the Bible. But when we make our religious and moral aim as broad as our whole field of instruction, and use the Bible as we use any other book of poetry or history, then can we justify our principles in the face of all the world and look forward with confidence to the results which

will follow the application of those principles.

To sum the whole matter up: The supposed antithesis between secular training and religious training arises from a misconception of what is involved in good training of any kind. People see the difference between bad secular education and bad religious education, and they assume that there must be a corresponding difference between good secular education and good religious education. This is by no means the case. When a master of a public school is occupied only with teaching facts and principles, and when a master of a religious institution is occupied only with teaching

dogmas and observances, they necessarily work at cross-purposes; but the mere learning of facts and principles is not the vitally important part of secular education, nor is the learning of doctrines and observances the vitally important part of religious education. The formation of habits of discipline and the development of ideals of unselfishness is the essentially important thing in a good education of either kind. When we have grasped this truth we shall see that there is in the field of education the same harmony between the true needs of the world and the true needs of the Church which exists in every other department of human life.

NEW HAVEN, CONN.

The Panama Canal Question

BY PROFESSOR EMORY R. JOHNSON

MEMBER OF THE ISTHMIAN CANAL COMMISSION

THE Panama Canal question assumed definite form 25 years ago, when the concession was secured from Colombia by which the Old Panama Canal Company obtained the right to excavate a canal between Colon and Panama. The active work of the Old Panama Canal Company was carried on from 1883 to 1889, when the company became insolvent. Five years later the Panama Company was reorganized as the New Panama Canal Company, and that organization has been carrying on the work on the Isthmus ever since. The reason why the work has been carried on is that continuous activity on the part of the company was necessary in order for it to hold the concessions which it had received, with extensions from time to time, from the Colombian Government. Probably about two-fifths of the excavation work has been completed on the Panama route.

The Maritime Canal Company of Nicaragua secured a concession for a canal by the Nicaragua route in 1885, and carried on excavation work from 1889 to 1893. It, however, did not accomplish

very much during those four years, and when the panic of 1893 came on, the company became absolutely insolvent and has never been able to resume work. It has lost its concession.

When it became evident to the American people that the French were not going to succeed at Panama, and that the American company's failure in Nicaragua was complete, the American Government decided to investigate the Nicaragua route with the idea of constructing a canal by that route as a Government enterprise. Our Congress turned to the Nicaragua route mainly because it was the one in which an American company had been interested, and because the scandalous failure of the Old Panama Company had brought its route into disrepute. Two commissions of the United States Government—one appointed in 1895, and another in 1897—investigated and reported on the Nicaragua route. Early in the year 1899 Congress was about to pass a bill for the construction of the Nicaragua route when Thomas B. Reed and other leaders in Congress raised the point that the

United States had studied but one of the available routes, and that from the information possessed by the United States it was impossible to assert that the Nicaragua route was the best. This counsel prevailed, and the President was authorized to appoint a Commission to investigate the Nicaragua and Panama routes and all other locations that might be deemed worthy of study. Thus originated the Isthmian Canal Commission, which has since been in existence.

The net and final result of the investigations of the Isthmian Canal Commission was that the United States ought to adopt the Panama route, because a canal by that route would be shorter, cheaper, straighter and of lower elevation than a Nicaragua canal would be. Altho the Nicaragua location would provide a somewhat shorter route between the north Atlantic and north Pacific, the advantage thus afforded was not deemed by the Commission to outweigh the unquestionable technical superiority of the Panama route. Congress accepted the recommendation of the Commission, and on the 28th of June, 1902, the Spooner act became a law, and authorized the President to proceed with the construction of a canal by way of the Panama route as soon as he could secure possession of that route.

The construction of the canal by the Government involved certain diplomatic questions. In the first place it was necessary for the United States to secure a modification of the Clayton-Bulwer Treaty, which our country made with Great Britain in 1850. By that treaty it was agreed by the United States, and also by England, that neither party would secure or maintain control over any route of transit across the Isthmus. By the Hay-Pauncefote Treaty, ratified in 1901, Great Britain agreed to modify the treaty and to waive the right she possessed to prevent our country from making the canal a Government enterprise.

After the passage of the Spooner act it was necessary for the President to negotiate a treaty with Colombia to secure possession of the canal route. After considerable delay, due to the political conditions existing in Colombia, a treaty was agreed upon January 22, 1903, by the executive departments of the Wash-

ington and Bogota governments. The United States was extremely liberal in the terms guaranteed to Colombia, and it was definitely understood by the President and the Senate of the United States that the terms of the Hay-Herran Treaty would be acceptable to the Bogota Government, and that the treaty as agreed upon would be accepted by the Colombian Congress, which was to be convened in special session to pass upon the treaty. It was with this understanding that the American Senate agreed to the treaty. However, when the Colombian Congress was called together early in the summer it soon became evident that the treaty was not to be adopted by that Congress. The treaty expired by limitation on the 22d of September, and the Colombian Government gave no explanation to our Government for its unanimous rejection of the treaty, which we had understood to be satisfactory to that country.

As the summer passed by and it became more and more evident that Colombia was not to accept the treaty, the people of Panama began to prepare for a revolution. There is no doubt that the plan for a revolution on the Isthmus was under consideration long before the revolution occurred. As Secretary Hay says: "They prepared the machinery of revolution in advance."

The United States Government unquestionably knew that this revolution was coming. The men who planned the revolution had reasons enough for revealing their intentions to our Government. It is certain that they did so. There is, however, no evidence nor any reason for believing that our Government in the slightest degree plotted to bring about the revolution. It was perfectly evident to every well-informed person that the Panama Company and the business men of the Isthmus had adequate incentives for planning such a revolution. The United States Government needed to do, and did do, nothing but keep itself informed of what was taking place on the Isthmus of Panama. Our Government was fully aware, in the powers it possessed by virtue of the treaty of 1846, of its ability to control absolutely the situation that would result from the inauguration of the revolution.

The revolution occurred on the after-

noon of the 3d of November. Acting in accordance with instructions received from Washington, our naval officer in Colon prevented fighting from taking place either about Colon or Panama or along the line of the railroad. The United States Government recognized the *de facto* Government of the Republic of Panama on the 6th of November. The Colombian Minister, M. Phillippe Bunau-Varilla, was received by the President November 10th. On the 18th a treaty was signed by Secretary Hay and Mr. Varilla by which the United States guaranteed the independence of Panama and secured from that Republic a concession for a canal.

The President based his action upon an interpretation of the Treaty of 1846, that has always prevailed since the treaty was first made. By this treaty we guaranteed the sovereignty of Colombia on the Isthmus of Panama against a foreign Power, but *not* against its own citizens. On several occasions our Government has been appealed to by Colombia to assist the party in power against revolutionists, but it has uniformly refused to accede to such requests. The President prevented fighting on the Isthmus because to permit fighting there would cause an interruption of traffic across the Isthmus. Our country has given its solemn pledge that that traffic shall not be interrupted.

The treaty of 1846 was made with New Granada, which at that time controlled the territory across the Isthmus. Since then the authority over the territory has changed several times, but the treaty which we made with New Granada has continued. As Secretary Hay says, "It is a covenant which runs with the land."

The President has interpreted the Spooner act to give him a right to negotiate a treaty with the Republic of Panama to secure a concession. Under the Spooner act the President was authorized to treat with Colombia, but he says that it was the manifest intention of Congress that he should treat with the Power in control of the Isthmus. Whether he has rightly interpreted the law or not is a question which the United States Senate will soon have an opportunity to decide.

The resolutions presented to the Sen-

ate December 17th by Senator Hoar (than whom there is no man in public life more worthy of admiration) call upon the President to lay before the Senate all the information in the possession of the executive department, both before and after the revolution took place in Panama, so that the Senate and the American people may have all the data necessary to form a correct opinion as to the propriety and justice of the action taken by the President. In speaking upon his resolutions, Senator Hoar did not question the right of the President to recognize the new Government at Panama promptly, but stated that "what we want to know is this: Whether our administration, knowing or expecting beforehand that a revolution was coming, so arranged matters that the revolution, whether peaceful or forcible, should be permitted to go on without interruption."

Senator Foraker immediately replied to the question:

"The situation in Panama was one as to which there was common knowledge.—No agent came to the President of the United States. The President of the United States sent no agent to Panama. It was not necessary. Panama was acting in her own interest.—The clouds were gathering. Should the United States, through its administration at Washington, be unmindful of that fact? Not at all. It was our duty to be watchful with respect to it under any circumstances, but particularly in view of our obligations to preserve that transit free from interruption."

The President has transmitted copies of the correspondence and orders of the executive departments relative to the revolution, the last installment being sent to Congress December 19th.

Altho the action of our Government in recognizing the Republic of Panama was prompt, it was in accordance with precedent and apparently in harmony with the principle of international law. A precedent is found for the recognition of the Republic of Panama in our immediate recognition of the Republic of France in 1871, of the Republic of Spain in 1873 and Republic of Brazil in 1889. The recognition of the Republic of Panama by several European countries followed close after our action; and some of the South American countries have

already entered into relations with the new Government on the Isthmus.

The ethical and political questions connected with the Panama revolution are somewhat complicated, but there are certain facts which throw light on the subject. (1) Panama had the right of revolution, and also had justifiable grounds for "resuming" her independence. (2) Our obligations under the treaty of 1846 require us to prevent fighting on the Isthmus in the only section of the country where fighting could defeat the revolution. The people of Panama, in this instance, instead of the Colombian authorities, were the ones that were aided by our action; but our duty to maintain order would have been the same had the effect of our action been the opposite. (3) The conditions being such that the success of the revolution was a certainty, it was proper for the President to negotiate a treaty with the Republic of Panama guaranteeing the independence of that country and arranging for the construction by our Government of a canal by the Panama route.

The people of Panama have, it is true, been extremely fortunate. Our enforcement of the provisions of the treaty of 1846 has enabled them, without our giving them aid directly, to accomplish their independence without bloodshed. The people of the United States have been fortunate, because the success of the revolution on the Isthmus has enabled us to secure promptly a concession for a canal, much more favorable to us than the concession we were to have received from Colombia. The entire world is fortunate, because the events of the past few weeks make practically certain the early inauguration of the work of constructing the great waterway. Favorable action by the United States Senate on the treaty now before that body is probable. When that action is taken our country will enter at once upon the execution of what President Roosevelt rightly terms "a project colossal in its size and of well-nigh incalculable possibilities for the good of this country and the nations of mankind."

PHILADELPHIA, PA

The House With the Green Door

BY SEUMAS MACMANUS

LONE is the house of my Love,
The house with the green door,
That opened to let my Love in,
And opened never before.

It shut behind her that day;
In my face blew the bitter rain;
I cried aloud at the door,
Calling her name—in vain.

Oft I went back through the storm,
Strong the impulse that bore me,
Stinging the sleet in my face,
And chill the welcome before me.

It opened but once before,
Once it will open again,
The house with the green door
And noiseless bolt and chain.

Many my fruitless journeys;
Yet, some time the light will burn,
And friends watch late, in my house,
And I shall not return.

I shall have found my welcome,
And a wide-thrown green door:
And I will tarry in my Love's arms
Shut close for evermore.

MOUNT CHARLES, IRELAND.

Shanghaied

BY JAMES H. WILLIAMS

[Mr. Williams in the following article describes the events that led up to his most recent deep sea voyage, taken a year or so ago, from which he has just now returned. It will be followed by another article, telling about the actual life of the sailor on a modern ship and how the ship is made to go. Our readers now should need no introduction to Mr. Williams, nor any assurances that these "yarns" are as true as they are interesting.—EDITOR.]

THE practice of obtaining recruits for maritime service by means of fraud, impressment, or misrepresentation is as old as the history of over-sea ventures. In the olden days the cupidity of designing men was abnormally heightened by exaggerated reports of riches to be easily obtained by barter or conquest from the innocent natives of strange and distant lands. Christopher Columbus had unintentionally discovered that the world actually extended beyond the known horizon of human investigation and that there were still other worlds to conquer, and other peoples to subjugate.

From the beginning the sailor has been the slave of the monger and the chattel of the crimp. It is more than probable that the crews which manned the caravels of Columbus on his first voyage to the coast of America were either impressed or forced by royal decree to accept this service in exchange for a harder fate in Spanish dungeons. It is a well known fact that in the seventeenth and eighteenth centuries English criminals were given their choice between sea service and imprisonment as a punishment for their misdeeds. It is also highly probable that similar measures were taken by other countries to keep up their sea prestige. And it is no secret that in America criminals have been allowed to choose between a ship's fore-castle and a prison cell in the latter end of the nineteenth century. In all ages the odium of slavery has attached to seafaring men in a greater or less degree, and they have never yet been able entirely to free themselves from the shackles of "commercial expediency."

Christopher Columbus was a sailor, the greatest sailor of his time, yet history records that he died a miserable death

in a dismal dungeon and was buried in his shackles. His degradation may have been due to jealousy and ambition, instead of business expediency; but his end was, nevertheless, symbolical of the sailor's fate.

There are but three ends to a rope: this end, the other end and overboard. And there are, likewise, but three ends to a sailor's existence: to live, to suffer and to die. The man is a sailor by nature, not by selection. He cannot hope to escape his fate, for Destiny has marked him for her own. He must live to suffer and to die, but woe unto the man who unnecessarily augments his sufferings or anticipates his death.

To certain natures the dangers and delusions of a seafaring life are irresistibly attractive, and onerous indeed must be the conditions which can force them to change their bent. But cruelty and injustice have often driven the sailor from his ship, as a fire in the jungle would drive the tiger from his lair.

The press gangs were a necessary, if not legitimate, institution under the piratical conditions of sea service obtaining one hundred years and more ago. And the crimping system is equally essential for the protection of commercial arrogance to-day. Piracy, slavery and impressment have all been suppressed by means of stringent laws. But the more insidious crime of *shanghaiing*, or fraudulent shipment, still lives and flourishes in the dark.

In England the old press gangs were paid from the bounty of a desperate Government in sore need of recruits. But in America the crimps have always lived on "blood money," and the sailor has been compelled to pay for his own degradation.

To the enterprising crimp everything

is fish that gets entangled in his net, and men are shanghaied for the "advance wages" alone, which the ship owner is always ready to pay, whether they be sailors or not. The tales of the fore-castle are replete with the names of men who in the olden days earned world-wide reputations as masters in this nefarious business.

What sailor has not heard of "Shanghai Brown," Harry Walters and Paddy West, the famous celebrities who years ago drove our sailors from their ships and filled our forecastles with the "rakings and scrapings of Hell and Newgate."

The shanghaied victim is always either enticed on board under some mental delusion not to be realized or driven on board by some force not to be resisted. A dead body was once carried on board a ship and deposited in a bunk in the fore-castle under pretense that it was a drunken man, and two months' advance was collected for the "stiff" before the gruesome hoax was discovered. The master of a Norwegian ship was once "shanghaied" at New York for a common sailor and found himself on the way to sea in a Yankee ship when he awoke from the effects of the drinks and drugs which had been given him. Fortunately for him he was recognized by the pilot, who had brought his ship into New York a few days before, and the captain was obliged to send him back on the tug boat from Sandy Hook. On another occasion a minister was enticed out to a ship in a small boat and "shanghaied" on the pretext that a dying man on board wanted the consolation of religion. I have never heard how the sky-pilot enjoyed his trip, but I should like to have heard his first sermon after he returned. I'll wager he did not have to look for a text.

Such instances as those cited above could be quoted by the score, and just so long as the sailor remains the property of the vessel and the chattel of the crimp, the latter will persist in the game of "shanghai," and take his chances with the law. Stop the advance and you stop the crimp; release the sailor and you protect the country. For a free man will fight to maintain his freedom, but a slave must cringe at his master's feet.

But I must proceed to relate how I

came to get "shanghaied" last voyage, and what came of it.

I arrived in Norfolk last March with fifty dollars, a clear conscience and a roving commission. Soon after my arrival I met my old shipmate and crony, Spike Riley, similarly equipped.

Together we proceeded to enjoy ourselves and celebrate our chance meeting. For three days we lived on the fat of the land. On the fourth day we lived on free lunch and promises. The fifth day was Sunday and Spike borrowed forty-five cents from a homeward bounder.

About 9 o'clock that night we went up to the "Sailors' Mission," where they say you can get a decent night's lodging for twenty cents, and coffee and rolls in the morning thrown in.

When we reached the mission there was a Gospel meeting in progress, so Spike and I decided to wait outside the building until the services should end before applying for a bed.

While loitering outside the Mission, listening to the music of the organ and the psalm singing chorus within, we were approached by a well dressed, affable young man, who at once engaged us in conversation. He was very polite and well informed, and overflowing with sympathy for the poor, despised sailor. By the cut of his jib I took him at first for a commercial drummer, or a professional "con" man. But we soon made him out to be a full fledged Jackal looking for "raniks" to ship for advance notes. He soon persuaded us to go with him down to the boarding house and have a talk with the "boss."

Having got us in tow, he led the way down a lot of dark streets in the direction of the place. On the way thither thirsty Spike suggested that it was a long while between drinks, whereupon our friendly Jackal promptly offered to show us where to get the best whisky in America for 5 cents a drink and set 'em up himself. He said the place was kept by a friend of his and that we would have to be very quiet to gain admission, as it was Sunday night.

Debouching from the main street into an alley, our pilot led us to a gate in a high board fence. Opening this, we passed into a good sized yard in the rear of a large house, with a back kitchen.

The kitchen window was closely screened by a blanket suspended from the top of the frame. Feeble streaks of light filtered through the ragged edges here and there, and the hum of mingled voices was plainly audible from the outside; but the interior was completely eclipsed and secure from observation.

At the door our pilot gave three mysterious knocks and then we waited. Presently a small slide in the panel was pushed back, a bleary eye peered out at us and a thick voice said huskily, "Who dat?"

The Jackal gave the password, then the big wooden bar across the inside of the door was let down and we walked in. The bar was at once replaced, and we were told to "go right into the back."

The porch was divided by a thin board partition into two rooms, and the further or rear room was used as the Sunday bar room. Here we found assembled a motley crowd of both races and both sexes—mostly mixed-ale tanks of the genus *bum*, all eagerly waiting for a drink, a racket or a graft.

The bar, a slapped-up affair of pine boards, was reeking with the overplus of stale beer, and was presided over by a sinister looking "cracker" with a freckled face and a "Cro' Jack" eye.

"Step right this way, gents," he said in a voice intended to be reassuring, as we pushed our way through the crowd of star customers to reach the bar.

The Jackal told us politely to "order 'em up." Spike called out for "kill me quick," while I sung out for mixed ale. The slinger said that the crowd had drunk him all out of beer and whisky, but that he still had an excellent quality of gin left.

After consultation, Spike and I agreed to compromise on the gin. When the slinger drew the cork from the gin bottle the fumes that ascended were almost audible. I rather incautiously remarked that that kind of gin didn't need advertising. The diabolical scowl which the slinger bestowed upon me for making this remark should have been enough to remind me of my manners, but it wasn't. And when I innocently inquired if the stuff was made at the Standard Oil works, I forgot that I was in the region of lynch law.

The next thing I noticed was a big black bottle sailing along in my direction with all the poise and dignity of a three-inch shell on a war errand.

Long experience in the management of shivering sails had taught me to dodge by instinct in times of danger. So I stooped just a fraction of a second before the well meaning bottle whizzed past my head and was shattered on the wall behind me. Spike said afterward that a miss was as good as a mile.

Spike and I had been in many a tight place before and understood each other's moves perfectly. The bums who frequented the place began to manifest a sinister interest in the proceedings at this point, and we both knew that prompt and decisive action was necessary on our part to preserve our skins.

After dodging the bottle, I instantly made for the big bum doorkeeper, who was preparing for action, and landed like a whirlwind on his solar plexus. He doubled up with an agonized grunt and went stern first through the flimsy partition into the outer room. The partition collapsed with a crash, and at the same instant loyal old Spike reached up and extinguished the lone gas jet burning over the bar, leaving the place in total darkness.

Then Spike and I got together—we could tell each other by the feel—and while the "slinger" was cursing and searching for the fugitive match-box Spike and I stumbled over the wrecked partition and made for the door. Near the door we got into a mix-up with several of the bums, but the friendly darkness protected us from missiles, and we finally broke away and got the door open. We ran out into God's night and took leg bail, followed by a volley of curses and saloon furnishings.

At the street corner the glare of the electric light protected us from pursuit, and we paused to take an inventory of ourselves. Spike had a long scratch on his face that must have been executed by one of the ladies who were present at the fracas. He also had the property match-box, which he had been thoughtful enough to grab from the bar during the excitement to prevent the bloodthirsty slinger from relighting the gas. Foxy Spike!

I had a promising contusion on the right cheek, which next day blossomed into a splendid black eye. In a few minutes we were rejoined by our whilom friend, the Jackal. He apologized for his "friend's" conduct toward us, saying that he was too drunk to appreciate a joke. He told us not to mind, however, as we could get a drink "down to the house." So "down to the house" we went, fit and proper candidates for a trip to Shanghai.

"The house" was a dilapidated, ramshackle old structure, that always threatened to tumble down to avoid condemnation proceedings. It stood somewhat back from the street, as tho conscious of its own disgrace, and was surrounded by the rotten and decrepit remains of an ancient picket fence.

We found "the boss" seated in the large kitchen, which also served as a sitting-room, surrounded by a number of turnpike sailors, whom he was entertaining with an impromptu discourse on the advantages of a seafaring life and the merits of a high advance system.

He (the boss) had a red mustache, a redder face, a glad hand and a pleasant look, and wore a "hard hitter" well poised on the back of his bullet shaped head, just as it might have hung on a peg.

The Jackal introduced Spike and me as "two old friends of his in search of a ship." "The boss" thereupon extended his "glad hand" and gave each of us a shake that reminded us of a main jib sheet "in stays" in a stiff sou'wester. After that he produced a black bottle and a white tea cup from a neighboring closet and told us to make ourselves "at home." Spike ignored the tea cup and only used the black bottle. I used them both in mine, and when the "boss" asked my opinion of their contents, I just gasped and reached for the water pitcher standing on the table. I guess he took me for a nautical tenderfoot.

In answer to our inquiries "the boss" informed us that shipping was fine, never better. A lot of good ships on hand and no crews to man them. He advised us to become his guests for the night and have a good breakfast in the morning, which would cost us nothing, and after which we could see the shipping master

and pick our own ship. The night being now far spent, we decided to accept this generous invitation, and asked to be shown to bed. "The boss" lighted a tallow candle and led the way.

Across the broad, old-fashioned hall and up the wide, bare stairs our footfalls resounded through the house with that lonesome distinctness that tells of complete emptiness and long abandonment.

Opening a door at the head of the stairs, "the boss" ushered us into our sleeping apartments. The room looked dingy and neglected. The walls, which had originally been painted pea green, were covered with dust and hung with cobwebs. The broken window panes had been thoughtfully replaced with bundles of old rags and newspapers. The floor was bare and unswept, and the bulging ceiling threatened to descend and join it at any moment. The furniture in the room consisted of four small iron bedsteads with dirty bedding and a mantelpiece. Three of the beds were occupied, so it was arranged that Spike and I, being chums, should "double up" in the fourth.

"The boss" apologized for his lack of accommodations, saying that he had just started in business and had not yet had time to get in his furniture.

Placing the candle on the mantelpiece, he bid us a cordial good-night and withdrew, leaving us to make the most of our situation. While making a furtive survey of our room and room mates, and an incidental bluff at undressing, Spike requested me (*sotto voce*) to examine the sheets and ascertain which side had been used the most. I presently reported that both sides were positively dangerous and showed a number of tangible, indisputable reasons for my belief. In this dilemma there was nothing left for us but to "carry the banner" till morning, which we decided to do. We experienced no trouble in getting out of the house (you could get out of it almost anywhere). So we passed out again into the purer atmosphere of God's night and bore each other company till morning. About 7 o'clock we returned to the house and found all hands astir. A loud sizzling from the kitchen range proclaimed that breakfast was getting under way, and the aroma of burning fat filled the

house. "The boss" saluted us cheerily. and hoped we enjoyed our night's repose and our morning constitutional. An early stroll was a fine thing for the health, he said, as he showed us the water tap and towel (?) in the back yard. We had a wash. I wiped on my handkerchief, while Spike, who was minus such a luxury, used the lining of his vest.

At 8 o'clock breakfast was announced, and wet sat down to a substantial meal of fried beef, slightly overdone, vegetables, rye bread and coffee.

There were several unfortunate beggars in the house, but only two of them appeared to be sailors. But any man that can walk is worth a month's advance to Crimp & Co.; so what matters it what becomes of him or the ship after the note is cashed?

Nothing occurred during the forenoon, altho Spike and I hung around the house in hopes that something would turn up. At 1 o'clock dinner was served, consisting of rye bread and stew.

About 2 o'clock our host informed all hands that the shipping master was outside and wanted to see us. We found him standing outside the broken down fence waiting to receive us. "The boss" introduced us to Mister Cassidy, as the leading shipping agent of the port, and advised us to listen attentively to what he had to say. Mister Cassidy was a large, florid faced man, with a checkered suit, a red necktie and a dazzling smile.

After surveying us critically, Mister Cassidy proceeded to unfold the tale of our prospects for the immediate future. There were several ships preparing for sea, he said, but only one was ready, an English tramp bound to the Orient, which would sign a certain number of men to fill her complement as soon as practicable.

If any of us desired to go, he continued, we would receive four pound five shillings per month, one month's advance, a good outfit and a square deal.

An hour later, eight of us, including Spike and me, assembled at the British Consulate to "sign on."

The clerk read over the shipping contract in a rapid, monotonous, perfunctory way that was barely audible and never intelligible. The only part I heard distinctly was the final, when he raised his

eyes from the paper and looked from the crowd, and said emphatically, as tho quoting from memory, "no liberty or money in foreign ports except at the master's option, and no grog allowed."

Having finished our business for the day we returned to "the house" and waited for supper, which was served at 6 P.M., and consisted of bloater, bread and tea.

By this time special arrangements had been made for Spike's comfort and mine. We were given clean single beds in a room by ourselves and enjoyed a fair night's rest. Next morning all hands were called at 5.30 and ordered to prepare for sea.

We were each given a glass of whiskey in lieu of breakfast. Each man was given a bundle supposed to contain his sea outfit, then we shouldered our bags and tramped together down to the wharf, escorted by a crowd of Jackals. Here we found a tug boat waiting with steam up ready to transport us and our belongings down to Lambert's Point to join the ship. An hour later we were alongside the big tramp ready to be delivered over to our new masters. For a short time all was bustle and excitement, getting our bags and belongings on board and getting ourselves settled in the forecabin.

Mister Cassidy had promised to settle up with us on board for the balance of our advance wages in accordance with the square deal clause in his ante-signing declaration. While we were getting settled down he went up to the captain's room to sign the new cook, who was to take a "pier head jump"—that is, sign on board. The cook signed for \$25 advance, and Mister Cassidy went ashore to cash the note, promising to return soon and settle up all around.

I think he must have been unavoidably detained, for up to the time the ship sailed, four hours afterward, he had not returned, and we never received the balance of our advance.

When I came to examine my "good outfit" I made the following inventory of account between Mister Cassidy and myself, and all the others did likewise. The bundle contained the following articles, to which I have appended the full market value:

One straw mattress, or "donkey's breakfast"	\$0.50
One small quilt, at 3 for \$1.00.....	.35
One suit dungaree, boy's size, and worthless to me.....	.75
One pair bluchers, boy's size, and worthless to me.....	1.00
One "cheap jack" razor and ditto strop....	.75
One sheath knife and belt.....	.50
One pound of tobacco and one doz. matches.	.50
One day's board.....	1.00
One bottle of rot-gut whisky.....	.25
	<u>\$5.60</u>
By cash.....	3.50
	<u>\$9.10</u>
One month's advance.....	\$20.56
Value received on account.....	9.10
	<u>\$11.46</u>
Balance due me on sailing.....	\$11.46

We all knew that we had been buncoed and that we would have to work a month for Mister Cassidy before we could claim anything for ourselves. The two "raniks," who had never been to sea before, were shipped as able seamen and charged \$10 each for the chance. The cook was also charged \$10, but actually gave up \$25. And yet the navigation laws of all nations strictly prohibit the taking of "blood money" and "shipping fees."

The two "raniks" were afterward reduced to the grade of ordinary seamen by the captain, and *very* ordinary they were. But what did the crimp care tho we had to stand their wheel, keep their lookout and do double duty in general on their account? Didn't he get just as much for a "ranik" as for a sailor?

When Spike relieved me on the look-

out at eight bells that night he laid his hand on my shoulder and said in his old familiar, jocular way, "Well, sonny, I guess we got shanghaied this time. But, never mind, our turn will come yet, for 'every dog has his day.'" "That's so, Spike," I assented, "and vice will bring its own vengeance as sure as 'virtue is its own reward.'" We work hard for little thanks, and give far more than we get, but we can go down the world singing chanties at our work because we are honest. The crimp may live in luxury, but he never can know the true happiness we enjoy at sea, sharing each other's confidences and labors and sorrows. Eventually the crimp must hang himself with his own rope, and every dollar wrung from the sailor's blood will be a nail in his coffin. Good-night, Spike; nothing in sight."

Walking aft to the bridge I reported to the officer of the watch: "Spike Riley is on the lookout, sir; lights are bright and all is well." "All right," he said gruffly, "that'll do the watch." Ten minutes later I was stowed away in my bunk, where the friendly old Atlantic, lapping and roaring against our bows, and the nor'west wind singing in our rigging, soon lulled me to sleep.

What did I care for crimes and crimps? The prince of crimps was never so happy as I.

NEW YORK CITY.

First Ascents of the Hoh Lumba and Sosbon Glaciers in the North West Himalayas

BY FANNY BULLOCK WORKMAN, F.R.S.G.S.

[Mrs. Workman, with her husband, Dr. William Hunter Workman, are among the most celebrated living mountain climbers. They are joint authors of "Sketches Awheel in Modern Iberia" and "In the Ice World of Himalaya." Their home is at Worcester, Mass.—EDITOR.]

THE first part of this year's exploration, our second consecutive season of high climbing in the Northwest Korakaram, was accomplished by the ascent of two hitherto unvisited glaciers, the Hoh Lumba and Sosbon, which run northwest from the Braldu Valley, in Baltistan, or Little Tibet. The Sosbon, in fact, does not exist on any survey map, and the larger Hoh Lumba, which is indicated on the map, but had not before been surveyed, we found of very different topography from what we had supposed.

In the sixties considerable attention was given to mountain surveying by the great Trigonometrical Survey of India, the work then being in the hands of able English surveyors, who, so far as they went, did their work well. They had, however, much ground to cover in a season and had not the mountaineer's outfit

necessary for surveying at high altitudes. The lower parts of some of the important Baltistan glaciers were surveyed by them, the upper two-thirds being filled into the map according as they may have seen portions from a distance, or more often left to the imagination. Such was the case with the Hispar, Biafo and Baltora glaciers, first really explored by Sir Mar-

tin Conway, and with the great Chogo Loongma, which we were the first to explore to its source at about 19,000 feet last season. Some of the great peaks are accurately fixed by the Indian Survey, having been triangulated usually from some distant point where they were well seen. This triangulation is regarded as more or less accurate according to the

number of rays or angles observed in determining the position or height of a given summit, all peaks fixed by more than two rays being considered sure as to position.

The Indian Survey has done little mountain surveying of late years in either the Eastern or Western Korakaram, it being thought of more importance to the Government to employ the few trained men they have at command in work nearer home, or further afield on Government expeditions in Central Asia,

Tibet or South Africa. Private expeditions requiring a surveyor are the exception in the Himalayas; in fact, in the last ten years I know of no party except ours which has required the services of a surveyor. The valley leading to the Hoh Lumba glacier in the province of Braldu is reached after more than three weeks' marching from Srinagar, the capital of

On the Cornice of Col des Aiguilles, 18,600 Feet Above Sea Level, Hoh Lumba Glacier. Photographed by the Author.

Kashmir. This valley, or nullah, as they are called here, begins at the village of Hoh, 9,400 feet altitude, and is a narrow precipitous ravine ascending in about nine miles to a high grazing meadow at 11,800 feet, into which the moraine covered snout of the glacier descends.

Wangmah Tapsa, native name for this green meadow, watered by mountain rivulets and overhung by great snow crested peaks, was by 4 P.M. on June 19th sprinkled over by the largest colony of tents it had ever harbored, for no European, except now and again a stray sportsman in quest of ibex, ever invades its elevated isolation. Our caravan was large, consisting of ourselves, a surveyor,

two noted Italian guides, Petigax and Savoie, who accompanied the Duke of the Abruzzi on his polar trip; a porter, four native servants, a village chief at the head of sixty coolies for carrying baggage and wood for snow camps, and, finally, the live stock, sixteen goats and twelve sheep, which climb over rocks and glacier as nimbly as guides. The coolies

are a motley lot, lazy, improvident and without conscience, who would not go at all on snow were they not ordered by the Government, and who, in spite of such commands, are almost sure, at camps of any height, if foul weather sets in, to desert in large numbers, leaving one helpless so far as transport goes. But the coolie is a factor to be endured and contended with in the Asiatic mountains, and the only chance of carrying out any work there is to have an interpreter and head chief stationed at the last village, who, when the men come down, send up others as quickly as possible. Even this is hazardous business, for one may be doomed to wait in some dangerous place, which, with faithful porters, could be quickly left should a serious storm occur.

Such are the irritating conditions of high travel in Asia, for which there are but two compensations, the new ground

to be investigated, if one goes far enough, and the absolutely peerless snow and rock scenery.

The winter had been a very late one throughout the mountains, but we rather expected, as had been our experience in the past, to find earth slopes on mountain flanks or moraine edge, where tents could be placed, as high up as 14,000 feet, but here we were disappointed. After climbing a thousand feet over the glacier end we arrived on a long ridge of moraine, from which a winter locked vista of snow covered glaciers and great rock or ice peaks swept forward for miles. Lower mountain spurs, which should by the end of June have offered a little grass for our

goats, were snow patched to where they joined the glacier. The glacier, here splitting into various arms, instead of ascending in a long, simple stream as on the Survey map, showed few crevasses, these being hidden by a solid covering of driven snow. Truly the hand of winter still held its firm grip over the middle mountain world.

Great Peaks of Hoh Lumba Glacier

Making up our minds to camping on snow from the first camp, we quickly decided to send back the goats and sheep to the Tapsa, where the latter could be killed as needed and sent on to us. The only animal, except a polar bear, which could possibly thrive in this Arctic world was the ibex, which we saw grazing in large herds on the barrenest high spurs. They must have discovered early grass, but to our eyes none was visible. The next problem was to discover the main glacier in the glacial complex, and altho it was clouding in and cold, map and compass were brought into requisition. Having decided on the largest glacier, which appeared to ascend in about the direction of the one given on the map, we continued to climb this.

By 3 P.M., as it was snowing briskly and the coolies were loudly expressing dissatisfaction with their surroundings, a

Camp at Top of Hoh Lumba Glacier, 15,600 Feet
Above Sea Level

favorable bivouac was sought. A flat snow surface near a glacial water pool for our tents, with some rocks below to shelter the coolies' tents, was found, and we proceeded to make ourselves comfortable. At least, it was not necessary to melt snow to obtain water on this occasion, and all water buckets were speedily filled lest the reservoir should freeze over in the lowering temperature.

The coolies were given shelter tents and a little of our precious stock of wood to make their chepatties, large flat cakes made of coarse flour, the only food they have, except on occasion when they are given a sheep. This diet is evidently nourishing, for these Baltis are far stronger and more able to climb and carry loads than are the Kashmiris, who live on rice mostly. It is the moral fiber that is wanting in the Balti, not the physical.

It snowed and blew most of the night, then cleared, and by 6 A.M., when we wished to set the camp in motion, tent pegs were frozen hard in the snow, requiring hammering out with an ax. Water in buckets in side tents was solid ice and the thermometer showed twenty degrees of frost. This was at 14,400 feet and as cold as we had had it at 17,000 last summer in July. A bright sun, however, proved most ameliorating, and by 7.30 on the march one was quite ready to discard warm coats.

The scenery at this camp was magnificent, and continued to increase in grandeur as we ascended, keeping us constantly occupied with the cameras. Excellent progress was made throughout

the morning. Toward its culmination the Hoh Lumba spreads into an oblong snow basin, circled in by lines of immense granite needles, whose great knife- and sword-like forms, dashed with fresh snow wherever it could lodge, presented one of the most impressive and bizarre mountain scenes I have met with. The grépon and other aiguilles of the Mt. Blanc chain, transplanted here, would be but the veriest offshoots of these ethereal towering pinnacles of Himalayas. In all the great mountain ring there was but one depression, a snow col connecting two tall peaks, which was perhaps climbable, and where a look toward the beyond, so alluring to the mountaineer in unexplored regions, could be had.

To arrive at the base of this col there was still a sweep of ascending glacier which would take the coolies more than an hour at their waning gait to reach. With the guides we pushed on, leaving them resting and grumbling below. At the base of the col, on a snow slope, safe from avalanches, we lunched and discussed the chances of an ascent the next day. An hour passed and not a coolie appeared in sight. At last the cook came up to say the coolies would not come higher, as many were ill and there was neither water nor rocks where we wished to camp. True, it was an inhospitable place to put up in, not a rock in sight, no water, only the great snow expanse stretching below and the grim, pitiless mountain sentinels watching above. But camp there we must if the great col was to be reached the day after; so I remained where I was, while the others went down to drive the coolies up. The height of this spot, where we passed two nights, proved to be 15,600 feet, and a more blazing sun reflection than I experienced there while waiting between 1 and 2.30 P.M. I hardly recall. It was not the highest sun temperature by any means that we have observed at great heights, for the solar radiating thermometer by my side registered at highest 170 degrees F., but the day was windless, and the heat concentrated and enervating.

At last the coolies came dragging along, some snow blind, because they would not wear their snow glasses, others affected by mountain lassitude, or feign-

ing to be. The sun left the camp at 4.30, and by 5 P.M. it was freezing—strange contrast to 170 degrees in the sun three hours previous.

No cooking could be done except the warming of tinned meats and vegetables over a primus stove, and the melting of snow and boiling of water for tea, being accomplished in the same manner, was a long and irksome process. At 4.30 the next morning, under a clear sky and in a temperature of 20 degrees F., we stood adjusting the rope before the start for the mountain. The ascent over preliminary snow fields was steep from the outset. We had expected to find a way up a great sirac ice fall, but on reaching this it was found too formidable; so we decided to skirt an ice slope, cross a yawning bergschund and traverse some abrupt snow slants perched above a series of perpendicular precipices upon the incline of a tall aiguille to the right of the col, a not much easier performance than plunging into the siracs would have been.

By the time we arrived at the upper snow slants it was necessary to eat something, for we were thoroughly chilled and it was colder than when we left camp, the sun not being destined to strike our route for another two hours. After a kola biscuit and a bit of congealed meat, we were off over the difficult slants, which a clinometer showed to rise at a little over 60 degrees angle. Absolute silence reigned on the rope, except for the sharp click of the ice ax in the frozen surface as the leading guide chopped out each step. On we went, higher and higher, sometimes traversing, sometimes straight up a snow arête, catching now and then glimpses of our tents poised like flies on the snow fields 2,000 feet below. The strain of several hours on the precarious snow slants was at last relieved when we arrived on a plateau, where we rested a few minutes before attacking the final thousand feet to the top. This last was a trifle less steep, but the heat became as oppressive as the cold had been painful on the early part of the ascent, and we felt the effects of the rarefied air somewhat, having come up within a week from the steamy Shigar and Braldu valleys.

These annoyances were all forgotten, however, when, on finishing a snow

slope, we realized the top of the col was reached. Great peaks loomed ahead from the Shinza side, and we were pushing forward toward it all, when the head guide, Petigax, called "Halt! C'est une cornice." We instantly stopped, made aware in a moment as we glanced around that we were standing on a huge curling snow cornice overhanging a terrific precipice. This rounded ice tongue projected far beyond the main mountain, and having consequently no support, any sudden impact on its surface might cause it to cave and disappear into the abyss below. Even when they appear massive it is never safe to trust to the strength of a cornice. We moved cautiously back to a solid snow hummock higher up, where we could stop in safety and view the scene. Held firmly by the other guides, Petigax advanced slowly out upon the cornice, feeling each step, to where he could look down seven thousand feet or more upon a large glacier. Finding this could be done with safety by one person at a time, we each in turn went out to have our look over the wonderful cornice and upon the sea of peaks belonging to an unknown, unexplored world of eternal snow.

Standing alone upon that relentless,

Looking Down from Snow Camp on Sosbon Glacier

glistening monster cornice, where two or three steps forward might precipitate one into eternity, was a sensation never to be forgotten. As every Alpinist knows, such moments are stupendous, more awesome, yet filled with more keen enjoyment of the world around, than are months of ordinary existence. The wind lashed my clothes about me, and of a sudden, realizing its power, I turned and joined the others in their place of safety. Here we gave our attention to cameras, hypsometers and aneroids, and having noted our observations and taken in the glorious sweep of the Hoh Lumba and its splendid peaks on the other side, we began the descent, not stopping for lunch until we reached a snug plateau, where a summer temperature again reigned. The great snow cornice 18,600 feet high we shall call "Needle Ridge," after the aiguilles which adjoin it on both sides, until the Survey of India gives it a better name. In view of what we found there, one thing is certain. The Hoh Lumba on our map later will no longer appear with a long, easy pass at its head running gently down to the Hispar glacier.

After lunch there were still all the bad slants and arêtes to be covered again in the softening snow, and we well knew that after 3 P.M. not one of them would be safe from avalanches. It was only 1.30 and the snow still in fair condition; so, tightening the rope between us, we pressed on, warned by Petigax to tread lightly and not to talk in crossing "*le lit des avalanches*." By constant attention to every movement made all went smoothly, and by 3 o'clock we reached the safer snow fields and saw our tents awaiting us in the basin below. At camp we were besieged by coolies begging us to descend at once, or they would all die. Such interviews are of daily occurrence at snow camps and must be treated lightly. We gave them some tea and told them to wait until morning.

The ascent of the col had been made just in time. The following day we went down to the entrance of the Sosbon glacier, and following that up a short distance, were driven to camp in a fierce snow storm. This storm, with a few breaks, lasted fully eight hours, and it

was two days before the snow settled enough for us to go higher.

During our detention there thirty coolies came up to our tents and asked for their pay, saying they wished to leave. Their wages were, of course, refused; but they left just the same, quite oblivious to the fact that we could not move either up or down with a half force of men. In two days others were sent up, and we continued our climbing on the Sosbon, a large and beautiful glacier with numerous side branches, running northeast of the Hoh Lumba. While exploring this corner of the Himalayas we were camped nine nights on snow, experienced several severe snow storms and suffered a great deal from cold. A number of coolies became ill from altitude and cold, and two were reported dead; but the report proved false, and the majority returned to Hoh in good condition.

To my taste the most striking, wildest and most impressive scenery in the world is to be found in the northwest Kora-karam Himalayas. There looms the second highest peak of the world, K², 28,250 feet, and those averaging from 20,000 to 26,000 feet may be counted by hundreds. Beyond this the multiplicity and beauty of shape are marvelous. In the really high mountain world, above 13,000 feet and bordering the finest glaciers, there are no peaks of conventional form, no "writing desk shapes," such as one hears of in the Canadian Rockies; but wherever you go, on the Biafo, Chogo Loongma or other large glaciers, a vast conclave of splendid summits, varying from the most bizarre aiguilles to the stateliest domes, each different from the other and bearing some particular charm or characteristic, and added to the multi-form cachet of all hovers the supreme fascination of great height found nowhere in equal degree outside of the vast chain of Himalaya. The greatest drawbacks to exploration there are the inferior coolies, the changeable weather and frequent storms which visit this region, produced no doubt by the summer monsoon in India, and the hardships of the constant snow camping necessary to reach peaks or important passes.

BOMBAY, INDIA.

Reminiscences of Washington Before the War

BY GRACE GREENWOOD

THO I was the first of my unfranchised sex to serve as a regular correspondent at the capital, there had been for some time on the field an independent lady journalist, whose name, Ann Royal, has left some lingering echoes in the minds of the oldest inhabitants. Her paper, a dingy little sheet, which she published herself, was portentously entitled *The Huntress*. It drew its precarious sustenance mostly from Congress, in ways I never could approve. It was given to personalities, dealing especially with new members from the rural districts, whom it praised or criticised according to the figure of their tribute money. It was a grim little black-robed Diana whom I more than once beheld in the corridors of the Capitol, stalking big game, armed with the subscription book of *The Huntress*. It was said that certain gentlemen encumbered with "a past," or an awkward present, subscribed to that sheet every time they thus encountered its terrible editress.

Another odd character of that time to be seen sauntering about the Capitol, or posing at the entrance of the National, or Willard's, was known as Beau Hickman, a showy, but rather seedy and slouchy, variation from the old Bath and Brighton type, but every whit as cool and easy as Nash, and impudent beyond a Brummel's imagining. His wits seemed slight, but he lived by them some way, in fact, old Dorrit's way, by collecting tribute from nearly all who came under a certain indescribable charm of voice and manner. This was before the revelation of hypnotism. General Sherman once told me of an encounter with this unworthy, on his first visit to Washington. The young lieutenant was grave and stern of aspect beyond his years, but that was "no let" to the Beau, whose glittering eye and silvern speech soon drew from the young soldier's light

purse its largest silver coin, the dollar of our fathers. Another friend told me of one of Hickman's artful devices, not this time for raising, but for evading, tribute. On a rainy summer night journey to New York my informant found himself seated with the Beau, who was next to the open window. He wore a straw hat, in the band of which he had stuck a card, doing duty for a ticket. When the train was fully under way, Hickman thrust his head out of the window to see if it still rained, and finding a down-pour, drew it in so quickly that he lost his hat, ticket and all! The latter loss he much deplored to the conductor, just making his first round, and that stern functionary, with a shrug and a grim smile, passed on. Then the exultant Beau opened a modest satchel and drew forth a traveling cap. Catching his neighbor's quizzical glance as he donned it, he gave a wink of infinite impudence and settled himself to repose.

The winter of 1852 was a gay Washington season, socially, musically and Terpsichorally. In drawing-room and ballroom dancers were crazy over the polka, with its tireless charging and backing. In the theater we had the charming Catherine Hayes, the Irish nightingale; Ole Bull and other stars, followed by a fiery little meteor, known as Lola Montez. Those were the days when famous foreign dancers created such furores as only supremely great singers or emotional actresses with "problem plays" can give rise to now. Fanny Ellsler captivated playgoers everywhere along her course, young men and old men being alike dazed and delighted. The venerable chief magistrate of a New England State confessed to having paid a startling price for a first-night box, but added, "I don't regret it. I would give fifty dollars any day for one of her smiles."

But Ellsler was an artist as well as a

pretty woman. Montez was a prettier woman, but not an artist. She was a sort of self-made *danseuse*, and dated, not from Seville, but from Limerick, and she was Mrs. Neill, divorced from Captain James, *et al.*, but *née* Gilbert. It were scarcely possible, and surely unprofitable, for me to give here a tenth part of her fantastic story, whose daring adventures and mad pranks were best left as "copy" for sensational novels and plays. After taking "Spanish leave" of her husband, Captain James, in India, she studied Spanish dancing in Spain for a while, and was, it was said, "adopted" by a rich old Spaniard named Montez, who was her generous banker all through her tumultuous career. She seems to have been rejected as an artist or ejected as an intriguer from most of the capitals of Europe before her disastrous Bavarian *régime*. Old King Ludwig, captivated and enthralled, bestowed on her a small palace in Munich, a title and "much monies." Yet she was not happy. She aspired to the dignity and power of a vice-queen. With a bigger brain of her own, and a bigger monarch to be swayed by it, she might have been another Pompadour. As it was, she was more a mischievous than tragic element in high political life. She was quite too limited in intellect and education to wield that indefinable, sinister power of "the strange woman," fully equipped, before whom great rulers, statesmen, philosophers and even saints have succumbed and brave soldiers have held up their hands. Lady Hamilton is the latest historic example of this class, unless they have recently killed one in Servia. But Lola Montez was a big enough adventuress to cause a rising in the capital city of a considerable principality, the abdication of the King and her own banishment. While her laurels were still green and dewy she came to us. It happened that she made choice of the same steamer which brought to us another European celebrity, whom I think I have already mentioned in these papers, Governor Kossuth, of Hungaria. An officer of the ship once gave me an amusing account of the persistent tho quiet efforts made by the dancer to throw her toils about the hero, as day after day she sat near him on the deck

at points where it seemed her challenging eyes must encounter his straying regards. But that hero's sad eyes were always turned westward with as tense and piercing a gaze as once seemed from the eyes of Columbus to call forth through the billowy horizon a new world. Too grand and solemn were the exile's meditations, or too absorbing his wild hope, to allow his truant glances to rest on the lovely, languid face of the charmer—besides, his faithful wife was always by his side.

Tho our household in Washington did not then know much of the strange history of Madame Lola Montez, Countess of Landsfeldt, we suspected that she was not a nice and proper person; yet curiosity just dragged us all to the National Theater on her opening night. I can recall more clearly than many a grander scene her entrance in the ballet. She did not bound or glide onto the stage. She seemed whirled in like some gorgeous tropical flower on a gust of a summer storm. She seemed afloat on the music. Her costume of scarlet and gold was brilliant in the extreme, her poses were unconventional, her art—well, few thought anything about it while that dazzling vision was in sight. Her beauty was remarkably delicate and piquant and at times appealing and melancholy in expression. Her chief charm lay in her eyes—dark, magnetic, with long, heavy lashes, which were wonderfully effective. It certainly was a rare type of beauty. When, the next year, I visited Munich, I found a portrait of the Countess of Landsfeldt, by Kaulbach, occupying the place of honor in a small special gallery in the royal palace containing the pictures of all the famous court beauties of that time. I rather liked the constancy of the foolish but genuinely fond old Ludwig, who never would believe his Egeria as bad as the world made her, and she doubtless had some weak leanings toward good. Our guide told us that she was very charitable to the poor, especially unfortunate children, and merciful to dumb animals. Washington was hardly a field of the cloth of gold for her dainty, twinkling feet. It was not then, as it is now, rich in millionaires and their spendthrift sons—no "smart set" dominated its society.

Our President, Mr. Fillmore, was not a man of fashion, but a very proper and domestic chief citizen, and it would have required more than the nerve of any king's ex-mistress to invade the *pene-tralia* of the White House. The majority of Congressmen were intensely absorbed in the slavery question, and our great statesmen, old and worldly wise, were probably immune. So she did not tarry long in the then crude and much scattered capital, but returned to New York, where she kept herself in practice as a charmer, somewhat of the Circe sort, in Bohemian circles. Apropos, I find in Mr. Longfellow's Diary a sad little record of a young Polish Count, for whom he had done much, finally raising the money to pay for his first-class journey home, the young fellow, with all his accomplishments, not being able to make his way in America. The record ran: "The Pole we all took such sad interest in has been in New York and in a row at one of Lola Montez's supper parties."

After a triumphant tour of the States the dancer flitted to California, where she saw life under countless new aspects, each one wilder than the last. She flung herself with reckless abandon into that rough, adventurous life—danced and lectured without fear of critic or censor, rode wild horses, tamed bears, shot at and lashed her enemies, flung about her money, and married right and left. After some stormy years she returned to New York in broken health and also with what seemed "a broken and a contrite heart." She took to religion in the unsectarian and poetic form, administered by the Rev. Mr. Harris to a small, independent, intellectual congregation. She was apparently much changed morally, even before the cruel stroke which left her utterly helpless. One of the charitable ladies who cared for her told me that her fierce, rebellious nature seemed utterly subdued—that the great dark eyes, through which had blazed such lawless passions, such sinful beguilements, were at the last humbly and tearfully fixed on the cross of Christ. A few years later, on wandering through Greenwood Cemetery, I came upon a lowly, lonely grave in a little three-cornered lot, marked by a small white stone bearing the simple inscription:

"Mrs. Eliza Gilbert, died February 17th, 1861, aged 42."

It was the grave of Lola Montez. She had asked to have her maiden name alone on the headstone. I could hardly realize that after such a wild swing at life, from continent to continent, she had been limited to so narrow a domain. How that little triangular hedge seemed to imprison the willful, untamable creature, that elfin rebel against society, that Zingara of the world! How heavily the earth must rest, I thought, on that wild, inconstant heart, passionate as fire, unstable as water. How could she lie so still in the darkness who had seemed like some gleaming tropical bird, gay and fierce and restless?

That winter of 1852 was the last I spent in Washington for many years. Then for many years it held my home, and in spite of much wandering in many lands and a later home, it is still inexpressibly dear and beautiful to me. It is the flower of the Republic.

I love to remember how pleasant were to the last my social relations with my Southern acquaintances and relatives, in spite of radical differences of opinion on the slave question. Strangely enough, I found Southern women the most courteous in argument and considerate in judgment; while during and after the War they proved more passionately belligerent, more bitterly irreconcilable, than Southern men. It was their inflexible pride, their grand courage and constancy, their sublime patience which would not let them down easily and gradually, when hope was no more for "the lost cause." Tho we hear no longer of "the bloody chasm" dividing the South from the North, I am not so happy as to believe it has yet been completely bridged over by philanthropists and politicians, novelists and dramatists and World's Fair directors. It is still of the nature of a long burial trench, and must be filled up from end to end with the dead of a generation or so. When they of both sections who dug it, or who have lengthened and deepened it, are buried in it, they or their memories, their sinister renown, their wrongs, enmities and resentments, and the dust of a little time, counting days as God counts them, shall have settled on it;

when branching vines of mercantile interests and social intercourse shall stretch more thickly across it; then every wind of heaven will bring there seeds of charity and gentle relenting, wild poppies of forgetfulness will bloom, and friendly daisies nod above it, and at last great harvests of peace and union will hide it from view forever. *Selah!*

I remember with keen interest yet a trip to Mount Vernon, made with the Kossuth party, one day of the early spring. It was especially pleasant to me from the fact that the entire party were admitted to the interior of the quaint old mansion, usually jealously guarded against Northern sightseers. The then owner, Mr. John A. Washington, a grand-nephew of the Pater, talked freely with his foreign guests, apologizing, tho with the inextinguishable dignity of a Virginia gentleman of the olden time, for too evident indoor shabbiness and outdoor dilapidation, by frankly stating that he could not afford to properly keep up the priceless property, and could only be reconciled to parting with it to the Government, which had thus far failed to accede to his patriotic estimate, some two hundred thousand dollars. Things out-

doors, as well as in, had evidently been tidied up for this visit; the house servants wore neat gowns and jackets, and even the olive branches in the negro quarters were decently clad; whereas, in my visit of the summer before I had seen children of at least kindergarten age skipping about or lying basking in the sun quite *in puris naturalibus* and apparent beatitude. Of course, an unclothed negro child is far less nude than an undraped white child, but the sight was sufficiently startling, and the whole place had a sad, neglected, drifting-back-to-Nature look, even to Martha Washington's old garden, where a few old-time flowers seemed making a ghostly effort to break through their winding-sheets of weeds and clover.

But within a decade, as we know, a noble association, mostly of patriotic women, headed by a devoted Southern dame, changed all that through a grand subscription-raising crusade, aided and inspired by a second Peter the Hermit from Yankeeland, and redeemed, beautified and preserved for all the life of the Republic its most sacred and beloved pilgrim shrine.

NEW ROCHELLE, N. Y.

The Friendship of a Tree

IN MEMORY OF ELIZABETH OF AUSTRIA

BY OLIN ALFRED CURTIS

"In Gödöllő habe ich einen Baum, der mein bester Freund ist. Jedesmal, wenn ich dahin komme, und wenn, ich wieder von dort weggehe, beuge ich mich zu ihm, und wir sehen uns einige Minuten lang schweigend an. Der alte Baum weiss alles, was in mir wohnt; und ich vertraue ihm alles an, was mir in der Zwischenzeit, wo wir einander fern gewesen sind, begegnet ist."

THERE came a time when men were far,
And Christ himself I could not see,
Then, like the creatures of the air,
I found the friendship of a tree.

He stood there silent in his joy,
He did not try to speak to me,
And yet I knew, without a word,
I had the friendship of a tree.

And now I meet him day by day;
In rain and wind I watch his glee;
My restless sorrow builds a nest
In mystic friendship with a tree.

DRESDEN, SAXONY

The Real Rulers of China

BY ROBERT ELLSWORTH LEWIS, M.A.

AUTHOR OF "THE EDUCATION CONQUEST OF THE FAR EAST"

IT should not be thought that there are no strong men in China. The lamentable fact is that during the past two years none of them have been in the Wu Wei Pu, or Foreign Office, with Prince Ching, the amiable.

A cablegram from China in regard to the Manchurian question says: "As a result of patriotic meetings called because of the situation in Manchuria, the Viceroys and Governors have telegraphed to the Grand Council at Peking, urging the Chinese Government to resist foreign aggression."

Once before the pressure brought to bear by the "Viceroys and Governors" stiffened the vertebrae of the Foreign Office in regard to Manchuria. On a notable previous occasion, in 1900, the "Viceroys and Governors" refused to follow the Peking mandarins into war against the world, tho they had been strictly charged to do so.

But Viceroys Liu Kun Yi and Li

Hung Chang are no more. Who, then, are the great men of present day China?

The one constructive statesman in Heaven's Empire is Viceroy Yuan Shih Kai, who rules over the metropolitan province of Chili, in which are the great

cities of the North. He has prevailed upon the Dowager Empress to buy up the telegraph system, which threads the Empire, and operate it as a Government monopoly. He has gathered up enormous Oriental power by being appointed Commander-in-Chief of all the modern drilled troops of North China, in addition to his civil viceroyalty. He had previously utterly suppressed the Boxer movement in the province of Shantung, and is now bringing order out of chaos in Chili.

Viceroy Yuan has had the honor of inaugurating modern education by Government in Shantung and Chili, culminating in two new universities, the former planted under the guidance of Dr. W. M. Hayes, and the latter by Dr. C. D. Tenney, both gentlemen having formerly been missionary educators. The Viceroy is now attempting to reorganize the banking system of North China, with what success we

are not able to judge. The one cause of adverse criticism and distrust of Yuan Shih Kai is that in 1898 he is supposed to have betrayed the confidences of his Emperor, which led to the dethronement and suppression of the young monarch.

H. E. YUAN SHIH KAI,
Metropolitan Viceroy of China and Commander-in-
Chief of China's Northern Troops

The scene was highly dramatic. The Emperor had met his chief confidential advisor, Kang Yu Wei with the confession, "I have great sorrow in my heart which cannot be described with pen and ink," and followed it with the command, "You must at once proceed abroad and devise means without a moment's delay to save me." His Majesty then confided his plan for overawing the Dowager and her chief military commandant, Yung Lu, and asked Yuan Shih Kai to pledge the service of the German-drilled army. Yuan assented, but hastened to Tientsin, 80 miles by rail, and allowed Yung Lu to know of the Emperor's plan. The next day, September 28th, 1898, Yung Lu and the Dowager suddenly forced the hands and the throne of the Emperor, and Kang Yu Wei became, and still is, an exile.

There is something pathetic in the present struggle of Viceroy Chang Chih Tung to maintain his leadership in the Councils of Empire in the face of his calumniators. He has recently completed an overland journey from Wu Chang and presented himself at the court of the Empress Dowager. Viceroy Chang has been for twenty years one of the great men of the Orient, and, tho he has had lucrative posts, he is not a rich man. This cannot be said of any other long prominent mandarin, and indicates why his opinions have received unusual consideration; he is financially honest. It is also a fact that he is notable in literature and a Confucianist to the core. But his worst enemy has been vacillation. I spent a winter's evening, not ages ago, with Professor Brill and his associate at

Wu Chang, both of whom had been called from Cornell to organize and develop Viceroy Chang's Agricultural College. I shall never forget the accounts then given of the obstacles placed in the way of the practice of their profession by the Viceroy and his mandarins. After interminable delays they were granted leave to visit the not distant farming districts, in order to inspect the native methods and results. But, to their dismay, they had superimposed upon them one of the "Fathers and Mothers of the People."

Hence they journeyed in state. The people were of necessity respectfully quiet and distant, and the tour resulted in little, except to convince the mandarin that the Professor was somewhat worse than a dreamer of agricultural dreams.

The Oriental and Occidental agricultural tasters sat in the cabin of one of their houseboats while on this tour of inspection, and were discussing American agriculture. The American was asked, who worked his father's farm. The reply was that the

H. E. CHANG CHIH TUNG,
Ruler of Central China

father and his three sons did the work, and that upon the farm, among their stock, were one hundred cows. The mandarin detected a flaw in the evidence, and was convinced that the American did not know the A, B and C of farming. He made his doubt and suspicion clear by the incredulous and stinging question: "How, foreign teacher, could your father and his three sons plow with one hundred cows?" It was of no avail to point out that the cows should not be used for plowing purposes, for that was a brazen insult. "What else could cows be used for?" And thus it has been

with most of Viceroy Chang's innovations.

Colleges by the half dozen have been started, manned, neglected. Cotton mills, modern streets, rickshaws, and a hankering after new, unworked schemes, have been his undoing in Wu Chang. It is expected that he will now be elevated

to the Grand Council or Cabinet, at Peking, where his advice on matters of state ought to be of some value; tho he is a pronounced enemy of the advanced reformers.

He has left as acting Viceroy of Hunan and Hupei provinces his Excellency Tuan Fong, who as Governor of Shensi

H. E. TUAN FONG,
Formerly Governor of Shensi, now Acting Viceroy of Hunan and Hupei, and his two Sons

in 1900 ignored the orders of Prince Tuan to extirpate all foreigners in that province, and instead, so carefully protected them that not one was killed by the Boxers. Tuan Fong is one of the coming men of Heaven's Empire.

Another Viceroy with a remarkable record is H. E. Tsen Chun Hsuen, who has just been sent to Kuantung and Kuangsi provinces, of which Canton is the capital, to restore order in that riotous

section, from which we have been getting such exaggerated reports of "rebellion," "anarchy" and "bloodshed."

No doubt, Viceroy Tsen will restore order, for that is the way he has of doing things. After the Boxer holocaust in Shansi Province, he supplanted the infamous Yu Hsien, and order prevailed as if by magic through all

H. E. TSEN CHUN HSUEN

that anthracite region. In 1902 palpitation of the heart seized the correspondents who contemplated the new Boxer outbreak in the Empire Province of Szechuan, but in three months' time H. E. Tsen, who was dispatched thither, had robbed the situation of all sensational features. And now he has gone to Canton as a pacifier, and peace "will follow in his train."

With such men of experience and sense in office in China, supported by the less

prominent but thoroughly modern Wu Ting Fang, Sir Chen Tung Liang Cheng, Shen Tung Ho, Prince Su, Prince Chen and Sheng Kung Pao, it is difficult to believe that the soft spoken effeminates of the Peking Foreign Office will be allowed to give Russia a quit-claim deed to Manchuria, Mongolia and Eastern Turkestan.

SHANGHAI, CHINA.

Serum and Vaccine for Tuberculosis

BY DR. ALEXANDER MARMOREK

[It has been known for some time by those interested in the treatment of tuberculosis that Dr. Marmorek, the distinguished bacteriologist, who for the last ten years has been connected with the Pasteur Institute and has been well known all over the world for his investigations into the curative properties of various blood serums, was making observations looking to the cure of tuberculosis, by means of an antituberculous serum, and the prevention of tuberculosis by means of a vaccine. He made an authentic report of his results before the Academy of Medicine in Paris, on November 17, 1903. This will be published in detail in the French medical journals, but realizing the interest of the communication, we have succeeded in securing advance sheets of his manuscript before its publication even in France. Dr. Alexander Marmorek was born in Vienna about thirty-nine years ago. After brilliant studies in his native country he became attached to the Institution of Pasteur in Paris in 1893, where he discovered an antistreptococcal serum. This proved useful in the treatment of puerperal fever, erysipelas and septic conditions. For his work in biology he was made Chevalier of the Legion of Honor in 1899. Since then he has been studying tuberculosis, and has prepared an antituberculosis serum from which he has obtained positive results. He has obtained some remarkable cures with this remedy, and only extreme cases fail to be benefited by it. Dr. Marmorek's discovery has attracted widespread attention, and there seems no doubt that he has added distinctly to our knowledge of the pathology and treatment of tuberculosis. Dr. Marmorek speaks English with fluency, has a most agreeable personal presence, and is an indefatigable worker. He is a Jew and ardent Zionist, and is a member of the Comité D'Action Sioniste.—EDITOR.]

DR. ALEXANDER MARMOREK

DESPITE the failure of Koch's tuberculin, what he accomplished convinced all bacteriologists that there would eventually be a biological remedy for this most dreaded of diseases. His observations, far from proving helpful, have led other investigators astray. The question of what the true rôle of tuberculin is has always remained undecided. Is it the true toxin

of tuberculosis, or is it some side product? In looking for the answer to this question, we are especially struck by the very unequal effects which the same dose of tuberculin produces in various individuals. As is well known, tuberculin injected into healthy individuals produces no reaction. Injected into individuals suffering from a mild form of tuberculosis it often produces a very severe reaction; while in those suffering from the most serious forms of tuberculosis and with extensive lesions it does not always produce a very great reaction.

In patients suffering from tuberculosis of only moderate intensity, the explanation usually given might be considered sufficient. This represents an animal as becoming more and more sensitive to the action of a toxin, which has already been produced in certain lesions in its own tissues. It leaves without explanation the well-known local reaction by which the chronic inflammation set up in an affected part shuts in the bacillary foci, and utterly fails to make us understand how an animal, for instance, suffering from severe form of tuberculosis may give a very mild reaction, or even fail entirely to show the typical symptoms that usually follow an injection of tuberculin into a

tuberculous animal. Instead of the reaction, which according to the theory we should expect, there is exhibited a very marked insensitiveness to the tuberculin. We must ask, How is it that the sensitiveness disappears just when, according to the theory, it should become most accentuated?

Let us recall, in order to realize exactly the pathological situation just how the bacillus of Koch is circumstanced in its ordinary focus. It is usually enclosed either in white blood cells, or in a giant cell. Here it seems to secrete so little toxin that it is only when there is a very large number of the microbes present that it produces any appreciable change in the general condition of its host and victim. Let us, however, touch the bacillus by a minimal dose of tuberculin, which dose, it must not be forgotten, is diluted by the fluids of the body and produces its action, not on any one, but on all the foci that may be present. What is the result? The tuberculous organism which is supposed to be sensitized to the effects of tuberculin allows several hours to pass without presenting any symptoms. It is only after a distinct, often rather long interval, that the tuberculous foci begin to be aroused, and the whole body feels the effects of the poisoning which ensues. We must add, besides, that the tuberculous patient soon tires of giving the typical reaction, and if the injections of tuberculin are continued, the sensitiveness to its action diminishes constantly, instead of increasing, as we would expect, according to the theory usually accepted.

We considered ourselves, therefore, justified in the presence of these contradictions in refusing to admit that tuberculin is either the direct cause of the symptomatic reaction which follows its injection, or that it can possibly be a substance identical with that which the bacilli of tuberculosis produce in the affected individual, and that it cannot consequently be the ultimate chemical reason for the "consumption" of the organs and the destructive progress of the tuberculosis. We may add at once that all difficulties disappear if we substitute for the usually accepted opinion as to the action of tuberculin an-

other hypothesis. This hypothesis is that the tuberculin is only in reality a preparatory material, a reactive substance which produces its effect upon the bacilli, excites their vital activity and thus determines them to the production of an abundant toxic secretion quite different to the tuberculin itself,—that it is, in a word, only a key that unlocks the bacterial cells.

We have had a number of serums prepared by means of tuberculin, and investigators are still at work at them. As these investigators, however, are working with a substance which only plays a subsidiary and fortuitous rôle, if any at all, in the pathogeny of tuberculosis, it is not a matter for surprise that these serums wrongly called anti-tuberculous, since they are really only antituberculinous, have no influence on the lesions or the course of the disease.

If our hypothesis is correct, and all that we have said seems to point to this, the starting point for a serum must be the toxin whose existence we have presumed. Experiment and observation must give us the positive proof, both of its existence and of its action. If, as we think, the bacillus of tuberculosis has so far not produced this toxin outside of animal bodies, it is because the conditions under which it has been cultivated are not sufficiently like those which exist in the tissues where it is usually formed.

In a short communication made to the International Congress of Medicine at Paris in 1900, we insisted on the varying phases of the life and growth of the bacillus of tuberculosis. The young bacilli, which we called "primitive" forms, have different color reactions, and therefore also different biological qualities. Our first step, then, was to employ these young microbes which are surrounded by a very thin covering of wax and fat for the delicate work of producing a toxin. These bacilli produce only a small quantity of tuberculin, and only very slowly. Tuberculin, however, would only be in the way in the search for another toxic material. We soon found that these primitive bacilli, which cover in ten to twelve days almost the whole surface of the liquid in which they have been

sown, do not secrete any toxin in the ordinary bacteriological media. It is necessary to cultivate them in conditions that resemble more closely those in which they grow in animals.

As the bacillus forms the toxic substance that we were looking for, where it is usually found in the animal organism—that is, in the interior of white blood cells—the idea occurred to us to have them grow in contact with white blood cells that had been freshly obtained. The attempts made in this direction were long and laborious, but without success. We found, however, that serum could be obtained by the injection of white blood cells into animals that was a more favorable medium.

The primitive tubercle bacilli only grow with difficulty on this medium, but by patiently selecting hardy colonies and adding a certain quantity of glycerinated bouillon, success eventually crowned our efforts.

The filtrate of these cultures of the tubercle bacillus in its leucotoxic serum medium does not contain tuberculin, but another toxic substance. The new substance is quite different from tuberculin in this respect, that tuberculous animals are not more sensitive to it than healthy ones. If this feeble toxin be injected into horses an œdema is always produced, which sometimes is quite extensive. In order to increase the toxicity of this substance, we tried a number of media, some of them new, all of them mixed with our prepared serum, but without any satisfactory result. One important point had been secured. The bacillus could be made to produce the true toxin. The only task before us was to keep the bacillus in its primitive state long enough to permit of an abundant secretion of toxin.

In the course of our researches one fact impressed itself upon our attention. This was the existence of a certain degree of immunity on the part of the liver to the invasion of the bacillus. It is a matter of constant observation that laboratory animals, even in the midst of generalized tuberculosis, present tuberculous lesions in the liver only very late in the disease, and the liver often remains entirely free, tho other organs may be crowned with tubercles.

In order to explain this resistance, the anatomical conditions are not of themselves sufficient. There must be some chemical causes capable of arresting for some time, at least, the development of the tubercle bacillus. If, however, the microbes can be forced to live and are cultivated on a medium of which the liver is a part, one might be able to raise a hardy race especially adapted to overcome these preventive substances. The necessities for the bacillus to defend itself constantly would increase all its vital qualities and would probably also add to its power of producing toxins.

It was no easy task to accustom the bacillus to this new and unfavorable medium. But once we succeeded, the microbes grew more rapidly and more abundantly than in other culture medium, and to our gratification also retained their primitive characters much longer. They were also more virulent, so that injected into animals they rapidly produced generalized tuberculosis. After several generations of growth in this medium, the observer is struck by the absence of tuberculin. There is, however, another toxic substance of quite a different character. One is tempted to believe that these two substances exclude each other, and that the bacilli are not capable of furnishing both at the same time. This is perhaps the explanation of the feeble and late appearance of tuberculin among sufferers from generalized tuberculosis.

There were two experimental methods by which we could prove that this substance was really the toxin of tuberculosis so long sought. The first method was to immunize animals by means of the toxin against a subsequent infection from the bacilli. We succeeded in this. By using twenty-five to thirty cc. of our toxin in several injections of four to five cc. each time, we were able to make guinea pigs immune to subcutaneous injections of an emulsion of one or two drops of a medium opalescent with active tubercle bacilli. This result is a complete confirmation of the identity of our toxin with that which the bacillus secretes in the tubercle. There was another way, however, of showing this. By immunizing animals

with these filtered cultures we obtained an antitoxic serum. For this purpose we had recourse to horses. They react very markedly to increasing injections of the toxin. Large and painful patches of œdema occurred, which were absorbed only slowly. It was hard to accustom the animals to the injection, and at least seven to eight months were necessary in order to prepare an efficacious serum.

It must not be forgotten that ordinarily, when tubercle bacilli are injected into animals, they produce abscesses at the point of injection. Even if exposed to very high temperatures, or killed by strong antiseptics, they are not digested by the white blood cells which, however, promptly englobe them. When tubercle bacilli have been long in contact with our leucotoxic serum, however, this does not happen. When injected they disappear without leaving any trace; only rarely does a slight infiltration persist. In no case does the vaccine produce a true infection. As soon as we discovered this, the idea came at once that we might be able to immunize animals. There seems to be room for the thought that the absence of immunity in man proceeds from the failure of the white cells to digest the bacilli. After we had succeeded in injecting quite large quantities of bacilli thus prepared, into rabbits and guinea pigs, without producing serious effects, we proceeded to inject them with ordinary tubercle bacilli, but found the animals resistant to them, tho control animals suffered severely. In six or seven days this vaccination can be secured. In rabbits it lasts for at least two months. We then tried the curative effect of the serum on animals proved experimentally that the serum overcomes the tubercle bacilli. As yet large doses are needed. It must not be forgotten, however, that we experimented with animals of very great sensitiveness, and whose natural means of defense against the disease are very insufficient. The rabbit requires less serum than the guinea pig. Man with many more means of defense against tuberculosis ought to be greatly benefited by our antituberculous serum, and accordingly we began, cautiously at first, its em-

ployment. It has been used now in a large number of cases for nearly a year and with excellent results.

Every one knows how hopeless are cases of tuberculous meningitis. I may say at once that we did not succeed in saving any of them. Most of the symptoms, however, were ameliorated at once. The pulse and respiration, for instance, became better, the paralysis abated. The coma usually disappeared. The meningitis was prolonged to an unusual degree, even for this affection, which is so rich in surprises. It would seem that the tuberculous toxin, like the tetanus toxin, for instance, is already united to the cerebral cells when the first marked symptoms of the disease occur, and then, of course, it is impossible to disunite them or to influence the meningitis itself. Besides, the cases were brought to us only very late, in the diseases in no case before the seventh or eighth day; often not until the twelfth day, or later. Earlier serum treatment might still prove effective.

With regard to patients suffering from advanced forms of tuberculosis, with abundant expectoration containing numerous bacilli, fever and had general condition with cavities, we had more encouraging results. The expectoration diminished and the number of bacilli decreased. The dyspnea promptly disappeared and auscultation and percussion showed a retrocession of the disease. Our experience shows that it is not so much the extent of the lesion as the length of time it has existed that makes it refractory to treatment. A large recent lesion can be cured more easily and more quickly than a much smaller one that is older. We found that even under unpromising circumstances good results could be obtained in bone and joint tuberculosis, in tuberculosis of the glands and in bladder tuberculosis. The cure of some of these cases as the result of serum injection when no other treatment was tried is equivalent to a scientific demonstration of the efficacy of the serum.

A form of tubercle infection, which may be considered intermediate to pulmonary tuberculosis and so-called surgical tuberculosis, is pleuritic effusion.

In seven cases of this kind we were able to demonstrate six times a rapid lessening of the quantity of fluid followed by a favorable crisis and a curative diuresis.

There seemed to be no doubt of the efficacy of the serum in these cases. Certain cases of Potts' disease, complicated with fistulæ and abscesses, and in one case by a paralysis of the lower limbs, were completely cured. Glandular tuberculous masses in the neck and in the axilla decreased in size at once and fistulæ, long open, closed definitely within a few days.

In a certain number of cases casefied masses were absorbed without any further intervention. In treating bone tuberculosis when a fistula did not close under the treatment, we were forced to the conclusion that a sequestrum was present, and the operation performed as the result of this diagnosis always confirmed the conclusion.

Out of nearly two thousand injections only three times was there any local reaction. The serum does not produce fever or any form of general

reaction. The hectic fever of tuberculosis promptly disappears after a few injections. It is never a contraindication to its use. We have even deliberately looked for cases of fever in order to demonstrate the antifebrile action of the serum.

Of course, we realize very well that only an experience much larger than that we have been able to secure, and made on a much more extensive plan, will suffice to give a definite judgment as to the value of our serum. Observations are being made with it already in a number of places, and even in foreign countries under the control of competent clinicians. The results so far obtained by others have been quite as encouraging as my own. When added to those obtained by us here in the laboratory, with regard to animals, and in the hospitals of Paris with regard to patients suffering from tuberculosis, they certainly justify us in thinking that we are in possession of a valuable remedy for tuberculosis, which deserves the attention of the medical profession.

PARIS, FRANCE

Ghosts of Dead Days

BY H. STILES BRADLEY

AWAY in the valley of sorrow,
In the shade of the hill of despair,
My treasure of light is entombed in the night—
The graves of my dead days are there.

Mournful and solemn and somber,
Swept over by grief-laden sighs,
And drenched by the tears of the god of the
years,
My promise of usefulness lies.

Above, gaunt and grim, sit the specters
Of life-plans and purposes fair,
Of hopes that were born in the flush of the
morn—
They creep from the sepulchers there.

I try, but can never escape them,
For e'en when I hurry away
They follow my feet through the cottage and
street,
In the dark and in glare of the day.

They pierce my lean soul with their glances
From sockets of skulls without eyes.
I shiver to find that the moan of the wind
Is the pitiful sob of their cries.

O days that I murdered in waiting!
O chances to work and to win!
I gladly would die, if with you I could lie.
Forgotten of God and of men.

But linkéd together forever
Your ghosts and my mem'ry shall go.
In darkness outside my poor soul shall abide.
And weep for the dead long ago.

ATLANTA, GA.

Literature

Comte's Philosophy

THE American students who have ever taken pains to make themselves intimately familiar with the system of Comte are probably comparatively few. We doubt, indeed, if there is another great system maker, naturally ranking with the foremost thinkers, who is so little studied by Americans. As yet there exists, so far as we know, no translation of his entire philosophy. The abridged translation made by Harriet Martineau, making about one-fifth the bulk of his great *Cours*, has been the only accessible source to those who did not have at hand the original work, or might not be able to read it in the French. The present translation of the exposition* of M. Levy-Bruhl may, therefore, be of wider service than anything else available as a means of making English and American students acquainted with the thinking of the great founder of Positivism. It is a far better work for this purpose than the Martineau abridgement, partly because the author states Comte's philosophy more clearly than he stated it himself, and partly because it is done in a compass small enough to be of value to many who would not think it in the least useful to go through with the vast bulk of the original, or even the still formidable English translation.

The unessential criticisms upon Comte are disposed of, and the mind of the student is considerably clarified by the exposition of three points as to which considerable misunderstanding existed. So acute a student as Herbert Spencer criticised Comte for his classification of the sciences; a supposed contradiction between Comte's philosophy and his "Polity" has often been noted; and, from want of understanding of the sense in which he used his terms "theological," "metaphysical" and "positive," frequent misdirected attacks have been attempted.

* THE PHILOSOPHY OF AUGUSTE COMTE. By L. Levy-Bruhl. Authorized Translation by Kathleen de Beaumont-Klein, to which is prefixed an Introduction by Frederic Harrison. New York: G. P. Putnam's Sons.

By "theological" Comte merely meant (says our author) the habit of attributing the movements and changes of the cosmos to "wills like ours." By "metaphysical" he meant only to indicate the philosophical method that posits "entities" as the cause of phenomena. By "positive" he describes his own proposed method of dealing with actually known facts and laws, and nothing beyond them. As to the contradiction alleged between the "Philosophy" and the "Polity," the author seems to establish a defense for Comte by pointing out that the "Polity" was propounded as a result of the "Philosophy" before either of them was begun; and that the entire classification of sciences worked toward "Humanity" as the goal of the system. In the matter of this classification, M. Levy-Bruhl corrects Spencer by showing that he criticised Comte for not doing that which he never meant to do. The classification was not intended as an orderly arrangement for every purpose, but as a "hierarchy" for Comte's special system. The principle in it is that of *dépendance*; the most general science mathematics, for instance, being chosen first because all other sciences depend on it, while it might conceivably stand alone without dependence on any. By carefully stating these corrections, the author has cleared the field for the critic to deal with the actual intents of Comte.

It is not within the province of the reviewer of this book to enter upon a criticism of the philosophy itself. It may, however, be said in passing that in making the system clear this book has not made the philosophy any more practicable or acceptable. The criticisms that have destroyed it as a vital force, both in England and in Germany, remain in mastery of the field. In the work, however, of giving a clear and comprehensive exposition of Comte's philosophy this author has accomplished a task that leaves very little to be desired. He does not speak as an advocate, tho he shows clearly that he belongs in the ranks of the

positivist philosophers. All the better is this, as determining that we should not only have a sympathetic interpretation, but that the system will be stated at its best. It need not be of concern to the reader that the great system as such is long ago obsolete. The attempts of so great a mind as Mr. Frederic Harrison have not given it any popularity in England, and in America it never had any respectable following. As a religious cult it would never have mustered a congregation anywhere large enough to escape the witty description of one of its London assemblies: "A religion of three persons and no God." Nothing has established itself out of the system that was not common to human speculation. But even in our day, when one searches vainly for so much as a "residuum," the study of this system would have considerable value, if only as showing how a wooden theory of the world could marshal into order under its generalizations the entire sum of phenomena and the whole complexity of the cosmos.

The translation of the work is by Kathleen de Beaumont-Klein, who has some doubtful English that makes one suspect that she knows her French better. One of the persistent errors is the use of "to" in place of "for" after the verb "substitute," which does not read like the error of one born to the English tongue. There are a few misprints.

General Gordon's Reminiscences

A MILITARY man can hardly be expected, perhaps, to know the dangers of a preface as the man of letters should. General Gordon's book,* taken for what it is, must escape much criticism which its prefatory pretensions invite. It is not a "condensed" review of that most heroic era, nor is it a contribution to a future history, for its contents are with few exceptions not of the character upon which the scientific historian relies. As light reading upon Civil War subjects it is to be recommended. From Manassas to Appomattox the author has linked together one anecdote after another, varying the monotony with florid descriptions

of battles and eulogies upon military commanders. Where General Gordon has taken part in the action himself our knowledge of the events is increased, but the gain is doubtful, because we are nowhere told whether these reminiscences are memories of events 40 years removed or extracts from his contemporary papers and diaries. There is a pervading spirit of fairness to the opposing cause as well as its defenders. The war, General Gordon holds, was the struggle of "liberty as embodied in the sovereignty of the States against liberty as embodied in the perpetuity of the Union." The statement in the first chapter of the real causes of the Civil War is fair and broad in its view. Slavery, the writer declares, was far from being the sole cause of the conflict. There were economic causes at work compelling the people of the two sections to embrace opposing political theories, the South holding that the individual States were sovereign and that the Constitution gave no authority to the central Government to invade and coerce a sovereign State; the North maintaining that sovereignty was a unit and could not be divided, and that the right of self-preservation was inherent in all governments. Neither side was "wholly and eternally wrong." Finally, when argument could no further go, brave men on both sides "struggled and died for the right as God gave them to see the right."

It is unfortunate that General Gordon's interesting book should be marred by old fashioned, gorgeous rhetoric and a weakness for classic allusions of doubtful force. The "intrepid" this and the "dashing" that are ever in "furious combat" with the "gallant" somebody leading the "fiery brigades" amidst the "harrowing pandemonium" and the "whirling currents" of "relentless carnage." The ironshod and pitiless horses make the plain quiver with their furious tread. A thousand sabres leap from the scabbards and glisten in the burnished sun, while the horses chafe their restraining bits, and their nostrils dilate and their flanks swell in sympathetic impulse. The guns cool their heated throats, and then pour hot, grape-like, burning lava from volcanic vents. The ruthless Harvester continues to pile up his heaps of slain, until, at last, to our intense relief, the

* REMINISCENCES OF THE CIVIL WAR. By General John B. Gordon, of the Confederate Army. New York: Charles Scribner's Sons.

"embattled hosts sleep upon their arms." It is an abuse of terms to call such bombast fine writing; it is nearer allied to fireworks. We feel as if we were reading in Pope's translation of the "Iliad" of one of those encounters which shook Olympus.

General Gordon's spirit of charity is almost immodest. He rather seems overanxious to spread the "mantle of oblivion" over all the faults and errors of leaders on both sides. He has a eulogy for each of the Federal commanders except Halleck. A high tribute is paid to General Rosencrans, and in several places he takes up the cudgels in his defense with convincing effect. An amiable fault of the whole book is, however, that too many "mighty anthems of praise rise to heaven"—to use the general's own language.

At Gettysburg, and again in the battle of the Wilderness, General Gordon tells us that he suggested a plan of action which, had it been adopted, would have resulted in a "crushing defeat" to the Federal army, and the consequent triumph of the Confederate cause. In the Shenandoah Valley he was the hero of a "hair-breadth 'scape," by means of a leap over a precipice, which casts quite in the shade the mythical adventure of Putnam.

On the whole, General Gordon has given us a soldier's book rather than that of a military authority or critic. From his pages, full of presentiment and fatalism, abounding in war anecdotes, pathetic and funny, one may get homeopathic doses of the Civil War history. There is little weightier than a eulogy, or deeper than military sentimentality.

Cæsar's Portraits

THIS volume* purports to be the result of a critical study of "every marble or

* PORTRAITURES OF JULIUS CÆSAR: A MONOGRAPH. By Frank Jesup Scott. New York: Longmans, Green & Co. Price, \$5.00 net.

GENERAL JOHN B. GORDON

Author of "Reminiscences of the Civil War." Copyright, 1903, by Charles Scribner's Sons.

bronze that could be found assuming to be" Julius Cæsar, and through its illustrations to afford the reader opportunity for his own comparisons and deductions. It contains 37 full-page plates and 47 smaller figures in the descriptive text.

Of course, the greater part of all this material is conjectural. No statue or bust of Cæsar has been identified as contemporary with him, still less as an actual portrait from life. Even the coins known to have been issued during his domination bear profiles so various and so crude that any idea of intended likeness is quickly dispelled. Nor has the present author made any certain discovery. What he has attempted to do is to recognize characteristic or "Cæsar" lineaments in a number of heads—some currently supposed to represent Cæsar, and others unknown, and so to construct by a selective process a typical, if not the real Cæsar. The result he embodies in two ideal heads respectively purporting to repre-

sent Cæsar on the day of his assassination and at the age of 26, which apparently insist that the conqueror of Gaul died a weak minded valetudinarian after time had changed him from a sophomorical prig.

This, being largely a matter of taste and idealization, should not detract from whatever credit is due to the industrious collector of all plastic semblances of Cæsar into the handy confines of one volume, provided he has put his material in shape for intelligent study. Unfortunately this has not been done. There are photographs of original marbles and bronzes, photographs of plaster casts, photographs of copies of all shapes and sizes interspersed with the crudest sort of free hand sketches. There are descriptions of portraits which have been seen, descriptions of portraits which have not been seen, descriptions of portraits which other people would not permit to be seen and descriptions copied from somebody else. To make comparisons in any logical way is impossible. As for evidence of authenticity, the author seems to have little conception of what it is. Guess work seems to him as good as verification, and sometimes this gets grotesque, as, for example, when he argues that a much dilapidated physiognomy was made by a sculptor "copying a death mask by the eye in marble." There is not a scintilla of proof that any death mask was ever made of Cæsar, nor any explanation why any sculptor, ancient or modern, should ever be moved to reproduce one in marble *fac-simile*.

The author has tried to examine—with varying success—the sixty busts and statues already classified by Bernoulli in his *Römische Iconographie*. He adds twenty-four numbers to the German list, but on analysis it turns out that nearly all of these are hopelessly uncertain both as to subject and period of execution, while some are taken merely as hearsay.

The standard portrait of Cæsar is the head and neck now in the British Museum. The present compiler prefers the bust in the Chiaramonti Gallery of the Vatican, and notes with approval another head which he claims to have found "almost by accident" in the Tesoria of the Pitti Palace, but which lacks, as usual, identifying proof. The volume

contains a lengthy biographical sketch of Cæsar—largely in accord with Mr. Froude—and omits the many well known verbal descriptions of his personality.

Christopher Columbus

THIS new volume on the life of Christopher Columbus* is very much like the first—valuable for the original material that it contains, but offering no new contribution to the subject. The major portion of the seven hundred pages is given up to the discussion and reproduction of documents concerning Columbus and his discoveries. The author's own matter shows him benevolent and pious and full of devotion to his task. Sentimentality, rather than scientific zeal, seems to be the motive for writing the book. In the literary execution there is the same rhetoric with the false ring and the same specious platitudes as in the former volume. There is a strange mixture of the most prolonged and wearisome argument, with a journalistic fondness for matters of human interest, such as Columbus's fear of the loss of his discovery by shipwreck before the return to Spain. Upon the feelings of Columbus and upon other mere trifles the author dwells long and unctuously, because these things have an interest for him, tho often they do not explain his hero or further the narrative. He moralizes long on Columbus chained, and extracts every drop of sentiment to be gotten from that melancholy incident. Finally, there is a vast amount of romantic adventure told with all the credulity of contemporary chroniclers. Mr. Thacher takes their stories with little or none of the critical analysis needed to get the grain of truth that they may contain. In fine, the book is neither the one thing nor the other, neither popular nor scientific.

Two "parts" of the whole treatment are given in this volume. The first of these is entitled "The Announcement." It contains a pretentiously critical essay upon the first publication of the discovery, the spreading of the news, and the question of the title to the new Indies.

* CHRISTOPHER COLUMBUS: HIS LIFE, HIS WORK, HIS REMAINS, AS REVEALED BY ORIGINAL PRINTED AND MSS. RECORDS. . . . By John Boyd Thacher. Vol II. New York: G. P. Putnam's Sons.

The four papal bulls receive a chapter each, as does also the treaty of Tordesillas. The second part is called "The Exploration," wherein the second voyage and the letters concerning it are discussed. There is an elaborate apology for Columbus's instrumentality in the enslaving of the natives of the newly discovered islands. The attempt to explore Cuba, and the subjugation of Española get a chapter

other continent—a new world, not Cathay.

The real value of the book lies in the maps, the reproduced and translated manuscripts, and the fine portraits and coats-of-arms. The frontispiece is a colored full-page reproduction of the coat-of-arms as adopted by Columbus in January, 1502. Three other fine plates show other armorial bearings used by

CHRISTOPHER COLUMBUS

Muñoz Portrait

each. After the narrative of the third voyage, the bringing Columbus home in chains is told, and a long and interesting letter, written by Columbus to the nurse of Prince John of Castile, tells very pathetically of his misfortunes. Much space is also given to the "Libretto," the first collection of the voyages ever printed. The print is reproduced in *fac-simile*, and, with the translation, occupies 57 pages. After the description of the fourth voyage, there is a chapter entitled "Another Sea," in which Mr. Thacher still clings to his vagary about Columbus being aware that he had discovered an-

Columbus or his family. Some of the *fac-similes* of ancient maps are the best reproductions accessible. In general, it must be said that the printer has given to the book the chief value that it has. Mr. Thacher has very assiduously collected a vast amount of valuable material and in this has served the newer libraries, which cannot get the older books.

Cherry. By Booth Tarkington. New York: Harper & Bros., \$1.25.

There is native wit, which may be of the coal-hod variety; and there is wit

by rote, a smartness acquired with practice; but humor, that iridescence of the mind which edges every thought with a smile, is an element of genius. It is something more than mere wit, a sort of candle-lit gift of the gods, and rarely bestowed. Booth Tarkington has it. Without any especial creative ability, he understands the humor of interpreting certain types who have no sense of humor themselves. Thus "Sudgeberry," the spokesman in this charming comedy, is a veritable young Bottom, with no suspicion as to the length of his own ears. He is the victim of a precocious dullness and the effect of his homilies upon a pretty maid, her choleric old father and a delightful lover, proves the author's ability to show others as they do not see themselves. And the demonstration is too delicately done to be called a vulgar caricature. The selfishness, egotism and cowardice of the "Sudgeberry" type is so adroitly dramatized by the incidents set down that every reader will recognize some young Erasmus of his acquaintance who persecutes society with the desire to improve each shining hour. Doubtless such people have their vocation, as Mr. Tarkington points out in the initial chapter; but they can always be relied upon to miss the real point in life from first to last. They lack a sense, that telepathy of nature which insures and guides us among our kind. And it is a pity that all the erudite bores in this country could not be furnished with a copy of this faithful portrayal of their rôle.

American Bookbindings in the Library of Henry William Poor. Described by Henri Pène du Bois. Illustrated in gold leaf and colors, by Edward Bierstadt. Printed at the Marion Press, Jamaica, Queensborough, New York. Published by George D. Smith. \$25.00.

It was an excellent idea to describe and picture some of the books and bindings in such a library as that belonging to Henry W. Poor. The library units are largely first editions of American authors, special editions of works valued highly by American book buyers. The text is after the familiar style of Henri Pène du Bois, pleasant, chatty, but with a tendency to wander away into bookish matters that are not always relevant. The

real value of the present volume lies, it would seem, in the typographic and splendid illustrative effects. The recent book on *Bookbinders and Their Craft* (Prideaux) was a fine example of book-making, but the volume now available is superior even to it, both as to the results secured by the printer and the illustrator. The Bierstadt plates are superb, and bring out most satisfactorily the very texture as well as the colors of the Levant morocco that has been used in binding and in mosaic. Among the binders whose work has been reproduced in the book are J. B. Nicholson, R. W. Smith, the Club Bindery, Curtis Walters, William Matthews, Alfred Matthews, Stikeman, Otto Zahn (Toof & Co.), and Ralph Randolph Adams.

The Strife of the Sea. By T. Jenkins Hains. New York: The Baker Taylor Co.

Mr. Hains's stories have to do with sea birds and fish humanized—if one may use the term—somewhat, tho not exactly, after the fashion in which Messrs Thompson Seton and Long deal with wild animals ashore. He has an advantage over his brother authors in that there is probably no marine John Burroughs to dispute his accuracy—and it goes without saying that albigores and pelicans being far more strange and outlandish than rabbits and crows, the field for romance concerning them becomes proportionately both wider and safer. Some of the tales here collected were contributed originally to *THE INDEPENDENT*, so that their quality is well known. Mr. Hains's wild creatures are far less subjective than those of either Seton or Long—and he makes no effort to impress one with the notion that they really have human attributes. On the contrary, he reveals them in all the savagery of the endless struggle for existence—and sometimes goes to perilous extremes in showing the tragic side of it. His skill is best exhibited in the constant suggestion that instinct and not reason is the impelling force. His brutes never think, and there is none of that transplanting into them of abnormal intelligence, which, however much it may be justified by exceptional cases of precocity, always gives the story a ring of

exaggeration if not of untruth to nature. Mr. Hains has a still greater advantage over his compeers in his ability to write sea pictures—and, therefore, his *mise-en-scène* is easily the best of any which the Nature authors have furnished. He knows how waves look in a storm—not only as the sailor sees them, but as the fish sees them—and with equal felicity he can paint the tranquil reaches of the Gulf on a hot day, from the view point of a sleepy pelican, in a manner which carries conviction to the reader and would undoubtedly do so likewise to the pelican if it could read. Eleven stories are contained in the present collection. Their merit is somewhat uneven, and whether it was worth while to justify the title by risking a general effect of tragic sameness is questionable. They are all interesting, however, not only in themselves, but as suggesting far more important work—for it seems to us that there is no writer of fiction on this side of the Atlantic who has so adequate an equipment for producing good sea novels as that which Mr. Hains, not only in these tales, but in his other writings, has amply shown himself to possess.

Poets and Dreamers: Studies and Translations from the Irish. By Lady Gregory. New York: Charles Scribner's Sons, \$1.50 net.

Lady Gregory's "Cuchulain of Muirthemne," a translation and arrangement of the old heroic Irish stories into something approaching epic form, was one of the notable books of recent years—was indeed, to speak without any exaggeration of judgment, one of the notable books of the world. The present volume is altogether slighter in substance, and in parts yields to that laxness of style and thought which is the curse of the so-called Gaelic revival. Decidedly the most interesting chapter of the book is that entitled "Raftery," which portrays to the life a famous blind bard well known in Ireland a hundred years ago, and not forgotten to-day among the peasant folk of the land. Indeed, the gist of Lady Gregory's chapter is a record of the anecdotes and poems which she has collected among the ignorant country people where such memories are most strong to linger. Not less vivid to-day is the

memory of poor Mary Hynes, whose beauty was accounted the most wonderful in all Ireland, and whose fame was scattered over the land by the blind, wandering minstrel:

"There was no part of Ireland I did not travel: from the rivers to the tops of the mountains, to the edge of Lough Greine, whose mouth is hidden; but I saw no beauty but was behind hers.

"Her hair was shining, and her brows were shining, too; her face was like herself, her mouth pleasant and sweet. She is the pride, and I give her the branch. She is the shining flower of Ballylee."

Odd Craft. By W. W. Jacobs. New York: Charles Scribner's Sons, \$1.50.

We are informed on presumably good authority that Mr. Jacobs "does not write about sailors, but about barge-men;" so it will be well for those readers who have delighted in this popular author's books to correct their mistaken impressions, and keeping in mind the indicated distinction, not to say difference, take up *Odd Craft*, his latest collection of salt-water yarns, with a readjusted standard of comparison. Whether or no they will be in a position to apply any standard of comparison at all, once they have fallen under the spell of the writer's humor, is a question one must leave those to decide who found *In Sunwich Port* irresistible, and who will discover this book to be no less so.

Eleanor Dayton. By Nathaniel Stephenson. New York: John Lane, \$1.50.

This novel reminds us of another and far better book by the same author, "The Beautiful Mrs. Moulton." But Mr. Stephenson is like the minister who changed his text indeed, but never the real substance of his sermon. *Eleanor Dayton* is an interesting American girl, who gets her portrait painted by a famous artist, even as did Mrs. Moulton, and who appears in a Frenchman's studio where her own picture is being exhibited. And to the careful reader it is apparent that she is made over from Mrs. Moulton's graceful sweeps and curves. There is nothing original in the story, much that is superficial, and a certain cleverness which comes from practice rather than inspira-

tion. The historical figures, such as Napoleon III, are dragged in, and do not add anything to the situation. The fact is, Mr. Stephenson should avoid historical features in his novels. He manages the Cincinnati atmosphere of romance very well, where interest depends upon a rise in the price of wheat and the heroine's taste in clothes.

Literary Notes

"MISERY loves company, but company does not reciprocate." "Sweet are the uses of diversity." If you like revised proverbs like these, with the scorpion's sting turned in an unexpected direction, you will find one for each week in the coming year in the "Cynic's Calendar." (Paul Elder & Co., San Francisco. 75 cents.)

....A "pocket Spencer" is a daring attempt, for there are few authors whom short miscellaneous selections would less adequately represent. Still, there are probably many persons who would not think of taking down from the shelves a volume of the "Synthetic Philosophy" who will read the extracts from his earlier writings, published by H. M. Coldwell & Co., Boston (flexible calf, \$1.00), and will realize from them that he is not too deep and dull for the average reader.

....Perhaps no more important book on Oriental studies has, since Robinson's "Researches," been published in this country than the translation and commentary on "The Code of Hammurabi," in two volumes, soon to be issued from the Chicago University Press. The first volume contains the Cuneiform text, transliteration, glossary and philological and historical notes, by Prof. R. F. Harper, while the second volume, to appear later, by President Harper, compares the Babylonian with the Mosaic legislation. We understand that the entire work, which is more complete than anything on the subject published abroad, has had the full collaboration of several other competent Assyriologists in University of Chicago.

Pebbles

[In accordance with our yearly custom we reprint in our Pebble columns this week the latest "Little Willie" poems culled from the college funny papers. This brand of humor (?) still holds with undiminished tenacity its last year's popularity.—EDITOR.]

Pray for the soul of William De Grey—
On this baby's ma he was calling one day;
He was told that the kid was the image of him,
So he jumped in the river and forgot to swim.

—*Princeton Tiger*.

Annie, washing dishes once,
Tumbled down the sink.
Mother with a big bent pin
Fished her out—just think.

—*Columbia Jester*.

Willy, while the ice was thin,
Tried to skate, and he fell in.
Willy tasted rather nice,
When they cut the pond for ice.
—*University of Michigan Wrinkle*.

Sidney tumbled from the tower
At twenty minutes past the hour.
He had to cut his recitation,
Because he'd spilled his education.
Now everybody hopes the rains
Will clean up Sidney's scattered brains.
—*Cornell Widow*.

Alphonse threw a rock at Fred
And struck him squarely on the head.
Mother saw the circumstance
And smacked Alphonse upon the pants.
—*Harvard Lampoon*.

SWINGING.

Little John is quite a hero,
But he's bad, oh dear, oh dear! Oh!
Hit his teacher on the head,
(Dear, kind teacher now is dead)
Just to get a holiday
So he could go out and play.

Grown up John now has no fear. No!
Tho his end is near, so near, Oh!
Youthful habits led him to
Kill a man each day or two.
'Tis next week he's going to swing
For his wicked slaughtering.

Moral:

Children who their teachers kill
Always keep on killing still,
So do not kill your teachers, dears,
Till you are of maturer years.
—*University of Pennsylvania Punch Bowl*.

WILLIE EST MORT. VIVE WILLIE.

Willie poached his baby sister
O'er the kitchen range.
Mother said, before they missed her:
"My, this room smells strange!"
Will put a funnel down baby's throat
And poured in water to watch him float.
Baby busted on the floor,
And as for Ma, she almost swore.

While Willie's Pa was in a doze,
Will put a leech right on his nose.
Soon dear Pa was sucked quite flat,
But Mother wouldn't stand for that.

Willie lingered near the blast—
Couldn't leg it very fast.
Everything from toes to trunk
Came down singly, chunk by chunk.
—*Yale Record*.

THE index of THE INDEPENDENT for the year 1903 will be ready in a few days and we shall be glad to send it free to any subscriber who will notify us that he wants a copy.

The "Parsifal" Success

THE unanimous verdict regarding the production of Wagner's "Parsifal" at the Metropolitan Opera House is that it was an unqualified success. Mr. Conried has more than one reason to congratulate himself on this result. Regarding the financial outcome of his bold venture he never had any reason to worry. New York had not enjoyed a Wagnerian *première* since the production of "Rheingold," on January 4th, 1889, and the first performances of the great master's last work would have drawn crowded houses even if it had been presented inadequately. But if he had failed to produce it in a manner approximating in excellence the Bayreuth performances, he would have been subjected to well-merited criticism and rebuke. The only rational ground Wagner had for wishing "Parsifal" to be given at Bayreuth and nowhere else was that sad and numerous experiences had led him to believe that in the ordinary opera houses sufficient attention would not be given to all the minute scenic and musical details which are essential to the success of this imaginative and elaborate work. But if he could have been at the Metropolitan Opera House on the evening of December 24th, and noted with what scrupulous care and noble disregard of cost Mr. Conried had carried out all his directions and intentions, he would have been the first to applaud the transplanting of his work to American soil. Of this there can be little doubt, for in his heart of hearts, he, like all men of genius, of course, wished his creations to be enjoyed by as many persons in as many

parts of the world as possible. Mr. Conried, therefore, instead of being a vandal and an irreverent disregarder of Wagner's wishes, has proved himself his best friend, and a friend of the genuine Wagnerites. The tumultuous applause with which he was received when, in response to vociferous calls, he appeared before the curtain after the second act, left no doubt on that point.

Two more things, however, were to be considered. Would a New York audience assume the attitude proper toward a work so solemn and, in part, semi-religious; and would it be possible to create the "Bayreuth atmosphere" in the Broadway opera house? A few days before the first performance here, a society of long-haired and short-witted Wagnerites in Germany passed a resolution, the substance of which was that to produce "Parsifal" in New York would be to cast a big pearl before swine. These silly fellows may be pardoned, for they had no means of knowing that New York has as many devoted and intelligent Wagner-lovers as any German capital. They would have been astounded if they could have observed the altitude of last Thursday's audience. It was supposed that while the body of the house would be filled at 5 o'clock, the boxes, the haunts of society leaders, would hardly see their occupants till after the long intermission. But even the boxes were filled promptly, and throughout the evening the whole audience was as silent and behaved as decorously as any church congregation. It was, moreover, an astonishingly Wagnerian audience. On an occasion like this one might have supposed that most of the \$10 tickets would fall into the hands of wealthy curiosity-seekers, eager to witness a performance which the newspapers had quite properly designated as the most important event in the history of music in America. But the devotees anticipated them and got most of the seats. They regulated the etiquette of the occasion, allowing no interruption of the music by ill-timed

applause, and listening with rapt attention.

Applause, too, was discountenance; where Wagner himself had discounted it—at the solemn close of the first and third acts—while the singers and the others concerned had their “innings” after the purely secular second act.

Such an attitude on the part of the audience is in itself a part of the “Bayreuth atmosphere.” To be sure, Mr. Conried could not transform the region about Broadway and Fortieth Street into a hill overlooking the ozoniferous Franconian Switzerland; he could not build a new theater specially suited, like a tailor-made garment, to Wagner’s operas, altho he did the next best thing by rebuilding the stage; he could not impart a vacation mood and produce an opera before an audience with brains untired by a day’s work. But he did things more important than these. He secured the best available artists—artists who had for the most part appeared in the same *rôles* at Bayreuth itself, while others, for the sake of a perfect ensemble, were willing, with Teutonic sincerity and devotion to their art, to assume minor *rôles*, which the singers of most nationalities would consider beneath their dignity.

“Parsifal” is a much-needed addition to our limited operatic repertory, which it would have been a pity to have confined any longer to Bayreuth. It has received an unprecedented amount of free advertising, which will greatly increase Mme. Wagner’s emoluments at next summer’s festival. In New York it will, doubtless, for some years, be looked on as a thing apart, to be given under such special conditions as prevailed this winter. It might also be given on Saturday afternoons, beginning at twelve. Should it ever be incorporated in the regular evening repertory it will be necessary, as in the case of “*Götterdämmerung*,” to curtail it somewhat, since the music itself, not counting the intermissions, lasts within ten minutes of four hours. That it seems much shorter to the interested listener constitutes the best proof of its originality, grandeur and overwhelming emotional power.

The Approachment of Church and Theater

HISTORICALLY the theater is an outgrowth of the Church. Dramatic representations developed out of religious ceremonial. In Greek literature both tragedy and comedy can be traced back to the processions in the worship of Dionysus, and a similar evolution took place in the drama of India. By easy stages the plays descended from Mount Olympus into the lowlands. Faust with its prolog in heaven and its ending in a prison cell is the drama of dramas. The myth, the epic and the problem play mark the line of descent. First, gods alone were the actors, then heroes were introduced and later ordinary mortals appeared on the scene, until finally we have the modern play in which there are neither gods nor heroes, and where the line of footlights faintly draws an arbitrary distinction between actors and audience. The substitution of a mirror for the drop curtain is the only step that remains to be taken to complete the triumph of realism. Having so nearly approached the limits of its arc, the pendulum is already beginning its backward swing.

In the Middle Ages, when all things sprang again from the root, it was the Church which revived the drama for the purpose of teaching scriptural truth and moral lessons, and in the miracle play represented scenes from the Old and New Testaments, and in the morality play personified the virtues and vices and showed them in their true colors. “High Heaven’s Hall” occupied the gallery and “Hell’s Mouth” yawned beneath. In the convent account book we find such entries as

“Paid for 1 lb. of hemp to mend the
angels’ heads.....4d.
Paid for ½ cord of wood for hell-fire...5d.”

The eyes of theatergoers naturally turn downward and it is easier to play bad parts successfully than good, so the antics of the imps proved more interesting than the songs of the angels, and in time the empyrean disappeared unnoticed. In this secularization of the drama the devil, by a curious but very natural process, developed, not into the “heavy villain,” as might have been ex-

pected, but into the "low comedian." So it is literally true, as our puritanic ancestors used to say, that the devil is the father of a large part of our most popular plays.

As everybody knows, the miracle play never entirely became extinct, but was kept up as a religious rite in several remote villages, like Oberammergau, until recently it has come again into fashion and increasingly strong efforts are being made to revive it in other places in spite of the opposition of many people. The surprising interest taken in the recent reproduction in this country of the old morality play of "Everyman" proves there is an unmistakable popular demand for plays of a didactic and religious nature. "Parsifal" is simply a medieval morality play with the most sumptuous of stage settings and incomparable music. The mystery or miracle play deals with scriptural events, or the legends of saints, but in "Parsifal" there are no historical or biblical characters introduced. The *dramatis personæ* are merely lay figures clothed with the garb of certain moral qualities, such as Innocence, Concupiscence, Fidelity and Holiness, while the music itself almost personifies "*Mitleid's höchste Kraft und reinsten Wissens Macht.*"

The lessons dramatized in "Parsifal," such as the power of pity, repression of the lusts of the flesh, and purification through suffering, are pre-eminently Christian and could not be represented to the eye and mind except by means of Christian symbolism. It may, as some say, be improper, or, as others say, impossible to put successfully such moral allegories on the stage, but if it is done it must be done in the language of Christianity, for in no other language can such mysteries be adequately presented. The scenes and symbols of "Parsifal" are rather from Christian mythology than from the Gospels, from the legends of the Holy Grail, which have long been the common property of writer and painter, and which have reached their highest expression in the poems of Tennyson and the frescoes of Abbey. From the simple supper of the twelve in the upper chamber to the ceremonial of the mass as celebrated by the Knights of the Sangreal, there lie the poetic and pious ac-

cretions of fifteen centuries of ecclesiasticism.

It is only twenty-three years since an American publishing house introduced to the public, in an extremely deprecatory manner, a novel of the time of Christ, but "Ben Hur" was resented by only the strictest of the orthodox, and when General Wallace was induced to give his reluctant consent to its being put on the stage, it was patronized by thousands whose consciences had never permitted them to enter a theater before. How much of its popularity is due to its religious lessons and how much to the excitement of seeing a chariot race on a treadmill cannot be determined.

In Europe, the greatest of modern dramatists have taken up gospel themes. E. Rostand, before he had acquired his fame from "Cyrano" and "L'Aiglon," wrote "La Samaritaine," a poetical drama in which the part of the Samaritan woman at the well was felicitously given to Sarah Bernhardt.

In Germany, Hermann Sudermann marked his transition from the society play to the allegorical by "Johannes," a realistic drama of the time of Christ, and the veteran novelist, Paul Heyse, soon followed with "Maria von Magdala." Both these plays were given the conventional motive, that of romantic love, which we nowadays consider indispensable in drama and fiction. In the first, John's head on a charger is demanded by Salome, whose pride he humiliated by repelling her enticements, and in the second the plot turns upon the two lovers of Mary Magdalen, Judas and Flavius, a Roman officer. In both, however, the higher type of love preached by Christ is the dominant principle, softening the anger of John and preserving the purity of Mary, altho Jesus does not appear upon the scene in either.

Almost as marked as this tendency of the theater to undertake to some extent the functions of the Church, by teaching moral and religious truth, is the trend of the Church to add to the appeal to the ear a more or less spectacular appeal to the eye. Almost all sects are becoming more ritualistic and some of the stiffest of Protestant Churches are adopting costumed choirs and processionings, with antiphonal recitation and singing.

In the high churches the ceremonial has reached about that stage in the evolution of sacred drama attained in Greece in the sixth century B. C., just before the golden age of Æschylus and Sophocles, when the plays were mostly given by choruses, with slight action, little recitative and only rudimentary personification, and in which women and professional singers were only sparingly admitted.

We have here intended merely to call attention to certain movements of the time and we do not feel competent to prophesy what will be their future development, whether the Church will develop its own religious plays or whether the Church and theater are to come together after their long divorce. Nor can we now discuss the important question of whether dramatists and actors as a class are qualified by education and training to be intrusted with the teaching of morality and theology. So far only great dramatists have used scriptural themes and they have handled them with a certain reserve and delicacy, but if they become more common, as they seem likely to, they will undoubtedly suffer from vulgar treatment at the hands of ordinary playwrights and inferior actors. We have not been behind the scenes at the representations of any of the biblical dramas, but we doubt if the actors there behave any more reverently than does a church choir rehearsing an oratorio.

Mr. Hanna and Mr. Heath

WE do not hear that any of the prominent politicians of the Republican party are inquiring as to the effect of the postal fraud disclosures upon the public mind. When we say disclosures, we mean not only the detection and indictment of more than forty thieves, in and out of the Post Office Department, who robbed the Government by petty conspiracies, but also, and chiefly, the evidence of long continued maladministration, of the dulled consciences of auditing officers, of the dishonest interest of certain Congressmen in some of these frauds, and of the favor and protection even now given by prominent representatives of the party to persons whose responsibility for maladministration has been fixed by the of-

ficial reports, but who escape legal punishment by means of the statute of limitations. The President's attitude from the beginning has left nothing to be desired. It deserves and has the approval of all honest Americans. He is not among the prominent Republicans whom we have in mind.

The effect of such disclosures cannot, of course, be exactly measured, but it has sometimes been sufficient to stimulate and invite inquiry. After the star route frauds had been uncovered by investigation, the statute of limitations protected some persons not less guilty than those who were indicted and prosecuted. Then, as now, the Republican National Committee was involved. An impression prevailed that prominent politicians escaped indictment for whom the statute of limitations afforded no shelter. The employment by Mr. Garfield of eminent and earnest Democratic counsel to be associated with Republicans in the prosecution of indicted men was not approved by some influential Republicans, who resembled those others who now complain because Mr. Roosevelt has employed "a mugwump and a Democrat," altho Mr. Bonaparte, we understand, has continuously been a Republican. In Washington, at least, much influence was exerted in behalf of the defendants who were prosecuted there. At their second and final trial they were acquitted. It has recently been asserted that no one was convicted and punished. This is an error. In Pennsylvania, a mere clerk who had been employed by one of those who were commonly called conspirators, and who had given the Government information upon a promise of immunity, was prosecuted, found guilty, and imprisoned. But those offenses differed so widely from the frauds recently disclosed, and the conditions of the environment were so different, that the points of resemblance are not many.

At that time the public suspected, whether justly or not, that the Administration which succeeded Mr. Garfield's, and whose task it was to prosecute the accused men, did not desire, as he had desired, to "cut the ulcer to the bone." So far as the new Attorney-General was concerned, there was no warrant for such a suspicion. No intelligent man has

the slightest doubt as to the purpose and policy of the present Administration. At the end of those prosecutions, twenty years ago, it was plain enough that the effect of the whole affair in national politics, owing to failure in the courts, suspicion as to earnestness of purpose, scandal concerning the action of grand juries, and other causes of complaint, was unfavorable to the Republican party. Undoubtedly it had some weight in the following campaign that ended with the defeat of that party at the polls.

At the present time everybody knows that Beavers, Machen and the other indicted thieves will be prosecuted earnestly and with vigor, and that the President will strive with all his power to keep clean the Department which they disgraced. It is true that Mr. Payne is by no means an ideal Postmaster-General, and that Mr. Roosevelt ought to have the assistance of a better man at the head of the Department; but we are confident that Mr. Payne has learned something since he sneered at the Tulloch charges. It is to be expected that the indicted men, or a majority of them, will not escape punishment. The danger that the Republican party should guard against lies in its treatment of administrative shortcomings which are not before the courts, and of men who have not been indicted.

That danger will increase so long as Perry S. Heath shall be permitted to hold the important office of Secretary of the Republican National Committee, and shall be encouraged by Senator Hanna to retain that office. Mr. Roosevelt represents the conscience, vigor and sturdy honesty of the party. Mr. Hanna represents what is called "the organization," whose conscience sometimes seems to lie dormant. As chairman of the committee, and the party's foremost practical politician, he must be regarded by the public as representing some of the party's characteristics and tendencies. For some time past he has stood before the people as the protector of Heath, whom the entire country regards as a beneficiary of the statute of limitations, and the defender of Rathbone, who disgraced the American people by the offenses for which he was convicted in Cuba.

In this, because of his station now and his successful political leadership in the

recent past, he sins persistently and stubbornly and foolishly against his party. At the election in November next the votes of men who stand on or near the line that separates the great parties may be decisive. So long as the organization leader shall protect Heath in his office and shall induce his associates in the committee to stand with him in thus ignoring or defying the reasonable desire of the President that Heath shall be put out, the independent voter will find himself inquiring whether the prevailing tendencies of the party are those of Roosevelt and Bristow, or those of Hanna and Heath.

Mr. Hanna assumes a heavy responsibility, because, as we have said, of his station and of his political eminence and associations during the last seven or eight years. He not only protects Heath in his place, thereby permitting the inference that he approves what Heath has done and the kind of executive administration which Heath represents, but he also permits him repeatedly to give to the public interviews in which this Secretary of the National Committee seeks to promote the candidacy of his patron (Chairman Hanna) for the Presidency, and in the same breath denounces as "adventurers" and "professional reformers" the honest public officers who have uncovered the postal service frauds! Who are these reformers? Is not Mr. Roosevelt himself the chief of them?

It is the plain duty of Senator Hanna—his duty to the President, his party and himself—to demand the immediate and unconditional resignation of Secretary Heath.

Milton's Manuscript

THE most eager literary relic-hunter could hardly desire a more precious treasure than the manuscript copy of Milton's "Paradise Lost," now offered for sale by Sotheby in London. It is only the first Book of which the manuscript is preserved. The rest has suffered the fate of most authors' manuscripts; but these are the identical sheets that were sold to Samuel Simmons, the bookseller, for the famous ten pounds, the very sheets which bear the imprimatur of the high Anglican clergyman, Thomas Tomkyns, who, as

chaplain to Archbishop Sheldon, performed those duties as Lincenser of Books which were so hateful to the Puritan poet. These eighteen insignificant looking sheets, in the characterless handwriting of Milton's amanuensis—not one of his daughters, for that legend was long ago exploded—are all that remain of the copy that was handed over to Simmons in 1667. He published two editions in Milton's lifetime, the first in ten Books and the second in twelve, and one after his death, and sold the right and the manuscript in 1681 to another bookseller named Aylmer, who transferred them a few years later to the famous publisher, Jacob Tonson. These sheets, with other valuable manuscripts, were passed on from generation to generation until they came to their present owner, who now offers them for sale.

Of their genuineness there is no question. Very interesting are the corrections that appear in these sheets, showing the minute pains that Milton took even with the spelling, as indicated in the errata published with the first edition, where we find "hundreds" corrected to *hunderds*, "blessed" to *blest*, and, in a case where the word is emphatic, "we" to *wee*. The present manuscript shows similar corrections. Thus in the lines 708, 709 the printed text reads:

"As in an organ from one blast of wind
To many a row of pipes the sound-board
breathes."

But the manuscript originally read in the second line, "To many a hundred pipes." This was first corrected to read *hunderd* for "hundred," as in the printed errata mentioned above, and then both were deleted, and the present reading, "to many a row of," was substituted.

Such careful corrections show how particular Milton was with his manuscript, even with its spelling. It must have been carefully read to him, and even spelled out wherever there was any chance of doubt. We may be sure that the present accepted text—barring modern spelling—is just as he wished it. And this shows the absurdity of the contention of the most famous of British classical scholars, Richard Bentley, that Milton's text, owing to the carelessness and worse of his scribes, is most corrupt. There is no more curious existing monu-

ment of the perversity of misdirected literary sharpness than is Bentley's fine quarto edition of the "Paradise Lost," which Jacob Tonson was persuaded to issue in 1732. Said Dr. Bentley in his Preface:

"Our celebrated Author, when he compos'd this Poem, being obnoxious to the Government, poor, friendless, and what is worst of all, blind with a *Gutta Serena*, could only dictate his verses to be writ by another. Whence it necessarily follows, That any errors in Spelling, Pointing, nay, even in whole Words of a like or near Sound in Pronunciation, are not to be charg'd upon the Poet, but on the Amanuensis."

Accordingly such little blunders are "judiciously corrected." But this was not all the blame which the famous editor and emendator of Greek classics put upon the scribe. He says:

"The Friend or Acquaintance, whoever he was, to whom Milton committed his Copy and the Overseeing of the Press, did so vilely execute that Trust, that *Paradise* under his Ignorance and Audaciousness may be said to be *twice lost*."

The publisher he charges with being the sole corrector of the press, so that the first edition was brought out "polluted with such monstrous Faults as are beyond Example in any other printed Book." Dr. Bentley charges even worse—wilful depravation of the text—on the amanuensis or publisher, even to the insertion of lines that Milton never wrote. And these supposed errors are explained and exploited in such notes as we venture to commend to those who delight to ridicule the conclusions of the higher and lower critics of the biblical text.

Thus in the sixth line of Book I Dr. Bentley comes across one of these errors, which he proceeds to correct:

"Sing heavenly Muse, that on the secret top
Of Oreb or of Sinai."

Here our textual critic remarks:

"*Secret Valleys, secret Caves* come frequently in Poetry; but *secret top of a Mountain*, visible several Leagues off, is only met with here. Our Poet dictated it thus, That on the *sacred* top Of Horeb."

He proceeds to show that Horeb could not have been "secret" on account of clouds, inasmuch as this mountain is not cloud-capped. A few lines further on the text reads:

"I thence

Invoke thy aid to my adventurous song,
That with no middle flight intends to soar."

Of course, Milton could not have written "song" here, for a song cannot soar; and so it is corrected to *wing*, and the emendation is defended at amusing length.

The line

"No light, but rather darkness visible"

troubles him. How could "darkness visible" "serve to discover sights of wo"? Accordingly Bentley makes the amazing correction to "but rather a transpicuous gloom." Here is textual criticism run mad. So in other lines "not built" becomes *no butt*; "alchemie," *orichalc*; "nectarous," *ichorous*; "subtle art," *sooty chark*; "is judicious," *unlibidinous*; and "loveliest" becomes *forehead*. But the volume needs reading to appreciate its ludicrous ineptitudes. The precious manuscript now offered for sale is evidence of the care bestowed on the text by the author and of its absolute correctness.

The English letter-writers are greatly in fear that some American golden fleecer will rob them of this treasure. Indeed, it is reported that one of them has offered \$50,000 for it. The Sotheby firm seems to be holding it for offers after a sort of private auction way, for they put no price upon it. We would like to see it purchased for one of our great public libraries, inasmuch as the British Museum has no money to spare, and British millionaires have not learned to make munificent gifts. So let it come here, and we will value it. And yet the question will arise whether the money could not have been better spent. But that was Judas's question.

The Positive Way

A DIFFICULT question of ethics is raised by each fresh revelation of the wickedness that pervades modern business. Whether it be privately conducted business, controlled by corporations, or a great Government business, like the Post Office, there seem always to be underneath the surface things going on that, when brought to light, shock the moral sense of right thinking men. It is not for us to anticipate the findings of the

courts in the shipbuilding case, or to say how far the documents presented by Mr. Bridges in his history of the Carnegie Steel business present a fair picture, or to weigh the morality of those transactions that Miss Tarbell is reporting in her history of the Standard Oil properties in *McClure's Magazine*; but we must admit with shame as American citizens that in all of these cases there has been grave wrong-doing by somebody, and acknowledge that it is exceedingly difficult to dissociate unrighteous conduct from the names of men that are also associated in the public mind with great contributions to the nation's industrial and political prosperity and with munificent benefactions.

The difficult question of ethics is: Are we bound to try to separate the wheat from the tares in all this mixed-up business, and to adopt a stern moral course of discountenancing any acceptance of gifts from tainted sources by institutions or reformatory agencies that are dependent upon private generosity for support; and, in like manner, to discountenance all public men who seem to be even indirectly responsible for gross wrong-doing in the public service? There is good moral precedent for declining to undertake so difficult a work. A moral teacher whose discernment and integrity have never been questioned by sane men has advised that the wheat and the tares be allowed to grow together until the harvest, in the assurance that the tares shall be consumed in due time.

Undoubtedly, it is a necessary service that those zealous persons render who devote themselves to the exposure of evil-doers. We should be sorry if there were not men in the world, and women, too, with a gift for the kind of remorseless following of the wicked that has been displayed by the late Henry D. Lloyd, by Miss Tarbell and by the committee that has brought the Post Office scandal to light. At the same time we feel strongly that it is a great mistake to fix attention altogether upon the negative or retributive measures of dealing with unrighteousness. The history of morals is a somewhat discouraging record of the failure of attempts to make men good by the public exposure of iniquity, supplemented by punitive and repressive meas-

ures. All wrong-doing has its source in general conditions of imperfection, both of human nature and of social organization. Especially is this true of the great wickedness in high places and on a gigantic scale such as has been revealed in modern business and in modern politics. We cannot afford to spend too much time in arraigning individual wrong-doers to the neglect of a patient study of general conditions and of persistent effort to make them better.

There is a growing conviction in the minds of thoughtful students of our industrial organization that we cannot hope to have a perfectly fair and high-minded conduct of business so long as it is possible for the clever and the strong to exploit the great body of their fellow men with so little restriction as they now meet with, and so long as the temptation to exploit is so enormous as it is at present. There seems to be no escape from the practical position that the right of individuals or of corporations to appropriate and monopolize natural resources to any extent, supplemented by the legislation that confers great legal privileges upon corporate bodies, does, in fact, give to the clever a means to levy heavy contributions from both the wage-working and the consuming public. It is more than doubtful whether there can ever be such a thing as industrial fair play until the public ownership and control of these resources is asserted and administered for the good of all, instead of being bestowed in almost unlimited franchise rights upon the few.

We have been very careless, also, about fixing the responsibility of men who undertake to control those accumulations of capital that are made by the contributions of many stockholders. American law is notoriously loose in its dealings with directors. They are permitted to play with great properties without fear of being called to account for their stewardship. There is no hope of bettering this condition so long as the public takes the easy-going view of such matters that now prevails. It would be a wholesome thing if, instead of giving too much attention to the question of personal demerits, we could carry on a general campaign of education to bring about a stricter requirement in regard to trusteeship in general.

It will, of course, be said that the Post Office scandals warn us that an extension of public administration into the field of private business would afford us no assurance of greater honesty, while it might greatly curtail the range of enterprise. The sufficient answer to this objection is that all our standards to-day are set by private business, and that it is the madness to accumulate material fortunes that pervades all our society and creates in the public service, as well as elsewhere, a dissatisfaction with modest gains. A more equal distribution of wealth, consequent upon a public ownership of the great natural resources, would go far to substitute new conceptions of life, which would render us immeasurably more secure against wrong-doing in the public service as well as in the conduct of private business.

Mr. Whitelaw Reid's Prophecy

THIS is Mr. Whitelaw Reid's prophecy in his speech at the New England dinner in this city last week:

"I venture to predict that the time will come within the lives of many who now hear me when the man who shall propose the incorporation as a State into this Government of the United States of America of any island of the sea, the Philippines, the Sandwich Islands, or Porto Rico, or Cuba, will be hunted from political life as a public enemy, whether he be animated merely by lingering reminiscences of the filibusters and the slavery propaganda or whether he represent a sugar trust in Wall Street or a sage brush trust in the United States Senate."

Do we understand what he means? Mr. Reid seems to suggest that any movement for the future admission of the Hawaiian Islands or Porto Rico, or any other outlying dependency of the United States as an equal State of the Union will be selfishly promoted only by such as sympathized with Walker's filibusters or who wished Texas admitted to extend slavery, or who wanted to import free sugar for purposes of trust wealth. What the "sage-brush trust" means is not so clear. Now the desire that our colonies should in time become States does not principally come from a filibuster element, political or commercial. It comes from the other sort of people, from those who believe in human na-

ture, in equal rights, who have trust in the elevation of the race and races, and who believe that Hawaiians and Porto Ricans can become good enough citizens of the United States, and that their wishes and rights are to be considered as well as those of the immediate descendants of the Puritans, the Cavaliers and the white slaves sent out from English prisons to Massachusetts and Virginia.

Mr. Reid's protest against any future political enfranchisement of our colonial possessions is a part of his attack upon the free admission of immigrants to residence and the suffrage. He confesses that we have suffered no great injury thus far from our generous policy, and he is compelled to admit that we have gained great advantage therefrom. We have, he says, been able to assimilate this population thus far, but henceforth we shall hardly be able to do so. Why not? we should like to ask. If the original Anglo-Saxon element has thus far been strengthened by millions of Irish and Germans, and they have become good Americans, why should we not, with their aid, be all the better able to assimilate into a patriotic whole the relatively smaller, even if numerically larger, immigration of the last year or two?

But they are of a different sort, says Mr. Reid. They are Italians, Slavs, Russians, from south and east Europe. What of that? They are no more under the ban of suspicion and obloquy than were the Irish when they first came in an overflowing flood. It was against the Irish that the well named Know-nothing raid was directed in the early fifties. We have got all over that fear and craze now, and so we shall get over this baseless dread of Italians and Hungarians. They are not all we would have them, but so was not the Irish horde. They are ignorant, many of them, but they are diligent, hard working and thrifty. They have the physical and mental material for useful citizenship, and if we cannot teach them our language, our republican principles and our patriotism, then we are degenerate indeed, and need an infusion of fresh and better blood.

When Henry Wilson was Vice-President of the United States with President Grant he sat down one day in the office

of THE INDEPENDENT for half an hour and talked of his anxiety for Massachusetts. He spoke of the multitudes of Irish and Canadian immigrants that were invading his beloved State of Massachusetts. They were replacing, he said, the old New England people who had gone West. They came with no knowledge of the history of the country and no intelligent sympathy with its institutions. He was anxious for Massachusetts. The thing to do, he said, was to develop the school system, to take the children and teach them the traditions of the fathers and the love of the flag, that they might become children of the Pilgrims in spirit if not in blood. Thus talked Henry Wilson, the man who had been bound out as a boy from a Massachusetts poor farm, and had never enjoyed a year's schooling before he was one and twenty.

Henry Wilson's method has succeeded. It will succeed yet. This Mr. Reid doubts. He admits that we have succeeded wonderfully in leavening the lump, but he asks:

"Nevertheless, are you sure that as the lump grows larger the leaven from your relatively diminishing numbers will still hold out? Can the nation deal so much better than Wall Street with huge masses of undigested securities? Or is the time approaching when, instead of continuing, with the amazing success of the past, to assimilate these incongruous and heterogeneous additions to our body politic, we may find that they are beginning to assimilate us?"

Yes, we are sure we can leaven the lump. The number of good and patriotic citizens is not "relatively diminishing." We count the citizens of "foreign parentage," whom he talks about, as on our side, and not against us. We see no more need at present than in the past to "sift our immigration," as Mr. Reid would have us do, or to dread the gathering in of new States, in time, from the Caribbean Sea or the Pacific Ocean, or the ends of the earth, as fast as they can be taught the virtue of self-government. That is what Mr. Taft has been teaching the Filipino people, a lesson which no conquering nation has ever taught before. It is a grand effort we are making, and the process implies the conclusion, complete freedom—within this nation, we hope and expect; if not, without it.

The Agnostic Funeral No assurance of a blessed hope can be expected at an Agnostic funeral. The best is a stoic resignation and resolution, and such was the final word of Mr. Leonard Courtney as the body of Herbert Spencer waited at the door of the crematory. He said, and this is all he could say:

"The brain so full and so powerful has ceased to act. There is no longer any manifestation of consciousness. Can consciousness survive after the organ on which it depended has ceased to be? Is the personality that dwelt in this poor frame to be admitted as in itself indestructible? Or must we acquiesce in its reabsorption in the infinite, the everabiding, the ineffable energy of which it was a passing spark? If indestructible in the future, must it not have been as incapable of coming into existence as it is incapable of ceasing to be? Our master knew not. He could not tell. The last enigma defies our question. The dimensions of the unknown may be reduced through successive ages, but compared with our slender discoveries, estimated at the best, a vastness that remains must ever overawe us. Some fringes of the unknowable may yet prove to be capable of being known, but the great central secret lies beyond our apprehension. Yet two thoughts remain. If the night cometh in which no man can work, we may work while it is day. If we can work, it is somehow within our power to work for what is noble, for what is inspiring, for what is broadening, deepening and strengthening the life of man. We may devote our lives to the service of supreme goodness. Looking back on the years of Spencer we may say that he thus worked, he thus dedicated himself as truly and as bravely as any man enjoying the solace of a more definite creed."

This is something. It gives an easy conscience and some self-approval in the retrospect, if it cannot pierce through the fog into the future. Stoicism has the grandeur of a glacier; it cannot have the warmth of Christianity; nor can the glacier attract and support the population of the warm south.

Successful Women of America

"Who's Who in America" is an unfailing mine for writers of statistical articles on the conditions of success, the value of education and the like, altho it is uncertain whether figures so obtained will bear all the weight of argument put upon them, since the wisdom of the method used by the publishers

in the selection of names is much questioned, especially by those who do not find themselves included. The latest delver in this quarry is Amanda Carolyn Northrop, who finds "that one woman has attained distinction to 12 men; that 54 per cent. of these are married; 69 per cent. refused to give their ages or their reasons for not giving them; that only 15.5 per cent. had a college education and that of these coeducational colleges furnished more than the women's colleges. About half of the women mentioned in the book are authors, with artists in the next numerical category. We dislike the use of the word "successful" in this sense as applied to women, or men either, for that matter. The great majority of the most "successful women" in America have not come sufficiently before the public to be applauded, hissed or "Who-Whoed."

A New Serum

We have the privilege of presenting to our readers this week the first complete account from the author's own hand of the preparation of the new serum for tuberculosis, which has recently attracted so much attention. Ever since the failure of Koch's tuberculin there has been an unfading hope among bacteriologists that a biological method for the treatment of tuberculosis would yet be discovered. Even in the midst of the complete failure of tuberculin there were elements of promise that could not fail to arouse great expectations. It is to be hoped that the results obtained from the employment of Marmorek's serum in the hands of others will prove as satisfactory as in those of the inventor. Unfortunately, in spite of his authority as an investigator, the prospect is not as hopeful as it might seem. Scarcely a year passes in which there is not some new cure for tuberculosis discovered and its efficacy determined by prominent authoritative clinicians. Suggestion has so important an influence on consumptive patients that any new remedy properly presented to them with the force of a new and alluring theory will always do them good. The relief inevitably proves to be temporary, however, even in those treated by the inventor of the new remedy. Patients who come under the observation of others than the original discoverer fail to be so favorably influenced

by suggestion as the first patients treated by the remedy, and then comes the lamentable disappointment. The problem of testing a new remedy is much more difficult and contains many more unknown factors than might be expected. The question must be settled by a very large experience and faithful observation for a considerable period on many patients under the most various circumstances and at the hands of observers of all kinds. Hippocrates said long ago: "Art is long, and life is short, and men are impatient." The situation is no better in our own day, and patience, sublime patience, is the only watchword of true medical progress.

■ A Liberal Russian Law

A new employers' liability law, quite liberal to factory workers and miners, has been enacted in Russia, to take effect on January 1st, 1904. The statute hitherto in force, which was enacted in 1879, applies only to railroad and steamship companies. For a quarter of a century the press and public opinion persistently urged the necessity of extending the principle of employers' liability to all industrial establishments where machinery is used. During most of this time the matter has been pending before numerous legislative and administrative committees. Under the new act the employer is made liable for

"loss of earning capacity by an employee through bodily injury, caused by labor in the establishment, while the same was in operation, or resulting from such labor."

The defense of contributory negligence is admissible only if the injury was caused "by gross negligence of the injured, not justified by the conditions and methods of work;" the burden of proof is thrown upon the employer. The familiar device of "independent contractors" is declared of no effect. In case of temporary disability the injured is entitled to one-half of his wages, in case of permanent injury to two-thirds, in case of death his family are entitled to a pension not exceeding two-thirds of his wages, the parents during lifetime, the widow during lifetime or until remarriage, and all other dependents until reaching the age of 15. All settlements between an employer and an injured employee or his family must be approved

by the factory inspector. "Contracting out" of liability is void. It will thus be seen that the new Russian law is far in advance of the antiquated rules of the common law, as interpreted in the courts of New York or Pennsylvania.

It is interesting to notice what *The New York Age*, the leading negro paper of this city, if not of the country, has to say of the proposition lately indorsed by the Union League Club. It says:

"Reduction of Southern representation in Congress is no cure for the injustice of disfranchisement; it would rather place the sanction of the Government upon it."

This is so. It would perpetuate the evil. What is needed is that the Republican Party, in its National and State platforms, shall demand equal rights of suffrage for all citizens.

It is indefinitely reported that Colombia is about to present to the Court of The Hague a complaint against the United States for its action in the Panama matter; and, more definitely, that Mr. Wayne MacVeagh has been engaged as counsel for Colombia. Very good; but first let Colombia present to the United States its claim for damages, through the usual diplomatic channels. Our Government will consider it, and possibly settle the claim; but if we refuse, then will be the time to present the case to The Hague.

We have been requested by Lawrence F. Flick, M.D., to state that when he gave to a representative of THE INDEPENDENT for publication the material for the excellent article on "Latest Methods of Dealing with Consumption," published in our issue of December 10th, he did not understand that it was to be printed with his name, but that it was to be given in the form of an extract from a report made by him. We regret that this misunderstanding occurred.

The House of Delegates of Porto Rico asks Congress that the provisions of the Constitution be extended over the island. We have from the beginning urged this cause. A Delegate with the right of discussion should be admitted to Congress, and the island be recognized as a Territory, to become later a full-fledged State,

The Fire at the Vatican

A FIRE which broke out in the Vatican on November 1, 1903, seriously endangered the library and art collection stored there. The history of the burning of the Alexandrian library by Omar might easily have been repeated in certain details if the Vatican treasures had perished by the flames that at one time threatened them. What the world lost by the fire at Alexandria can now never be ascertained. What it would have lost with the destruction of the Vatican library may be at best only faintly estimated. The collection of manuscripts, illuminated missals, books of hours and other parchments in the Vatican is unique, and the value of it as a whole cannot be measured in dollars and cents.

In addition to the manuscripts representing the work of many monkish scribes, who wrought in many cases as a religious penance, the Vatican walls are rich with the masterpieces of Michael Angelo, Raphael, Botticelli and other great masters. Ever since the middle of the fifteenth century it has been a source of gratification and pride for each succeeding Pope to augment the sum of the things artistic in the Vatican until it has now become a literary and artistic treasure house, that is rivaled by the British Museum perhaps, but by few other institutions.

The fire in question began at a quarter before eight and was happily extinguished at a quarter after eleven. Much damage resulted because of this fire, most of which was by water, but this was trifling to what might have been. A possible result of this Vatican fire may be a more liberal policy, on the part of those in authority at the Vatican, whereby the treasures there may become better and more generally known.

Mice and Matches as Fire Hazards

It has often been assumed that mice and matches are chargeable with many fires. Seldom, however, has there been so much corroborative evidence of the

truth of this theory as was found to be the case in a school house fire loss that recently occurred at Summitville, Ind. Careful investigation in this case showed that a box of matches had become ignited through the direct agency of mice. The flames left a tell-tale track from the shelf where the box had rested, up the wall to the framework of a partition wall. It was demonstrated that the matches were not exposed to heat or to spontaneous combustion.

Wax matches or matches with paraffine-dipped sticks are very attractive to mice, and they readily feed thereon. A nibble precedes a flash, and the underwriter is saddled with a loss that may be considerable. Mice and matches are more hazardous than we sometimes think.

HON. JOHN F. DRYDEN, President of the Prudential Insurance Company of America, in a little pamphlet issued by his company has this to say of life insurance as a marvelous business:

"Life insurance," in the words of De Morgan, "tho based upon self-interest, is the most enlightened and benevolent form which the projects of self-interest ever took. Stripped of its technical terms and its commercial associations, it may be presented in a point of view which will give it strong moral claims to notice." In its origin a British institution, life insurance has developed most rapidly and on the largest scale in the United States. Practically unknown in this country a hundred years ago, and of insignificant proportions even fifty years since, the last half century, and in particular the last ten years, record what must be conceded the most marvelous business success of this or any other age.

....The Chicago Fire Department is endeavoring to secure the co-operation of the Underwriters' Association of that city in the attempt to minimize the dangers growing out of the storage of large quantities of soft coal in the basements of Chicago flat houses and apartment buildings. The practice has been a growing one since the recent coal famine and has become a considerable and very dangerous hazard in Chicago.

Financial

Our Trade with Canada

THE growth of our commerce with Canada has been extraordinary, notwithstanding the preferential reduction of Canadian tariff duties on imports from Great Britain. A comparison of the returns for the calendar year now ending with those of 1893 shows that our exports to Canada have increased from \$57,000,000 to \$130,000,000, and our imports from \$34,000,000 to \$55,000,000. In these ten years the increase has been proportionately much greater, both in exports and in imports, with respect to Canada than in our trade with the remainder of the world. Our purchases from Canada have been enlarged by about 60 per cent., and those from the entire outside world by 30 per cent. Our sales to Canada show a growth of 125 per cent. in the decade, while the increase of our sales to all foreign countries in the same time has been 66 per cent.

Wages in the Steel Industry

DECLINING demand for consumption in the iron and steel industry has caused a reduction of wages, in most cases beginning on January 1st. On that date about nine-tenths of the 168,000 employees of the United States Steel Corporation will be affected by a reduction ranging between 5 and 20 per cent. Some of these have wage contracts running beyond January, but containing clauses permitting a reduction after three months' notice. Such notice was given. About 10 per cent. of the employees are members of the Amalgamated Association (union), which has an agreement with the Corporation extending to July 1st. This union will be asked to make concessions. Prominent independent manufacturers appear to have an understanding with the Corporation concerning wages, and will make similar reductions. There will be a reduction at the pig iron furnaces in the neighborhood of Pittsburg, at the Connellsville coke furnaces and at the Corporation's ore mines in Michigan. The number of men in the Pittsburg district to be affected by these changes is said to

be 80,000. It is estimated that the Corporation's expenses will be reduced by \$15,000,000, owing to this decrease of wage payments. The chief cause of this reduction has been the prolonged black-mailing strikes of labor unions in the building industry.

IT is estimated that the new wheat crop in Australia amounts to 76,000,000 bushels, the highest record heretofore having been 48,000,000.

....Germany's output of pig iron in the first half of 1903 was 4,882,271 tons; the output in this country for the same period was 9,707,367.

....Railway construction in 1903 amounted to 5,723 miles, or a few miles more than in 1902. The tables assign nearly two-fifths of the new mileage to the Southwest, and 972 miles to Oklahoma and Indian Territory.

....The output of railway rolling stock in the United States during 1903 has been 154,808 cars and 5,152 locomotives, against 164,547 and 4,070, respectively, in 1902. The cost of the 5,152 locomotives is estimated to have been \$62,000,000. Those built by the companies in their own shops are not included in the total.

....Dividends announced:

Am. Locomotive Co. (Preferred), $1\frac{3}{4}$ per cent., payable Jan. 21.
Chicago, Rock Is. & Pac. Railway, $1\frac{1}{4}$ per cent., payable Jan. 6.
N. Y. Cent. & H. R. R. R. Co., $1\frac{1}{4}$ per cent., payable Jan. 15.
Amer. Woolen Co. (Preferred), $1\frac{3}{4}$ per cent., payable Jan. 15.
Westinghouse Elect. & Mfg. Co., (quarterly preferred), $2\frac{1}{2}$ per cent., payable Jan. 11.
Southern Pac. Co., various coupons, payable Jan. 2.
People's Trust Co., Brooklyn, 1 per cent., payable Jan. 2.
Eagle Savs. & Loan Co., 4 and 5 per cent., Jan. and July.
Empire State Surety Co., $2\frac{1}{2}$ per cent. and extra $\frac{1}{2}$ per cent., payable Jan. 2.

THANKSGIVING
NUMBER

WOULD YOU WIN PLACE? Be clean, both in and out. We can not undertake the former task—that lies with yourself—but the latter we can aid with HAND SAPOLIO. It costs but a trifle—its use is a fine habit.

THE PORES are the safety valves of the body. If they be kept in perfect order by constant and intelligent bathing a very general source of danger from disease is avoided. HAND SAPOLIO is unequaled as a gentle, efficacious pore-opener.

HAND SAPOLIO neither coats over the surface, nor does it go down into the pores and dissolve their necessary oils. It opens the pores, liberates their activities, but works no chemical change in those delicate juices that go to make up the charm and bloom of a perfect complexion. Test it yourself.
